Florida oranges are getting to be a scarce commodity as the season wears on, and the price is correspondingly high. The State is full of visitors, and local demand is sufficient to maintain the price. If they seem abundant at the North now, I suspect the placard of "Florida Oranges" may be too often used to give a good name to inferior fruit from foreign sources.

C. D. D.

VALUE OF AYRSHIRE COWS.—It is the practice in many parts of Ayrshire to let the cows to a professed milkman at so much per cow per annum. This is provincially called a bowing, or boyening, from boyen, a milk pail. The farmer provides the cows and requisite dairy vessels, the whole summer pasturing and winter foddering, and houses and litter for cows, and a habitation for the milkman; while the boyoner takes the whole charge of the milking, and the management and disposal of the butter, or milk, or cheese, or whey, as he chooses. The price varies from £8 to £15. In the neighborhood of large towns it may be averaged at £15; and if to this be added the wages of a milkman or milkmaid for every eight cows, the whole expense of the cow will be £18; and the money received at 10*d.* per gallon, for 600 gallons, being but £26, there will result only £7 per annum profit on each cow; but this supposes that the milk of the cow is fairly disposed of without adulteration or trickery. Mr. Alton rates the profit of the Ayrshire cow at a higher value. He says: "To sum up all in one sentence, I now repeat, that hundreds and thousands of our best Scotch dairy cows, when they are in their best condition and well feed, yield at the rate of 2,000 Scotch pints of milk (1,000 gallons) in one year, that in general from seven and a half to eight pints (three and three-quarters to four gallons) of their milk will yield a pound of butter, country weight (one and a half pounds avoirdupois); and fifty-five pints (twenty-seven and a half gallons) of their milk will produce one stone and a half imperial weight of full milk cheese; that at the proper season, and when a healthy calf is fed, and the prices of veal as high as they have frequently been within the last fifteen years, milk will yield a profit in veal equal to three and a half pence, and four pence per pint (half gallon); and where the buttermilk can be sold, that will yield a similar profit. The quality of the milk is estimated by the quantity of butter or cheese that it will yield. Three gallons and a half of this milk will yield about a pound of this butter, country weight, or a pound and a half avoirdupois, and when one gallon of water is added to four of milk, the buttermilk is worth to the farmer two pence per gallon. An Ayrshire cow, therefore, may be reckoned to yield 257 English pounds of butter per annum, or about five pounds per week all the year round, besides the value of buttermilk and her calf."—*Western Rural.*

PLANTS AS WEATHER GUIDES.—Florists know that many plants are extremely sensitive to changes in the atmospheric condition, so the opening and closing of the flowers serve measurably as barometers. Hannemann, a botanist, of Proskan, Prussia, gives the following signs, which he has has found reliable in the following plants: The small bindweed (*Convolvulus arvensis*) and corn pimpernel, or poor man's weather-glass (*Anagallis arvensis*), expand their flowers at the approach of wet weather, whilst, on the other hand, the different varieties of clover contract their leaves before rain. If fine, bright weather is in prospect, the leaves of the chickweed (*Stellaria media*) unfold, and the flowers remain awake and erect until mid-day. When the plant droops and its flowers do not expand, rain may be expected. The half opening of the flowers is a sign that the rain will not last long. The burnet saxifrage (*Pimpernella saxifrage*) indicates the coming weather in the same manner. As to the small Cape marigold (*Calendula pluvialis*), should it open at 6 or 7 A. M., and not close till 1 P. M., we may reckon on settled weather; if the flower continues sleeping after 7, it betokens rain. With the corn-thistle and common sow-thistle (*Sonchus arvensis* and *oleraceus*), the non-closing of the flower-heads warns us that it will rain the next day; whilst the closing of them denotes fine weather. Respecting the weather indications of ladder ketnir (*Hibiscus trionum*), the stemless ground thistle (*Bandana acaulis*), marsh marigold (*Cutha palustris*), creeping crow foot (*Ranunculus repens*), wood sorrel (*Oxalis acetosella*), and other species of the oxalis genius, rain may be confidently expected when the flowers of the first do not open, when the calyx of the second closes, and when the rest fold their leaves. We may look also for wet weather if the leaves of the whitlow grass (*Draba verna*) droop, and lady's bed-straw (*Gallium verum*) becomes inflated and gives out a strong odor. Finally, the approach of rain is indicated in the case of the yellow wood anemone (*Anemone ranunculoides*) by the closing of the flowers, and in that of the wind-flower (*Anemone nemorsa*) by their drooping.—*Ex.*

EFFECT OF CLIMATE ON PLANTS.—Observations made during the Arctic Expedition have brought to light one or two curious facts in connection with the powers of growth possessed by different plants under varying conditions of climate. American research has proved that the seeds of certain plants, if gathered in one climate and sown in another, will germinate earlier or later, and with more or less vigor, according as the new climate is warmer or colder than the old. And even a perceptible change of climate is not required to show these results; a difference of a few degrees only in latitude is sufficient to do so. For example, wheat from Scotland, sown in the south of England, will germinate and ripen much more quickly than wheat of exact similar quality gathered in the South, and planted in the same latitude in which it was grown.

This fact is of the utmost importance to agriculturists. To secure early-growing wheat, it is only necessary to take care

that the seed is gathered in a colder climate than that in which it was sown. The process is perfectly practical, as it might be so arranged that the wheat sown in the North should not be consumed, but preserved for seed for the next season in the South. The same thing is noticeable among other plants, and florists and horticulturists might take advantage of this circumstance to produce both earlier and stronger plants than they do now, without the appliances for forcing. Another curious fact is that seeds—especially wheat—will stand an immense amount of cold without injury. Some wheat left in the Polar Regions by Captain Hall, of the "Polaris," in 1871, and found by Captain Nares in 1876, germinated and produced healthy plants when sown under glass on board ship.

Captain Allan Young, of the "Pandora," has on board his yacht a curiosity in the shape of a rose tree, grown in England, which has been on board ever since he left England for the Arctic Regions. When in the Polar cold the tree drooped, and to all appearances died; but as soon as the vessel reached a warmer climate the rose tree revived, and is now in full bloom, and in a perfectly healthy condition. The functions of life had been suspended while the tree remained in the cold latitudes, but they were not destroyed. This fact is curious, as tending to prove that a tree which will stand frost at all will bear almost any amount of cold; and also that, if its natural growth and development are retarded at the proper season, the plant cannot defer the revival of its development till the next normal season, but will continue its development at the first opportunity, which, in this case, after the intense cold of the Arctic Regions, occurred in the more moderate cold—the comparative warmth—of an English November. It will be interesting to see if this plant blooms naturally at the proper season this year.—*London Country.*

It is with evils as with money. Guard well the little ones, and the big ones will take care of themselves. In the matter of health, many ailments creep in through the pores of the skin. One way to prevent this is to use B. T. Babbitt's Toilet Soap, which is so pure and admirable a toilet article that it prevents and not facilitates the approach of disease.—*Adv.*

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

☞Several answers to correspondents crowded over until next issue.

AUGUSTINE, Cincinnati.—We have answered your inquiries fully by to-day's mail.

STANHOPE, Trenton.—Yes; some English snipe are killed on the Delaware marshes, near Philadelphia. They generally remain from about 1st of March until June, unless driven off by the gunners.

S. P. B., Dartmouth, Mass.—Is there any authenticated account of the living capture of the bird of Paradise by an European explorer? If so where may it be found? Ans. We know of none.

J. E. H., Boston.—Will you inform me of some good, reliable breaker in the vicinity of Boston? Ans. Franklin Summer, Milton, Blue Hill P. O., Mass., is said to be a good breaker.

C. A. B., Newton.—Please give me the pedigree of setter dog "Ned," owned by J. A. Lakin, Westfield, Mass. Ans. "Ned," red-and-white setter, whelped June, 1871, by Wilkinson's Frank, out of an imported bitch, name not given.

E. O. F. G., Phila.—What is the best food for a setter-bitch just before she pups and while she is sucking them? Ans. Mush of corn or oatmeal with meat-scraps (cooked), with a liberal allowance of milk while sucking.

R. B. B., Sparta, Ga.—What is about the proper pattern and penetration for a cylinder-bored gun (breech-loader), 8 pounds weight, 12-bore, 30 inches length of barrel, 1⅛ ounce No. 6 shot, and 3 drachms of powder. Ans. 125 pellets would be a good pattern; we cannot name penetration, as we have nothing here to gauge it by.

H. W. M., Manistee.—Do not experts claim that as good off-hand shooting can be made with a three-pound pull, as with the hair trigger? If so, why? Ans. Yes, and in the shooting-galleries, where hair-triggers were formerly used altogether, they are being superceded. A more deliberate aim can be taken where a gradual pressure on the trigger can be used.

H. W. WILLIAMS, Lakeville.—Judging from your description, the animal in question is probably a Fisher, *Mustela Pennantii.* There are several points, however, in which this animal differs from yours—in color, for example. Why not send the creature to the Smithsonian Institution, where it can be examined, and pronounced upon by the highest authority in the country?

A. J. N., Syracuse, N. Y.—Have experiments been made to ascertain what volume of gas, under specified pressure, a given quantity of gunpowder will make when ignited? and if so, with what results? Ans. Powder, when ignited, will generate 2,800 times its bulk in gas. When closely confined, it will give a pressure of about 5,000 pounds to the square inch.

HELLAM, York, Pa.—Can you furnish me with a copy of "The Setter," by Edw. Laverack, latest edition; also, a copy "Setters and Pointers," by Elbert S. Carman; if so, at what price each? Ans. Mr. Laverack's book can be had from W. Wood, publisher, 27 Great Jones Street. Mr. Carman's book was printed for private distribution, and we do not think a copy can be had.

F. L. R., Longwood, Fla.—Can you tell me anything of the pedigree of an English pointer, known as Mack, or Old Mack, who was brought from Liverpool to the United States some time between 1868 or 1869 and 1872? Ans. Without more definite information as to when he was imported, and by whom, we cannot.

FORTY-ONE, Washington, D. C.—1st. What is the best reel to use for bass fishing? 2d. Is the Boston salmon fly a good one to use for bass? 3d. How would you place the Dobson on the hook, through the head or tail? Ans. 1st. Meek reel, made in Frankfort, Ky. 2d. Yes. 3d. Put the hook in his body, and bring the point out of the shoulder.

DON, Harrisburg, Pa.—1st. Who is agent for Tatham's New York shot? 2d. What firm, in Philadelphia, can you recommend as the most reasonable and reliable for buying Ely's caps, wads, and other sporting material, in wholesale quantities? Ans. 1st. Tatham & Bros., No. 82 Beekman Street. 2d. John Krider, Second and Walnut Streets, or Jos. C. Grubb & Co., No. 712 Market Street.

B. P., Pittston, Pa.—My setter pup, eight months old, has diarrhœa. What shall I do for him? Ans. Give your dog a tablespoonful of Rochelle salts, dissolved in water. If this does not check it in a day or two, give the following: Prepared chalk, 2 drachms; tinct. opium, 5 drachms; powdered gum arabic, 2 drachms; water, 6 ounces. Mix and give two tablespoonfuls every time the bowels are relaxed.

R. N., Philadelphia.—1st. Can a No. 8 gun be altered to a breech-loader? 2d. If yes, about what would be the cost? 3d. What will be the calibre of, and what the number of the shell for, the altered gun, and can shells of that size be purchased in the stores? Ans. 1st. Yes. 2d. About $40. 3d. The same as before, and shells can be bought in any quantity.

TRAP, New York.—1st. Will you please tell me what is the season for trout on Long Island? 2d. Where can I have a good day's fishing not far from New York? What kind of flies and lines are the best? Ans. 1st. You can fish now. 2d. We will guarantee you a fine mess of fish in Seaman's Pond, Ridgewood, about thirty miles from Brooklyn. Terms very moderate. For flies see "Sea and River Department" of this paper.

G. A., Jr., New York.—Do you think that a party of four could "have a good time" in the fishing line, by hiring a small sail-boat and camping out on the Sound shore for a week or so? Where would you recommend us to go? Ans. The very best place we can recommend is among the "Thimble Islands," off the Connecticut shore, opposite Branford and Guilford. You can hire boats there, and every convenience. We can hardly imagine a trip more enjoyable than the one suggested.

W. A., New York.—Will you be kind enough to tell me where are any good English snipe-grounds within a short distance of the city, say a two-hours' ride or so? How can I best tell just when to strike the flight? By answering you will greatly oblige a constant reader. Ans. On the meadows about Hanover Neck there is usually good spring snipe-shooting. If you will address Henry Walker, Hanover Neck, Morris Co., N. J., he will arrange to telegraph you when the snipe appear.

W. T. G., Jr., Concord, N. H.—1st. I want to go camping next summer, in July and August, to *first-rate* hunting and fishing-grounds. Would you advise me to go to Maine or the Adirondacks, and to what place? What game shall I be likely to find there? 2d. Is a rifle or a shot-gun the best? 3d. Does it injure a fine shot-gun to shoot buckshot or Ely's wire cartridges? Ans. 1st. We should prefer Maine, in the vicinity of Moosehead or Rangely Lakes. 2d. A shot-gun. 3d. Not if the gun is not choke-bored, and if the buckshot chamber is in the muzzle.

R. FRENCH & Co., 1,933 Mt. Vernon Street, Philadelphia.—Last January, we caught an animal in our trout ponds, which had been eating our trout, and have been unable to find out what kind of animal it is. Its head resembles a cat's body, a dark brown, 14 inches in length, nearly white under the belly, tail 12 inches in length, triangular in shape, six toe-nails on each foot? Ans. Impossible to tell from the description just what it was; probably a marten. But how about *six* toe-nails on each foot?

TOP SNAP, Cazenovia, N. Y.—Please give receipt for making cement to fasten glass in aquarium? Ans. The best cement for fastening the glass in the tanks is made in England. A good cement, suitable for salt or fresh water, is made by taking two parts, by measure, of litharge, the same of plaster of Paris, a little quantity of white sand, and one part of finely powdered soda. Mix, when wanted for use, with boiled oil sufficient to make it of the consistency of stiff putty. It is better to allow it to stand three days before using.

S. F. G., Mount Airy.—1st. What is the proper charge of powder and shot for a Deau breech-loading gun, No. 12 bore, 20-inch length, for quail and robins? 2d. What is the best way to commence to break a pup to the gun? 3d. What is the price of Thomson's gunning coat? Ans. 1st. You do not give the weight of the gun; we should say three drachms powder, and one ounce shot. 2d. Buy "Dinks, Mayhew & Hutchinson," for instructions; we cannot spare the space to give them. 3d. $4.50 to $10.00.

F. H. J., Albany, N. Y.—Will you please tell me what length of time the dose required for the dog of G. D. K., Carlisle, Pa., as given in your number of March 15th, should be continued, and what the quantity of a Dover's powder? I have a 60-lb. setter, which has a cough similar to one described. Ans. Three prescriptions are named, the first two to be given for two or three days, or until some sign of improvement was discovered, when they could be alternated. The remedy for canker should be continued for a week. When a Dover's powder is prescribed, it means ten grains.

POT-HUNTER, Rosedale, Kan.—1st. Will a salt codfish attract pigeons to it? If not, what will, when set near a dove-cot? 2d. Is Parker & Brothers' $75 breech-loader considered a safe and reliable gun? 3d. What is the best bait for catfish? Ans. 1st. We have heard that salt on a bird's tail will ensure their capture, but never of a salt codfish being an accessory. Grain, scattered in the vicinity of a dove-cot, will attract them. 2d. Yes. 3d. Catfish will take almost any bait. A piece of raw meat, minnows, or worms, are all good.

M., New York.—1st. Would you let me know, through your valuable paper, whether Saltus' "Dash" is the same dog that Mr. Colburn sold to Mr. Saltus? 2d. Also, if La Montagne's "Dash," registered in last week's edition, is not of good stock? 3d. Can you furnish me with Saltus' "Dash's" pedigree? 4th. Is the pointer, "Sensation," of a first-class stock? Ans. 1st. No; Mr. Saltus bred "Dash" himself. 2d. Yes; no better native stock in the country. 3d. "Dash" was sired by Gubner's, afterward Robinson's, "Jack," he by Putnam's "Dan," out of imported "Belle." "Dash's" dam was Saltus' "Frisk," by Louis Schwartz's dog, out of "Duck." 4th. Yes; none better.

W. L. A., Waynesburg, Pa.—Two or three weeks ago I noticed my dog licking himself on the rump, just in front of his tail, and found an ugly looking sore there about the size of a silver half dollar. The rest of his skin was white and clean. Now another sore just like the first has made its appearance close to the first one. He has had a clean dry kennel and been well exercised. He appears lively and don't scratch himself. I feed him mostly scraps from the table, except meat. He is fond of stale bread made moist with hot water. Ans. Make an ointment of Basilicon ointment, 2 oz.; flour of sulphur, ½ oz.; spirits of turpentine sufficient to make of the proper consistency; rub well in. Your course of diet is right.

S. C. C., Syracuse.—I use in my gun—10-gauge, 9-lb.—brass shells 2½ inches long, loaded with from 3 to 5 drachms of powder, and 1¼ ounces of shot; use two Ely's wads over powder, and a Baldwin over shot. At 40 yards, 30-inch circle, the target is "no good." A sitting duck would easily escape. Can you give any cause for such behavior? Ans. Several explanations can be given. First, your brass shells probably do not fill the chamber of your gun as they should. Again, you are probably using too much powder in proportion to the charge of shot, the effect of which is always to increase the pattern. Try 3½ drachms, and 1¼ ounce shot; or, 4 drachms, and 1¼ ounce shot, and use one pink-edge wad over powder.

ATSTINY, Portland, Me.—We would gladly publish your letter, if we thought it would have any effect; but it will not. You have stringent laws in your State for the protection of game, and prohibiting its being sent out of the State? It rests with the people of the State to see them enforced. If they permit O. E. W., and others, to slaughter their deer with impunity, and ship the venison to Boston, they must be content to see the deer exterminated. No amount of "newspaper talk" will affect persons who, as you say, attack deer with clubs and knives, in their yards and in the deep snow. Some of them must be made examples of in the courts, and then, perhaps, the evils you complain of will cease.

DIX, Ypsilanti.—1st. I have a fine setter bitch, nearly four years old, and I am anxious to get some pups from her. She had one litter when she was about two years old, but has had none since. During the last weeks of October last, I thought her in heat, and she visited a dog, but with no result. Is there anything I can give her to bring her in heat? and if there is, would you advise the use of it? 2d. Do you consider the straight shell, for rifle shooting, any better than the bottle-neck? Would like to hear something of their relative merits. Ans. 1st. There is no reason why your bitch should not be in season at the regular intervals. Possibly, in October, you sent her too late. She should now come in season again, and you can hasten it by giving her "Dinks'" prescription, viz., seven drops tincture cantharides, twice a day, until the effect is produced—probably six days. We should not hesitate to use it in such a case. 2d. Much depends upon the description of the rifle. The bottle-necked shell is very generally used by our riflemen.

F. DE B., Ithaca, N. Y.—1st. I have a smart, little spaniel bitch, nine months old, which I intend to use in the Brown's Tract region next summer and fall. If she is kept from a dog (in times of heat) permanently, will she be likely to get in heat more than twice a year? and if she does, will it make her troublesome about hunting? Should I have her spayed? 2d. A friend and myself intend to go to Boonville, N. Y., by water, in the Nautilus canoe, which Fairchild went to Florida in last year. Can we find good bass fishing in Oneida River? Are there any brook-trout in the Oneida Lake, and region? I have a new No. 10 Remington shot-gun ($75). At times, I think it scatters too much, from too quick powder. Please name some powder that will give good penetration, and is rather slow. Ans. 1st. Your bitch will not be in heat more than twice a year, and, if away from a dog, may show some disposition to wander. She should be kept on a chain at that period. She is too old to spay. 2d. Plenty of trout in the region you name, but we doubt if you find any bass. 3d. Use the coarser grades of powder, say Hazard's Ducking, No. 4, or some other, corresponding in size.

RURAL, Hagerstown, Md.—1st. Is the $12 watch, advertised in your paper by J. Bride & Co., really a good time-keeper? 2d. Do you think it would keep good time and wear as well as a $25 silver watch? 3d. What do you charge for binding the FOREST AND STREAM, when parties furnish their copies? 4th. From what year does your paper date its existence? 5th. What is the smallest quantity of Kay's concentrators that can be bought at retail, and whose make of shot are they loaded with? 6th. I see, in a February number of the *Red and Gun*, that Mr. South, the champion pigeon shot of the West, is having a Greener gun made that will kill at 75 yards. Can a gun be made to kill with any certainty at 75 yards? 7th. Can a pointer that has no pedigree be entered at a Bench Show? 1st. Yes; we have tried them. 2d. Possibly. 3d. $1.25. 4th. August, 1873. 5th. One dozen. Tatham's shot, we believe. 6th. We do not believe that a gun can be made, and the shooter found at the same time, to kill constantly at 75 yards, although that such shots are sometimes made. 7th. Yes; pedigrees are not required except in case of a tie.

C. H. B., Plainfield, N. J.—1st. Does the history of the English sparrow show it to have been at any time a migratory bird? I noticed one day, during the extreme cold weather of last month, that all the sparrows in the town where I live were flying together in large flocks, turning and wheeling, with the precision of black-birds, and occasionally settling down on the top of some building, with the most incessant chattering (but no fighting), then presently high-up in the air again, and "to and fro," over the town. I thought they were going to leave, but next day, I found them scattered around at their regular feeding places? 2d. Is there a biography of Herbert in the 1st volume of his Field Sports. A portrait of the author, said to be a good one, is in the same volume. Zimmerman, of St. Paul, Minn., has also published one. Herbert's death was caused by suicide, at the Stevens House, New York. 3. The blue birds often appear in New Jersey as early as March 1st.

New Publications.

THE MAGAZINES.

Scribner's, for April, contains an unusual number of illustrated articles. First, is one entitled "Chincoteague," in which Mr. Howard Pyle describes the peculiarities of that famous resort for sportsmen, with its queer inhabitants and its droves of wild ponies. The chief paper in this number, in point of illustrations, at least, is one entitled "Some American Sporting dogs," by the Associate Editor of this paper. Mr. Tileston has had no easy task to compress a subject with such range into the limits of a magazine article, but for the novice in canine matters the paper contains some useful hints. The artist, however, has had full scope, and the result is some of the finest specimens of dog portraiture we have ever seen. Mr. Richardson describes his "Trip to the Black Hills," with illustrations of Custer City, Deadwood, etc. There is also a portrait of the scout "Wild Bill," lately murdered. The serials, Dr. Holland's "Nicholas Minturn," and Mrs. Burnett's "That Lass O'Lowrie's," are continued, and the latter draws near its end, the concluding chapters being advertised for the next issue. Mr. Geo. E. Waring, Jr., contributes a valuable paper on "Farm Villages," and Mr. Clarence Cook another of his interesting articles on "Beds, Tables, etc." There are several short sketches, tales, etc., and the usual Bric-a-Bric, miscellany, etc.

St. Nicholas seems scarcely as good a number as usual, but we doubt not that the children are satisfied with the Bill of Fare presented for them. The short stories, all handsomely illustrated, are almost too numerous to mention. One of the neatest and most appropriate, is Lucy Larcom's "Songs of Spring." The story of "Pattaikin's House" is continued, and so is Mr. Trowbridge's serial entitled, "His Own Master." The same author contributes a "Talk with Boys," which contains some sound advice. Professor Proctor continues his instructive illustrated articles on Astronomy, describing the science and positions of the stars, in a manner suited to the juvenile mind. The Natural History article is contributed by Mr. W. K. Brooks, and is entitled "Something about Birds." Some of the illustrations, accompanying this paper, are superb, notably, those of the rise and flight of wild geese. Jack in the Pulpit, has a bright assortment for his friends, and there is a story in French, and something in large type for the very little folks.

The *Galaxy*, for April, opens with a paper by Henry James, Jr., entitled "The Theatre Francais," really a review with the writers own annotations of the series of papers by M. Francisque Sarcey, now appearing in the Librairie des Bibliophiles, and comprising biographies of French actors and actresses, who have reached the distinction of "*de la Comedie Francaise.*" Mr. Justin McCarthy's novel, "Miss Misanthrope," is continued; it is not as entertaining as other works by the same author. "About Cigarettes," tells us how this discription of cigar is made, and gives a good account of the factory of "Honorades," a name familier to all smokers. Mr. Elliot deals with the difficult problem of "Hard Times, or What Shall We Do With Our Cheap Labor," and Mr. Richard Grant White has a very entertaining paper on "English Traits," in which some very just, if not strictly orthodox, comparisons between the men and women of Great Britain and this country are drawn. There are the usual number of short sketches, a capital collection of Scientific Miscellany, "Drift Wood," etc., etc.

STANDARD FACTS AND FIGURES; or, "What You Do Know," "What You Don't Know," "What You Want to Know, published by Morton & Dumont, 160 Fulton Street.

This handsome pocket volume, which was issued last year through some of the most prominent bankers in New York, Boston, and Philadelphia, having been carefully revised and enlarged, is now ready for delivery. It embraces in the smallest possible compass, practical information in Banking, Dry Goods, Cotton, Wool, Coffee, Sugar, Tea, Iron, Petroleum, etc., and has an article, prepared by Risk & Hatch, on Government Bonds, which is excellent. This volume has received the endorsement of some of the most prominent men in the country. A book of this character, in pocket form, containing such desirable information, has long been needed.

FOREST AND STREAM

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

Terms, Four Dollars a Year, Strictly in Advance.

Twenty-five per cent. off for Clubs of Three or more.

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line; outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

*** Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, MARCH 29, 1877.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

☞ Trade supplied by American News Company.

CHARLES HALLOCK,
Editor and Business Manager.

OUR NEW TYPE.—*Forest and Stream* appears this week in a full dress of new type, which we hope will please our near-sighted and aged readers, as well as the rest. Types are bound to wear out in a short time, whatever may betide the editors; but the editors of this paper are good for some time yet; while the fact of our investment in new type shows that we have faith in its continuance and stability.

By why don't more of our readers interest themselves to get up clubs? Three dollars for a twenty-page paper like ours is cheap, isn't it?

THE WEATHER FIFTY YEARS AGO.—A friend has sent to us an extract from an old Philadelphia paper, date of 1830, showing an interesting meteorological observation of "spring weather," in that year, which may prove of some interest now, as a comparison, in subject of the views of some who claim that our climate has undergone an entire change. From it we learn that on the 1st of March large flights of robins, with cow-birds, and blue-birds, were observed. Snow drops and hearts—even in flower. Two vessels sailed up the Schuylkill. On the 2d of the month, snow fell to the depth of eight inches, and there was fine sleighing on the morning of the 3d. (The last week of February had been mild). With thaw and rain, the snow disappeared by the 9th. On that day it grew cold again, and ice formed an inch in thickness. March 10th, thermometer 44 degrees in the shade; the warm weather bringing crowds of black-birds and ducks on the 11th. Warm weather continuing, peas and potatoes were planted on the 15th. There was a light frost on the morning of the 19th—thermometer 54 at 3 P. M. Spring frogs heard piping. 22d—Large flocks of wild geese flying north. 23—Thunder storms. 24th—Thin ice. 25th—Snowing in the evening, and changing to rain on the 26th. Large flocks of wild pigeons going South. Fine weather the next four days, and rain on the 31st. April 1st, apricots in bloom. On the 27th was a smart frost, the last of the season.

We have the reputation in this country of building some rather queer railways, but they beat us all hollow in Canada. At a recent examination before the Government Committee on Railways, it was discovered that many of the embankments in the Western Canada Railway, was built of *brush* and *logs* with a little dirt on top.

One of our Virginia exchanges tells us of an aged colored woman in that vicinity "who has been making bread for one family for the last fifty years. Three cheers for the Old Dough-minion."

FOREST FIRES IN FLORIDA—BURNING FOR THE CATTLE RANGES.

THE tenth of March is a "red letter day" in Florida, for it begins the season of the annual burning of the woods. One would think the lurid flames that stream up all over the country would entitle the day to be marked doubly red in the calendar. All round about the dense, dark smoke rises above the forests, urged upward by the hot flames, and at night the horizon for miles is reddened with the glare that tells of the sweeping devastation. The dry grass and bushes the "pine straw" or fallen leaves of the pine, the scattered legs of "light wood," or dead pitchy meat of the tree, and the living pines themselves, furnish the fire with material; and to what limit its ravages would extend were it not for the occasional rainfall one could not tell. Many a rail fence meets what might be called, when the inflammable nature of the material is considered, its destiny, and leaves where it once stood but a charred zig-zag track, which may serve to guide the farmer in putting up another one after he has "mauled" out some new rails.

The stranger might think these fires accidental, or due to some one's carelessness; but there is no accident about it. It is an act to promote the welfare of the numerous cattle who range the woods for subsistence, and find therein but a very meagre one. Florida woods furnish various tender, wild flowers and berries, but the grass is of the "wire" kind, and though tender and nourishing when young, by winter it becomes dry, tough, and wiry, and shows no disposition to decay. The Floridian stock-owner, therefore, as soon as the law permits, applies the match, and away goes the fire, sweeping through the woods, reducing everything on the surface to ashes, and licking upward about the tall pines, often to their utter destruction.

It is not a pleasant sight to ride through the woods after the burning. The desolation is almost complete; the earth is a blackened waste; half burnt bushes, mutilated, scorched, and withered palmettoes, everywhere about, and nothing of verdure except we look high above to the foliage of the trees. What is more suggestive of luxuriant tropical growth than the bushy palmetto? Tough, elastic, and vigorous, it opens its multitudes of large, jagged leaves to the sun, even in the most barren places and under the most discouraging circumstances. A mighty determination to live is written all over it; but it stands in the burned waste, overcome, shorn of its vigor, and marred of its beauty.

But this impressive desolation is only transient. The stock-owner burned the woods to get new, tender grass for his stock, and in a few days it comes springing from the ground through the ashes. The palmettoes, too, and other shrubs, will put forth new leaves, and out of this general death will spring a new and, perhaps, more glorious life. The cattle understand it all, and gather on the "burn" thenceforward to browse, while endeavoring, if possible to clothe their lean sides with a little more flesh.

It is generally conceded in Florida, that, the burning of the woods brings better grass, and therefore improves the condition of the stock: but one may question whether the end gained is worth seeking, when the quality of the stock is taken into consideration, and the fact that the destruction of many pine trees necessarily results. Cattle are cheap, and their meat inferior—one might almost say, unfit for market purposes. The value of a large herd is mainly for manuring, which is done by the system of "cowpenning;" but the yellow pine, with its standard commercial value, it would seem worth while to protect the growth of, even if the cattle do not make out so well. However, the Floridian values his stock—and the pine trees—well, the woods are full of them yet, so the range is burnt over.

Men who are extensively planting orange groves would be glad to see some other system of keeping cattle, or else have their presence dispensed with, for that very common reason, the necessity of fencing; and it may be that the time will yet come when the orange interest will be so extensive that the cattle interest will naturally yield to its welfare.

THOUGHTS ON EDUCATION.

THIRD PAPER.

THE questions here suggesting themselves are, What is the true order of education? and, Which are the best schools for the young? A very prevalent error seems to be this, that education consists in cramming into a child's brain as much knowledge as it will conveniently or inconveniently carry, and leaving its muscles and morals to take care of themselves. The sooner we get rid of this delusion and act upon a truer knowledge, the better it will be for the rising and for all future generations. The fact is known, though somehow it but seldom obtains practical recognition, that there are teachers graduated from no normal school or college, and schools not built of brick and mortar. When this truth is fully understood and digested, the discovery will follow that what ought to be considered the natural order of education, has been inverted—that instead of neglecting the moral and physical systems, and devoting the whole energies to rearing the intellect, the former should be the ground-work upon which to raise the intellectual superstructure. A boy may show genius sufficient to warrant his guardians predicting for him the career of a Faraday or a Morse; but, how often, merely for lack of moral backing, does the genius turn out worthless? The value of truth, perseverance and energy, without genius, is greater to the possessor, and to the world, than genius without any moral quality to make it available. This is witnessed in business circles every day, the plodding dullard rising to be a credit to himself and a benefit to humanity; while the vacillating, purposeless *genius*, with ten times his ability, is lost in the distance behind him. If it be said that a genius should never be hampered with the drudgery of business, we might quote the instance of the poet, Morris, to show that the two are not incompatible. Genius engages in business, but is never lowered by it. Burns could guide a plough, or measure a beer barrel, and yet write "The Cotter's Saturday Night," and "Tam O'Shanter;" any how many sweet songs have been sung by men engaged in more—shall we say degrading—labors than these? For our present purpose, the case may be taken of men and women of genius, whose course has not been disturbed, or, if disturbed, not turned. Let us look for a moment at Byron, and, if we can, admire without pity the poetical talent which could find a refuge in describing the unwholesome career of a kind of wandering debauchee. *His* genius, at least, was as free as air, unhampered, and untrammelled, with all the accessories of time and circumstance, place, position, and association, for "nourishing a youth sublime." He wantonly threw away his opportunities, and while thousands consider "Don Juan" a stain upon his memory, in the recollection of thousands more he lives as anything but a great man, whatever be his rank as a poet. With all his power he had no moral stamina, no quality to carry him over the mingled smiles and frowns of a capricious mother, the fickle favors of an equally capricious world, which pleased him one moment, to have the better chance of abusing him the next, or the sad disappointment of being called "a lame boy" by the woman he loved. In short, his moral education, as far as the evidence goes, was totally neglected. His stupendous intellect found no counterpart in his nature, upon which to lean for support and guidance, and urged him along a misguided and unworthy course; he wrote as he lived, in defiance of every law, human and divine; and, in considering his works, we might be lost in admiration of the poet's genius, did we not find ourselves so often brought face to face with the comparative pigmy to which it belonged.

Swinburne is another example of peculiar moral obliquity, whom it is equally hard to acquit, or condemn. Listening to his praise of love, one could imagine him living in a continued ecstacy. Genius he has, and that of the brightest. Few poems in the language will be found to excel his "Watch in the Night." There is no more glowing imagery, no more luxuriant imagination, no more silvery tongue than his, whether he sing of the victims to the French Revolutionary rage, bound hand and foot, and plunged into the Loire, or of the imperious Faustine. But we cannot help recoiling from the outpouring in such lavish profusion of the praises of Venus. At times the poet seems to forget, or, if remembering, to ignore, the story, that besides the Goddess of Love, the shepherd of Ida was visited also by the stately Juno, and by the warlike, wise, and chaste Minerva. The general impression derived from his poetry is that his harp is an instrument of one string, and though its note is wondrously beautiful and wild, it wearies with its monotony. Some volcanic disturbance of his system may account for his tendency, but in no way excuses it. We cannot think of a man with an originally sound and trained moral constitution being so led away as to live and riot in the morbid and impure.

The moral of both careers is obvious. Unless a sounder foundation is laid than mere intellectual cultivation, any of the incidents to which all are exposed may reduce a noble life to a veritable wreck, over which we may bring ourselves in erecting a light-house, to tell our fellow-mariners where it lies engulfed in the sand. Enough has at least been said to show that while devoting the energies to the fostering and rearing of the intellect, it is just possible that the better part of a youth may be neglected, and so virtually destroyed.

REMINISENCES OF LIFE IN CHINA.

A note from a correspondent regarding the Flobert Rifle, which is printed in another column, brings to mind such a comical event that happened to us some years since, in which these rifles played a conspicuous part, that we cannot help telling the story. It was away back in '63 or '64, and the scene the newly opened trading port of Hankow, on the River Yang Tsze, some six hundred miles from the coast in the interior of China. Our companion at the time was George Potts, a well-known New Yorker, who now lies in Happy Valley. During the long fall and winter, when the low water left us at times for weeks without communication with the outside world, we amused ourselves with two Flobert rifles, until, after constant practice, we could hit silver dollars almost as far as the rifles would carry accurately. The house, which had a wide verandah in front, stood directly on the river bank. On one side was a narrow alley leading to the river, and through this alley a continuous stream of coolies passed all day, one line going to the river with their empty buckets slung on the ends of a bamboo pole, and the other file returning with buckets filled with water for distribution throughout the city. When every other resource failed, we would take our stations behind the closed blinds of the verandah, and, each selecting a bucket, would bore a hole through it as neatly as though done with an augur. The monotonous cry of "A-ho! A-ho! A-ho!" proceeding from a hundred or more throats, entirely drowned the slight report of the rifles, and it was not until the coolies had reached the head of the alley that the increased weight on one end of the bamboo, and the diminution of that on the other, acquainted them with the fact, that nearly half their load had escaped. This went on undiscovered for some time until, on one unlucky day, a bullet from Potts' rifle glanced from the wet side of a bucket, and striking the coolie on the foot, made a slight furrow across the instep. The howling and shrieking that followed was something fearful, and not knowing what might happen, in the unsettled state of the native feeling toward foreigners, we hastened down and dragged the man into the house enclosure, when, with one hand grasping his wounded foot, he danced around on the other with an agility that would have done credit to a dervish.

Potts was in despair, until remembering that among the traps, which his thoughtful mother had prepared for his use, was a box of Dailey's Pain Extractor. This I suggested should be brought down at once, and Potts having gotten it, we spread some thickly on one side of a silver dollar, and placed it on the wound. When the Coolie saw the dollar his shrieks ceased, and his foot being bound up with this novel plaster still on it, he hopped to the gate in double quick time. We never heard of him afterward; but the next day all the coolies in town were on hand, to be shot at at a dollar a head.

WAR ON THE GRASSHOPPER.

THE Commission appointed by the Government last week to study up the habits and habitat of the American grasshopper, and discover, if possible, some method of exterminating him, consists of Dr. L. V. Hayden and Prof. Henry, of the Smithsonian Institution; Prof. Riley, Michigan State Entomologist; Cyrus Thomas, Illinois State Entomologist; and Dr. Packard, of the *Naturalist*. They have gone to St. Louis, and will at once enter upon their campaign. The Commission has mapped out the region west of the Mississippi and east of the Rocky Mountains into three districts, in each of which a member of the Commission will devote himself to studying the insect, and an excursion is to be made to Canada for the purpose by Prof. Riley and Dr. Packard. The parasites, embriology, development, and range of the insect, with a study of the insect, and the meteorological conditions favoring its growth, will each be the object of special investigation by the members of the Commission, to whom this work will be assigned by topics. Bulletins will be issued from time to time during the summer, embodying the researches of these naturalists and the progress of the grasshopper.

We have heard great stories of the innumerable multitudes of grasshoppers and their ravages. We have seen settlers abandoning their homes from which these insects had starved them. Serious indeed must be the cause that would compel a man to abandon property that has cost him thousands of dollars. It has been supposed that the flights of grasshoppers were as countless as the sands of the sea, but a careful mathematical computation shows that there are often sixteen hundred and two millions to the square mile. Prof. Riley, a member of the Commission, in his report (1875) on the "Noxious, Beneficial, and other Insects of the State of Missouri," says that the grasshoppers found on this continent are of three kinds. First, is the *Caloptenus spretus*, distinguished by the length of his wings, which extend, when closed, one-third of their length beyond the tip of the abdomen; second, the *Caloptenus femur rubrum*, or common red-legged grasshopper, with shorter wings; third, the Pacific migratory locust, *Ordipoda atrox*, more than an inch in length, with several roundish spots on back and wings, and a dark fuscous spot behind the eye, which is seldom seen on this side of the Pacific slope. Their habits, and the treatment required by each, are the same. The first-named species (the *spretus*, or hateful) is that which invades and devastates the prairies. Their natural breeding-ground is in the arid plains of Colorado, Utah, Idaho, and Montana, to the south and west of the Mississippi. They are generally, therefore, called Rocky Mountain locusts.

These insects pierce nest-holes in the surface of the prairie, drilling them out with their abdomens, and depositing an egg-pod therein, which contains from thirty to 100 eggs. The pod is three-fourths of an inch long. When deposited it is covered with earth. From the eggs the young locusts emerge, each kicking off the white skin which enshrouds it, and the larva is at once a locust. As it grows its skin distends until it bursts, and the locust comes forth in a new garment. It is now called a *pupa;* the knobs on its back gradually grow into wings, when it is a full-armed locust.

Their visitations are periodical. The Jesuit History of Missions in California states that the year 1722 was disastrous. They came again in 1746, continuing three years; next in 1753, 1754; afterwards in 1765, 1766, 1767. Within the present century the periods of greatest destruction were 1828, 1838, 1846, and 1855. The locusts extended themselves in one year over a surface comprised within thirty-eight degrees of latitude and eighteen degrees of longitude in the broadest part. (See article on "Grasshoppers and Locusts of America," in Smithsonian Reports for 1858, page 200.)

Since Lord Selkirk's settlement in Manitoba in 1812, the locusts have appeared in 1818 and 1819; then not until 1857 and 1858; next in 1864 and 1865, doing little injury; then in 1867, 1868, 1869, 1870; and again in the last three years. Since the settlement of Minnesota there have been six grasshopper years in that State, 1856, 1857, 1865, 1873, 1874, and 1875.

It is a curious fact that the immunity of any particular district for grasshopper ravages may turn upon the fact of a bright sun and clear sky, through which they move on, but settle down into the shrubs and grass as rain approaches. They prefer unripe cereals and juicy grasses, and will pass peas and beans, unless hard pressed.

Very many are the natural enemies of the grasshopper. There is the ichneumon fly, and another fly, called *tachina sarcophaga;* the red pacantes, found near the base of the wings; birds of various kinds, the domestic fowls; and buffaloes, which trample them. Of mechanical means, early ploughing is successful to some extent; a green hedge of peas or beans around a field, with a supplementary ditch of water, will protect the grain; burning, beating with bushes, drowning in ditches, and other methods are employed, with more or less effect. We trust the Commission just appointed may be able to devise some contrivance more effective than any of them have yet proved.

By the way, Prof. Riley expresses a favorable opinion of edible qualities of the grasshopper. The insects yield, he says, an agreeable, nutty flavor when they are fried in butter; often the wings and legs are removed. Palatable soups may also be made of them. The Indians roast them; and John the Baptist, we are told, used to banker after them.

GAME PROTECTION.

NEW YORK STATE SPORTSMANS' ASSOCIATION.—The joint committee of the Onondago and Central City Clubs of Syracuse, having in charge the arrangements for the next meeting of the New York State Sportsman's Association, held a meeting recently, and appointed the following committees: *On Fish Exhibition*—D. H. Bruce, Reuben Wood, James Geddes. *On Dog Show*—Lucius Moses, Howard Soule, Jr., Henry Gale. *On Birds*—John A. Nichols, John Bedford, P. J. Brumelkamp. *On Fly Casting*—James Geddes, Reuben Wood, D. H. Bruce. *On Pistol Shooting*—W. S. Barnum, Frank Denison, Geo. Lodder. *On Rifle Shooting*—D. H. Bruce, George W. Edwards, Frank E. Carroll. *On Trap Shooting*—Frank B. Klock, John Bedford, Howard Soule, Jr. *Finance Committee*—S. W. Sherlock, Frank B. Klock, Frank E. Carroll. *Reception Committee*—Frank E. Carroll, Thos. Townsend, Thos. Kimber, Jr., R. W. Jones, W. H. Larrabee, Frank Denison.

It was voted unanimously to hold a Bench Show of dogs.

There will be some innovations this year on the old plans and schemes under which the association has met for so many years. Among them will be rifle shooting, on all ranges up to 1,000 yards, under the rules of the National Rifle Association. This change alone will be appreciated by riflemen everywhere.

MASSACHUSETTS.—An adjourned meeting of the Massachusetts Anglers' Association was held in Boston, Wednesday evening, March 21, congratulatory on the passage of the Lobster law; leave to withdraw on the petition of parties to change the Smelt law; and change of name to Massachusetts Fish and Game Protective Association. Dr. John P. Ordway, the President, reported that the bill changing the name had passed the House and would undoubtedly pass the Senate.

Mr. Horace T. Rockwell, from the Committee appointed March 7 to confer with the different game Clubs, in regard to the subject of Club admissions to membership in the Massachusetts Fish and Game Protective Association, submitted a report and recommended the passage of the following vote, which was done:

Voted, That the Massachusetts Fish and Game Protective Association invite the several Fish, Game and Sportsmen's Clubs of Massachusetts to send delegates to form a General Convention, Association, or Council; the basis of representation to be one delegate at large for each Club, and one additional delegate for every fifty members or fraction thereof.

H. W. Fuller, Esq., spoke of the success which has attended the efforts of officers of the association in securing proper legislation in the interest of the public and the protection of food fishes. The annual meeting takes place April 6th.

CONNECTICUT.—Our correspondent from Hartford (T. S. S.), writes: "The lower branch of the Connecticut Legislature has seen fit to pass a bill, forbidding the shooting of quail in this State for the next three years, which seems a great injustice to the lover of field sports. If we could feel, in the depths of our heart, that the concoctors of this bill were *intelligently acquainted* with the habits of this game, and that the movement arose from a *benevolent inspiration* to preserve the bird, we would feel resigned; but the contrary is the case. How often does the boot of the sportsman come in contact with (very naturally, too,) the traps, set by the *farming legislators* and their boys, who give the game no chance, but capture them by the wholesale.

These farmer's devices kill more game than a true sportsman twice over, and until the former are ready to relinquish their traps, the latter will respect but little their wishes. We are happy to report, that the Senate has not as yet concurred in the views of the House."

CALIFORNIA.—The Nimrod Sporting Club, composed chiefly of the senior students of St. Ignatius College, has just been organized at San Francisco, Cal., with a membership of 150. The officers are: President, Henry I. Fisher; First Vice-President, Peter F. Dunne; Second Vice-President, Jas. D. Phelan; Third Vice-President, W. F. Stafford; Corresponding Secretary, Francis J. Cleary; Recording Secretary, Albert M. Whittle; Treasurer, Richard P. Doolan; Sergeant-at-Arms, J. P. Amos.

—Thirty-two States of the Union have adopted the laws and policy of the parent Society of New York for the Prevention of Cruelty to Animals. Florida, Mississippi, Arkansas, and Nevada, are the only States which, thus far, have failed to enact laws for the protection of inferior animals.

POT-HUNTING.

NEW YORK, March 19, 1877.

EDITOR FOREST AND STREAM.

Your correspondent, Pot-Hunter, sounds his own condemnation. He is the foe of all true sportsmen, and his name is Legion. During the past winter every gun has been brought to bear upon the defenceless birds without mercy, or any thought of the future supply. For the last ten years I have witnessed the rapid decrease of game with feelings of disgust. In many places where I used to get good shooting, game is almost annihilated. The game laws only protect during the close season; they do not prevent its ruthless slaughter at other times. Pot-hunters, economical of their powder, shoot on the ground, whenever they get the chance. The result of this is obvious. The tax on guns, as suggested by "Medicus," would be of infinite service, and since the duty on a box of matches is not regarded as an infringment of the liberty of the subject, it should not be so construed. A tax of say $15 annually would be willingly paid by sportsmen for the satisfaction of knowing that so many guns in the country would be suppressed. I will direct the attention of Sporting Clubs to the German chasse system. The Government Reservation of the Yellowstone Park will form a precedent. If some very stringent measures are not at once adopted, there will soon be no sport worth having. VENATOR.

OBITUARY.—Died, at Hantsport, Nova Scotia, on the 21st of February, after a protracted illness of two years, Capt. N. W. Beckwith, well-known to readers of magazines, and periodicals, as the author of interesting sea-faring sketches, many of them written for young people. A very strong vein of humor tinged his really clever crotcheries, which were not exaggerated "sailor's yarns," but bits of actual experience, gathered from an eventful life in all parts of the globe, with a good deal of information contained in them relating to natural history, geography, etc., for the Captain was a close and intelligent observer. He has written many sketches for FOREST AND STREAM, one or two of which remain unprinted. His two orphan children have lost a kind father, his acquaintances a genial companion and honest friend, and the public a writer, whose works had more than ordinary value. His daughter, in a private letter to us, says:

"His mind remained clear up to the hour of his death. Only two days before he died he wished me to read to him from *Scott*, his favorite poet. It seemed to have a soothing effect on him to have me read. "It is as good as a grain of morphine," he would say. I read "Harold, the Dauntless." He followed me all through it, once correcting my pronunciation, and often, anticipating a stanza, would quote from memory. He watched so anxiously all through his illness for FOREST AND STREAM. The last one he ever saw came the day before he died. I took it to him. He tried to look at it, but was too weak. "Lay it away, I will read it by and by," he said.

NOT IN THE WILD RICE BUSINESS.—We have received the following card from Mr. Richard Valentine, of Wisconsin, and much regret having imposed so much distress upon our friend. We have referred inquiries to him, under the impression that he once advertised a card in this paper offering Wild Rice for sale. The large number of applications made to him for seed, show that much interest is felt in the subject of wild rice culture, and we have no doubt that the efforts which we set on foot three years ago, will eventually show their fruits in the increased number of wild fowl that will be attracted to our inland waters by the food thus provided for them.

By the way, a great many of our advertisers make the same complaint as Mr. Valentine, that their cards bring them more business than they can attend to. We have heard only one advertiser say this paper was a poor medium, and he offered for sale a second-hand "Elephant gun," that had been used in India! No elephants in this hemisphere, "you know, you know."

JANESVILLE, Wis., March 19th, 1877.

Will you please state in your columns, that I am not in the wild rice business. I can well believe that FOREST AND STREAM is a good advertising medium, if the wild rice letters I am receiving is any criterion. If my correspondents will address S. P. Byers & Son, Princeton, Minnesota, they will be able to get what they want. I have never had any seed to sell, but only acted as a medium in the matter, as a labor of love for my brother sportsmen, as it were.

P. S.—Those who have written me will accept this as reply.

RICHARD VALENTINE.

TESTIMONY OF A BOAT-BUILDER.—J. H. Rushton, of Canton, N. Y., who advertises Adirondack and other boats in this paper, writes to us, March 23d, saying: "FOREST AND STREAM brings me a great many inquiries, and I presume a reasonable number of sales."

Another correspondent in Shakopee, Minnesota, says:—"I thought a little while ago that I should have to forego the further pleasure of reading the FOREST AND STREAM in order to shorten expenses, so as to be prepared for a terrible struggle with the grasshoppers this season, but my two boy's say, that they will rather shorten up on anything else I may designate, than to miss the FOREST AND STREAM from our table. As for myself, I solemnly believe, that if your paper found a larger circulation among that class of men, our youths, who now waste their means on such stuff 'that goeth into their mouth and stealeth away their brains,' a very large number of them would become better men and thereby not only improve their morals but also their health."

Sporting Notes From Abroad.

(FROM OUR OWN CORRESPONDENT.)

LONDON, March 12th.

BY far the most interesting event which has occurred in the sporting world since I last penned you a letter was the great coursing event of the year, the Waterloo meeting at Altcar, near Liverpool. To win the Waterloo Cup is, among coursers, an achievement of equal merit with winning a Derby among turfmen, and the speculation upon the first-named event is probably equalled in no other contest in which horses are not the chief actors. In fact, the element of chance enters largely into it, for not only is it accompanied by all those casualities, such as lameness, over-training, etc., etc., that are peculiar to racing, but the dogs are drawn by lot to compete against each other, and it might largely influence the prospects, even if a "first favorite," whether he was drawn in the first round with a dog whose pretensions nearly equalled his own, or with one who was greatly his inferior. There is no "laying up for a heat" in coursing, and a severe course in the first ties has knocked into a cocked hat, so to speak, the chances of many a heavily-backed greyhound. Coomassie, the winner, who was bought almost at the last moment to fill a nomination, is one of the smallest greyhounds that ever won this important event, weighing only forty-two pounds, but a perfect picture of symmetry. Braw Lass, the "runner-up," as the losing dog in the final heat is termed, is almost as small weighing but four pounds more than the winner. The closing course is thus described in one of the sporting papers:

"Coomassie's last course was also brilliantly run. Although on a strong outside at last, she went up two lengths first, and scored twice after shooting smartly from the turn before losing her place in attempting the death. Braw Lass then made a good effort, and a loud Lancashire shout instantly rent the air; but Coomassie, not to be denied, drew in front immediately she got the slightest opening, and the last two points and a good kill landed her a decisive winner. The Waterloo Cup was never run through more meritoriously, not even by Master McGrath."

While I am on dogs I might mention that a Fox Terrier Club has been formed, and a bench show, exclusively of these game little dogs, will be held at Lillie Bridge early in May. It is astonishing the rage which exists here for these dogs. The prices paid for notorious animals and for the stud services of celebrated prize-winners, equal, if they do not exceed the same amounts spent on setters or pointers, and possibly on greyhounds. They are, undoubtedly, however, charming pets, not altogether useless, and possessing all the game attributes of the bull dog or bull terrier, with the affectionate disposition of most breeds of sporting dogs. I prophesy that when once fairly introduced into the United States they will become great favorites. For starting foxes in your wild rocky country, or for keeping down woodchucks and badgers, they would be invaluable.

We hear but little more regarding the great walking match between O'Leary and Weston, although the money, or a large portion of it, is posted. The Chicago man was fairly defeated last week at Manchester, in a match with Peter Crossland, of Sheffield. The match was for a stake of £200, to be awarded to the man who should walk the greatest number of miles in three days. Although O'Leary lost, his walking was remarkable, from the fact, that the time was the fastest on record for any mile after the 138th. A report says: "The start took place at 9 P. M. on Wednesday evening, when O'Leary pursued his usual tactics by at once going away with a strong lead, which he maintained into the 70th mile. Hence Crossland led the van into the 134th mile, whence the tables were turned up to the 241st mile. From this point the Englishman slowly but surely wore his opponent out, till at the completion of a little over 267¾ miles O'Leary was dead beat, and compelled to retire. Crossland kept going until he had walked 287 miles at 6.22.22 P. M., Saturday evening, in 69h. 22m. 22sec., when he was declared the victor." O'Leary was twenty-seven miles behind at the finish, and it is said, he was driven delerious by his exertions on the early part of Saturday morning, as he was absent from the track five hours on the afternoon of that day.

It is *said*, that Stanton, the great bicyclist, rode 100 miles the other day at Agricultural Hall, in less than six hours and a half. His opponents were six trotting horses (?), whom he tackled in "One down 'to'ther come on" style, and, of course, defeated them. On the next day, it is claimed, that he rode fifty miles in 2h. 56m. 42½sec; but the authenticity of both performances appears to be doubted. There is no question, however, but that he is a wonderful man at his peculiar vocation. Probably, before this letter reaches you, the cable will have conveyed the result of the Oxford and Cambridge boat race. With the conclusion in your hands, it would be folly for me to occupy your space with training reports. Suffice it to say that, at the moment, Oxford is a strong favorite, although there are are not wanting many old and keen oarsmen who pin their faith and put their pounds on Cambridge. Taking the mean of all I read and hear, I judge the race will be an unusually close one, with Oxford, barring accident, the winner.

It may please those Americans, who, while in London, make the Langham Hotel their headquarters, to know that as a result of their gregarious inclinations and spendthrift habits, they have contributed to swell the incomes of bloated British boudholders. The hotel company is a stock corporation, and the last dividend was twenty per cent. At a meeting of the shareholders recently, the chairman stated that the secret of success was in being a first-class hotel, and that the consumation of wine must not be less than 15,000 bottles in every three months. That would be a bottle of wine a day for 170 guests. What a quantity of logwood and marsala the American traveler must have consumed. If the holders of Confederate bonds, or even Erie Railway stock, would establish first-class hotels for Americans, they might soon be avenged, and the question of misplaced confidence transferred.

There is a question upon which I have commented before in these letters, and regarding which I find myself constantly speculating; that is, the good grace with which the British agriculturist sacrifices himself, his lands, and his crops thereon, in the interest of "sport;" and that, too, a sport enjoyed only by his superiors in station. There is, now, a story by Mr. Anthony Trollope, being published in Temple Bar, and called the "American Senator," in which the said Senator gives expression to his sentiments regarding fox-hunting, in which, if I cannot agree with him regarding the pleasures of the chase, I can, most heartily, sympathize with him in his astonishment at the manner in which the farmers of this country submit to have their lands ridden over, and their farms and crops destroyed. To be sure, every hunt has its "fund," from which the damage inflicted is supposed to be made good; but it is impossible that a tithe of that inflicted can ever be paid for. It must be a remnant of the old feudal system when the king and his courtiers did pretty much as they pleased with everybody and everything. Fancy a New Jersey or Pennsylvania farmer submitting to having his fences thrown down, and his locks smashed! The old "Queens Anne" would be brought out, and a foot-race or a funeral would follow to a certainty. Strange to say, according to the statutes, fox-hunters have a right to cross a man's demesne, "while in fresh pursuit," the fox, in common law, being looked upon as a beast of prey, notwithstanding that they are preserved as carefully as pheasants. Speaking of fox-hunting, the following verses by the late Charles Kingsley have just appeared in Macmillan's Magazine:

You sound's neither sheep bell nor bark:
They're running, they're running, Go Hark!
The sport may be lost by a moment's delay,
So whip up the puppies and scurry away.
Dash down through the cover by dingle and dell,
There's a gate at the bottom, I know it full well;
And they're running, they're running, Go Hark!

They're running, they're running, Go Hark!
One fence and we're out at the park.

Sit down in your saddles, and race at the brook,
Then smash at the bullinch; no time for a look.
Leave cravens and skirters to dangle behind,
He's away for the moors, in the teeth of the wind,
And they're running, they're running, Go Hark!

They're running, they're running, Go Hark!
Let them run on and run on till it's dark!
Well with them we are, and well with them we'll be
While there's wind in our horses and daylight to see:
Then shog along homeward, chat over the fight,
And bear in our dreams the sweet music all night,
Of—they're running, they're running, Go Hark!

VAQUERO.

Rifle.

RIFLE NOTES.

—It is said that Major Herbert S. Jewell, I. R. P. Fifth Brigade, and one of the reserves in the American Team in the International matches at Creedmoor last year, has arranged a rifle match between six Brooklyn marksmen and the same number of New Yorkers. The team which will represent Brooklyn will probably include General Dakin, Major Jewell, R. Rathbone, Isaac L. Allen, L. Weber, and Charles E. Blydenburgh. The match will be shot at Creedmoor in May at the three longest ranges.

They appear to have some good rifle shots in Texas. We learn from an exchange that at Houston, recently, President Porter and Chief of Police Erickson shot a match at 800 yards for the purpose of testing the merits of rival rifles, with the following result; A. Erickson, with Sharp Creedmoor—5 5 5 4 5—24. Mr. Geo L. Porter, Remington Creedmoor—3 5 5 3 3—18. "Mr. Erickson also fired a large number of shots, making a percentage of 899. As the percentage made by the winning team in the great entertainment match last year was but 870, it looks as though Houston might be represented by at least one rifleman in the next international match."

The French National Rifle Association, founded in a modest way in 1875, has now become an important institution. The report on the operations of the year 1876 exhibits a continuous and regular success. On the 31st of December last there were existing in the departments 1,511 local societies, and 2,138 competitions had been organized; 4,375 diplomas had been conferred to the best shots, and 10,392 medals had been awarded. The total number of prizes distributed was 14,925. The Association issued to its 160,359 adherents 313,800 scoring papers, and the number of cartridges used was 3,207,180.

The first German Hunting Club of New York City held a meeting and election at their headquarters, No. 384 Pearl Street, on the evening of March 14th, when the following officers were elected: T. Kuntz, President; P. Hammer, Vice-President; H. Berlau, Secretary; Wm. Schwindt, Treasurer.

HELLWIG'S GALLERY.—A cash prize shooting match will come off at Hellwig's Shooting Gallery, 695 Sixth Avenue, on Saturday, March 24th. The match will be shot at 100 feet distance, 10 shots off-hand, at ready measurement target.

THE FLOBERT RIFLE.—A correspondent writes from Philadelphia, on March 21st, 1877, as follows: "Gentlemen: Some time since I saw a reply to an inquiry in FOREST AND STREAM in regard to using the regular .22 cartridge in a Flobert rifle. The .22 cartridge is too strong to use in the Flobert, as they almost invariably blow out back, and thus endanger the shooter's eyes. When I have occasion to use a stronger charge than the regular breech cap, I take a short .22 cartridge, and after removing the ball with a pair of plyors, empty about half of the powder out and press a T. T. shot on the shell until it is firmly fastened. When using these cartridges, swab out the barrel frequently with an oiled rag. KEYSTONE."

[The old Flobert, of course, would not take the .22 cartridge, but the new rifle has a recoil check which we presume would resist the recoil.—ED.]

POSITIONS.

As shooting at the long ranges has improved during the last few years, so have the styles of holding and steadying the rifle changed. The rifleman's body gradually getting closer, and closer to mother earth, from the upright to the sitting and kneeling, till finally the prone position is universally used for all distances beyond four hundred yards, in this country, while at Wimbledon it is allowable at all ranges. At the present time there does not appear to be any "loop-holes" for further alteration, and the inventive marksman will be obliged to "work" on other parts of this popular pastime, as this important rudiment is mastered. The person who cannot get suited with some one of the positions now in use, should give up the idea of becoming a long-range marksman. It is almost an impossibility to invent any more new positions than those which have been brought out, and to shoot in an unsatisfactory one is as bad as using a weapon which is not reliable. There have been numerous arguments against lying down to shoot, all tending to prove that it was not practical, and that all shooting should be done "off hand." The originators of these ideas, as a general thing, are those who have never shot at long ranges, and who do not know the impractability of making even fair scores with a rifle, off hand, at one thousand yards from the target. The complainers or fault-finders do not know, perhaps, that to move either of the sights the one-hundredth part of an inch would make a difference of from two to three feet at the above mentioned distance.

In the young days of shooting with rifle, there was but little need of using any other than the "off hand" position, unless it was because the weapon was too heavy, for to "throw lead" a few rods was all that was expected of any gun. At the beginning of this century, how a man would be laughed at if seen with his "Queen Ann" using some of the present much thought of positions, but *where* was perfection in shooting at that time? About twenty-five years ago, the kneeling and the sitting styles were thought to be superior to all others, and now they are only used once in a while at three hundred yards. The "lying down" position (feet from the target) gradually superceded them, and was admitted to be the best till within the last few years, when the superiority of the "Farquharson" principle, named after the gentle man who invented it at Wimbledon, was shown by Major Fulton through his famous shooting when on the American Team in the first International match at Creedmoor, in 1874. As far as can be traced, H. Tolley, a veteran shot of Wimbledon, and Andrew P. Fowle, an old and tried rifleman, were the first to shoot at long range, with their feet toward the target at Creedmoor. Fulton, seeing the advantages of lying on the back over shooting with the "head to the target," it is claimed, became Tolley's pupil, and after studying and practising with the Farquharson principle, successfully introduced it. Milner, of the Irish Team, also shot in the first International match lying on his back; but the position appeared to be, and was, very awkward, and did not find favor among the shooting public. G. W. Yale introduced his style, and from it and Fulton's at least twenty varieties have originated. The principal ones have almost all been illustrated and described so often, that it would be useless to do so again, but there are several which are comparatively new, all having good points. There is one, the principal of which has been used by W. Burnham on the Dearborn range of Chicago, A. H. Jocelyn, of the Yonker's Rifle Association, and several others. They are all highly pleased with it, and recommend the position as being comfortable, steady, and convenient. The following is a description of this body-rest:

Take your rifle in your left hand, and (you are supposed to be lying on your back) turn *entirely* on the right side; while doing so, thrust the left leg out straight, so that it is as near being at a right angle with the body as possible, without feeling strained. Now bring the right leg (bent) under the left one, so as to brace and steady it, or, in other words, "lock" the legs together. When this is done, rest the rifle's barrel in the small hollow which is in the leg just above the knee-cap. When this is done, double-up the right arm (as in the cut) and grasp the upper part of the heel plate with the hand. When the rifle is firm, lay the head on the stock so as to see the sights. (It is well to use a small pad to put between the head and wood.) After this has been done, put the left arm around so as to grasp the stock, and pull the trigger with the little finger. The right eye is used for the short and the left for the long ranges. If all this is done correctly, the position will be found to be a comfortable one, although it may appear to be a little awkward in the cut. Try it well, before you judge harshly! It may not suit some people, as is the case with all of the other styles, for what will fit one rifleman's build, may be worthless to another. This is the reason for such a variety of positions, all excellent ones, generally. The advantages or good points of the above-described "side" position are claimed to be as follows: First, the body is in a natural and easy position; second, the rifle can be held very steadily; third, the left arm can be made to serve as a shade for the eyes; fourth, the right hand has entire control over the spirit-level; fifth, the three-pound pull on the trigger seems to feel much easier when the little finger is used. In relation to the bad points—well, perhaps, some other rifleman will write of them, if there are any to write about. No pistol grip is needed, unless inverted and put on the upper part of the stock, as it has been done in a few cases.

The long-range riflemen have the front, back, side, and combination between the back and side, positions to choose from to bring into use, and now there is no other way or manner that man can shoot, except perhaps, to rest on his head, which would certainly be on the climax of the knots and grape-vine twists. ONICKO.

NEW YORK.—The Helvetia Park, formerly called the Meckert Park, Guttenburg, N. J., was the scene of a very spirited shooting match between the Zettler Rifle Association, and the Columbia Rifle Association, last Saturday, March 24th. It appears the Columbia men had the idea, that shooting in a gallery was not "worth a cent" for out-door practice. After having boasted of this fact, they were pluckily taken up by the "in-door" shots (the Zettler Rifle Association), who challenged them to shoot, with ten men on each side, ten shots apiece, Swiss rifles, hair triggers, 200 yards distance, at ¾-inch ring targets (the centre to count 25). To the astonishment of the Columbia Team (this Association had been, till last year, the "Champion" for several seasons in Swiss shooting in the United States), the Zettler Rifle Team was victorious by 148 points. Smarting under this "walk over," the defeated ones challenged the victors to shoot under the same conditions, with a team of fifteen men on each side. The last match was the result of this challenge, and the following scores will show the continued success of Zettler's Rifle Association:

ZETTLER RIFLE TEAM.		COLUMBIA RIFLE TEAM.	
Name	Total.	Name.	Total.
W. B. Engel	226	J. Hintz	204
D. Miller	200	J. Aschbeck	191
C Jadson	196	J. Fiedner	193
P. Fenning	193	A. Krnisch	188
M. L. Riggs	191	G. Blumenberg	186
C. G. Zettler	185	G. A. Reindahl	177
T. Kleierath	185	J. Schaefin	174
J. Dutil	176	J. Bantel	173
Wm. Klein	174	C. Horney	170
L. Bird	170	B. Lippmann	168
F. Fabarius	157	C. Holets	164
D. L. Beckwith	157	C. H. Gruber	162
B. Zettler	155	J. Reis	142
B. S. Brown	147	F. Landaldt	135
G. W. Schurman	143	B. Volckens	119
Total	2,555	Total	2,544

Zettler's Rifle Association winning by 101 points.

THE NEXT INTERNATIONAL MATCH.—The Dublin correspondent of the *Times* writes as follows: "The letter of Capt. McDonald, of the Scotch Team, has excited a good deal of adverse criticism here. That there is an objection to the journey to America is true, but the proposal to fight the battle on some neutral ground is held to be impracticable. If there is to be an annual match, or match at all, it must be fought at either side the Atlantic—this is rather clear. Why, then, talk about a journey which is inevitable? A triennial contest, too, is a suggestion calculated to kill the whole thing. Major Leach is at work endeavoring to force the tide in—as easy a job as to keep it out. You are aware that we have NO volunteers in Ireland. The Major has begun an agitation to include Ireland in the scheme, and has secured the partia-

mentary services and sympathy of Mr. O'Clery, the member for Wexford. If there were volunteers, there would be a thousand riflemen in Ireland, instead of a score, and then there would be a chance of getting that laurel wreath from you which we have thrice failed to win. I confess that just at present nobody seems mindful of rifle shooting. We have been beaten too often."

CONNECTICUT.—A correspondent sends us the following account of a shooting match which took place at Glenville, Connecticut, on Saturday, March 10th, 1877. He says, "The match grew out of a dispute between myself and several gentlemen of Portchester and Glenville, they claiming, no 'rim-fire cartridge' could shoot accurately up to 300 yards. I used a Stevens rifle, 26-inch barrel, with 38-100 extra long rim-fire cartridges, my opponent using a Remington 44-calibre, and centre-fire cartridges. The following is the result:

(1st) TEN SHOTS AT THREE HUNDRED YARDS.

Name.	Score.	Total.
Rim Fire	4 4 4 4 4 4 4 4 3 4	4—39
Centre fire	3 4 4 4 3 3 3 4 5 4	5—37

(2d) FIVE SHOTS AT THREE HUNDRED YARDS.

Name.	Score.	Total.
Rim fire	4 4 4 5	4—21
Centre Fire	3 4 3 4	3—17

"The day was very cold and windy. My rim-fire cartridge is made by the Union Metallic Cartridge Company, Bridgeport, Connecticut. Yours, truly. W. H. B."

MILEY'S GALLERY.—The following are the best targets made last week at this gallery in lying down position:—

Name.	Score.	Total.
W. H. Dougherty	5 5 5 5 4 5 4 5 5 5	5—48
A. S. Swan	5 5 5 5 4 5 4 5 4	4—47
A. H. Anderson	5 5 5 5 4 3 5 4 5 5	5—46
E. B. Castner	5 4 5 3 3 5 5 5 5	5—45
F. P. Pike	5 4 3 5 5 5 5 5 5	3—45

In the Press Match, the *Union* and *Eagle* men are a tie. Mr. Chadwick, of the *Eagle*; Mr. Angell, of the *Union*.

DITTMAR POWDER IN RIFLES.

NELLES CORNERS, March 19, 1877.

EDITOR FOREST AND STREAM.

In your journal of 25th January, 1877, B. M. S., asks if R. M. S. would try Dittmar powder against black Curtis & Harvey's No. 6, at 500 yards, and report result. Yes, here you have it. B. M. S.'10 shots made with Sharps' rifle, 500 yards, muzzle rest, scoring 45 points out of possible 50, using Dittmar powder, equivalent in bulk to 70 grains black powder, and 330 grains bullet. These balls were nearly all in the centre of the bullseye, and all carried well up. Again, 10 shots, same distance, same rifle and shooter, sights same position, scoring 39 points out of the possible 50, and all the balls fell, on the average, six to eight inches lower than when driven by Dittmar powder. This, I think, will convince B. M. S.; if not, let me hear from him.

I was taken by surprise on the 6th inst., by the arrival of Mr. Carl Dittmar in town, he was entertained by the Fisherville Amateur Rifle Club, until Tuesday, 13th inst., when he left for the East again. During his stay amoug us, we tried his powder in all manner of ways, both with rifle and shot gun, and I have no hesitation in pronouncing it the best sporting powder made, and he certainly deserves credit from the sporting fraternity at large, for] producing such a desirable article.

R. M. S.

Game Bag and Gun.

GAME IN SEASON IN APRIL.

Wild duck, geese, brant, &c.

—There are a large number of red-heads and sprig-tail ducks in the upper Potomac now.

HORSE HEAVEN.—Is it a place of equine glory, or what? It is a place on the edge of Norfolk, Virginia, where the snipe most do congregate. A place where in days of yore the turkey buzzards regaled themselves on the bodies of the poor equines that were brought from the city. In March and early April the snipe, attracted by the good cover, swampy land, and good feed, are there in goodly numbers. One needs, to go there to make a good bag, a quick eye, a cool head, and a big pair of rubber boots. A number of good bags have been made there the past week.

NICHOLS AND LEFEVER.—We have received the illustrated catalogue of this eminent firm of gun manufacturers, whose works are located at Syracuse in this State. The guns made by Messrs. Nichols & Lefever have stood the test of years of trial, and are considered second to none, many of the leading pigeon shoot rs in the State using them. In addition to their regular line of breech-loaders, Messrs, Nichols and Lefever make a sub-calibre rifle, weighing but 1½ and 2 pounds, which fits into the barrels of the shot-gun, converting it into a rifle at the shortest notice.

GREEN'S LOADER.—A correspondent, writing from Croton Landing, N. Y., makes the following suggestion regarding an improvement applied to this handy invention: "As a simple improvement to 'Green's pat. Loader' might be appreciated by those who read your paper, and load shells for themselves, I suggest the application of a spiral spring to throw up the plunger, instead of lifting the usual way.

Any one can make the spring by simply winding small sized wire around a rod, the size of the plunger, eighteen times, about ⅞ of an inch apart, said spring passed over the barrel and the plunger pass through it by removing the slot screw. Finding this so convenient and expeditious, I quote the words of a friend"—"It's fun to do it." C. M. T.

MASSACHUSETTS, *Salem*, March 26.—The past week has been so varied in weather, that but few spring birds are yet seen. Was over to Nahant lately; saw say 500 black ducks laying in beds on the water, Lynn Harbor. They did look provoking. Woodcocks are not yet along. Sea-fowl are still numerous along our shores. More when I get it from "Seal."

NEW JERSEY—*Cape May, April 24th.*—The shooting of brant on the Jersey coast will continue until about May 1st, at which time they have generally all departed for their northern breeding places. These fowls appear on this portion of the Atlantic sea-board during October and November, and March and April. They are generally shy, and it requires all the wiles of the experienced sportsman to obtain successful shooting.

PENNSYLVANIA.—The monthly shooting match of the Mt. Airy Shooting Club came off the afternoon of the 21st inst., at the farm of Mr. Morris Borsting. The score was as follows: No. 1. Mr. Albert Reynor, killed 5 birds; No. 2. S. T. Goofrey, 4; No. 3. Elick Key, 4; No. 4. W. Mackey, 7; No. 5. W. L. Smith, 6; No. 6. Mr. Clint Rover, 8 birds, and was champion of the day, and to whom the club's medal was handed over, by the late champion, Mr. S. T. Goofrey. Number of birds shot at, 10.

VIRGINIA—*Blacksburg, March 23d.*—First snipe of the season arrived yesterday, I saw six and bagged them all. Last year they were here on the 10th of March. Grass buds, &c., correspondingly backward as compared with last year. E.

SOUTH CAROLINA, *Port Royal*, of March 23, 1877.—To-day gives promise of settled warm weather, but up to now the contests between old "Boreas," and his Southern rival, "*Wamdus Notus*" have been frequent and furious. Gale has succeeded gale with unswerving monotony, bringing the most abrupt transitions from heat to cold, and *vice versa*. The past will easily pass upon record as "the windy winter." An enormous quantity of rain has also fallen (another distinguishing feature), coming at regular intervals of three or four days all through February and March. With a warm week, vegetation will be as forward as usual by the first of April. I judge from reports that the effects of the cold winter have been much less severe in this section than in Florida.

There are always some wonted birds in this vicinity at all times of the winter, but the masses winter in Florida and along the Gulf. None have yet arrived from those parts. R

NEW YORK.—A contest for the custody of the gold medal of the Onondaga County Sportsman's Club, between Messrs. George Lodder, holder, and Andrew Hudson, challenger, took place on the Clark farm in Brighton last week, and resulted in Mr. Lodder's successful defense of the medal, as will be seen by the following score:

TWENTY-ONE YARDS.

Name.	Score.	Total.
Lodder	1 1 1 1 1 1 0 0 1 1 1 1 1 0	12
Hudson	1 1 1 1 0 1 1 1 1 0 1 1 1 1 0	12

TWENTY-SIX YARDS

Lodder	1 1 0 1 1	4
Hudson	0 1 1 1 0	3

At a meeting held on Tuesday evening, March 20th, 1877, at the house of Henry Kenebel, 616 DeKalb Avenue, Brooklyn, a pigeon club was organized, to be called the United Pigeon Club of Brooklyn. The following officers were elected: Martin Helmsteadt, President; William Tomford, Treasurer; Henry Knebel, Secretary.

The Kennel.

THE NEW YORK BENCH SHOW.

OUR excellent contemporary, the *Turf, Field, and Farm*, in a very pleasant notice of the approaching Bench Show in this city, criticises the rules, and claims that Rule 1 and Rule 6 are in conflict, from the first requiring the name of sire and dam to accompany the entry of the dog, and the last stating that "the pedigree of all dogs are desired, although not actually required," etc. Now, if our contemporary will look at the rules again, he will see that Rule 1 reads as follows: "Every person who wishes to exhibit at any show held under these rules, must, at the time of entry, clearly identify by name and age (*if known*) the dog he intends to exhibit, and the name of sire and dam (*if known*) must be given." *Ergo*, if the names of sire and dam are unknown they need not be given. The necessity of this rule is apparent. It insures, or is intended to insure, the identification of a dog, and to prevent a previous prize winner, now a champion, being placed in the open classes; a precaution such as would be taken at a trotting meeting to prevent a '30 horse from being fraudulently entered in the '40 class. Rule 6 is also a good one, for it is reasonable to suppose that of two dogs one with and the other without a pedigree, but equal in Bench Show, points, the one tracing directly to some well-known strain of good field dogs, is likely to be the best of the two. We think, however, that it should have been stated in the Premium List, that Rules 1 and 6 applied to the sporting classes only.

There is another point to which it may be as well to allude: that is, the difference in the value of the prizes offered in some classes, the sporting in particular, and those in others. Managers of a Bench Show, in making up a Premium List, have to be governed by the amount of patronage expected, and it would be manifestly unfair to offer the same amount in premiums for a class, which might not furnish half-a-dozen competitors, as would be given for one where there is almost certain to be a hundred. And, again, looking at it broadly, we presume, that in the present stage, Bench Shows in this country, while their object is to improve all breeds of dogs, have more particularly in view the development of the sporting classes.

NEW YORK, March 26, 1877.

EDITOR FOREST AND STREAM:

Not being able to incorporate the Special Prizes in the regular lists, I send you a list of some that have already been donated and classified, but many more are expected to follow. Applications have already been received from all parts of the country for entry forms, and the prospects are that this will be the grandest show ever held.

SPECIAL PRIZES.

$50 in gold coin for the best native dog and bitch ($25 each), black and tan, or black tan and white, cross bred, with Irish or native English strain.

$150 silver cup, presented by Messrs. Tiffany & Co., for the best dog or bitch, pointer or setter; entered in the open class.

$50 dly rod, and silver-plated reel, presented by Frederick Schuahardt, Esq., and manufactured by William Mitchell, of New York, for the best brace of pointers (dogs or bitches), of any weight, owned and entered by one person. (The donator will not compete in this class.)

$100 silver cup, manufactured by Tiffany & Co., presented by members of the New York Association for Protection of Game, for the best brace of setters, of any breed (dogs or bitches), entered in the open classes, owned and exhibited by one person.

$100 silver cup, presented by FOREST AND STREAM Publishing Company, for the best red Irish setter stock dog, either native or imported, to be shown with not less than two of his get, the latter to be the property of any exhibitor on exhibition.

$100 double-barrelled Fox patent shotgun, presented by the American Arms Co., for the best red Irish setter, brood bitch, either native or imported, to be shown with not less than two of her puppies.

$75 silver cup, made by Messrs. Tiffany & Co., and presented by Dudley Olcott, Esq., of Albany, N. Y., for the best English setter, native bred, out of native bitch, by an imported dog.

$100 gun, presented by H. C. Squires, Esq., for the best English setter, stock dog, either native or imported, to be shown with not less than two of her get.

$25 English sole leather gun-case, with cartridge top, presented by Erdman A. Herzberg, Esq., of New York, for the best cocker spaniel, dog or bitch.

In addition to the above prizes, many more have been donated, but not yet classified, but at the next meeting of the Committtee they will be arranged and a full list printed. It is the intention of the Committee to gives prizes to stock, dogs and brood bitches, in all the sporting classes.

Yours truly,
CHAS. LINCOLN, Supt.
Box 2832, New York.

SETTERS—ENGLISH, SCOTCH, AND IRISH.

BY "STONEHENGE."

IN the issue of the London *Field* of March 3d, is an extended article by the well-known authority and editor of the *Field*, "Stonehenge," on setters. So much of the blood of the various celebrated strains of which he writes, and, in many instances, the animals themselves, have been imported into this country, that the subject cannot fail of possessing great interest to American breeders. Being too long for us to publish at one time, we have divided it into three parts, giving this week that portion referring to the English setter:

THE ENGLISH SETTER.

Since the first publication of the articles on the various breeds of dogs, in *Field*, during the year 1865-6, the strain of English setters known by the name of "Laverack," from the gentleman who bred them, has carried all before it, both on the show bench and in the public field trials, which have been annually held. For this high character, it is greatly indebted to the celebrated Countess, who was certainly an extraordinary animal, both in appearance and at work; for, until she came out, the only Laverack which had shown to advantage was Mr. Garth's Daisy, a good average bitch. Though small, Countess was possessed of extraordinary pace, not perhaps quite equal to that of the still more celebrated pointer, Drake, but approaching so closely to it that his superiority would be disputed by many of her admirers. On referring to her portrait, it will be seen that her frame, though on short legs, is full of elegance; and her beautiful head and neck are absolutely perfect. With her high pace she combined great power of endurance, and her chief fault was, that she never could be fully depended on; for, when fresh enough to display her speed and style to the full, she would break away from her master, and defy his whistle until she had taken her ding over a thousand acres or so. On a good scenting day it was a high treat to see her at work; but, like most other fast gallopers, she would sometimes flush her game on a bad scenting day, and then she would be wild with shame. An instance of this occurred at the Bala field trials of 1872, when, on her appearance in the stake for braces, with her sister Nelly, both of these bitches were utterly beyond the control of Mr. Buckell, who worked them, Nellie even chasing a bird like a raw puppy. To get rid of this wildness, they were worked hard in the day which intervened between their appearance in the braces and Countess' trial in the Rhiwlas Stakes, when she came out as stale as a poster, and was only placed third to Ranger and Belle. Still, though manifestly beaten, she evidently was so from bad judgment alone on the part of those who managed her, and she only injured the character of the breed to which she belongs so far as to show that, like most high-couraged setters, they require a certain amount of work to keep them steady, which, it appears, she had not done. Nellie (the sister) was of the same size, but not so fast nor so elegant; still, she was good enough to beat the crack on one occasion, at Vaynol, in 1872; but on most days she would have stood no chance against Countess. She served to show that Countess was not wholly exceptional, as was sometimes alleged by the detractors of the Laverack; and these two bitches, together with Mr. Garth's Daisy, may fairly be adduced as indicating that, at all events, the Laverack bitches are quite first-class. No dog, however of the pure breed has yet put in an appearance at any field trial with any pretension to high form, but several winners have appeared half or quarter-bred, of that strain. For example, Mr. Statter's Bruce, by Dash (Laverack) out of owner's Rhœbe, and his Rob Roy, by Fred II. (also Laverack) out of the same bitch, may be adduced; but Dick and Dan, by Duke (of the Corbet and Graham strain) out of Rhœbe, were were far superior to these dogs, and serve to show that, at all events, as crosses for other breeds, the Laveracks are not to be so highly commended as Mr. Lort, and other disciples of the Laverack school, would lead us to believe. The cross which has been most successful is that with Mr. Lort's, Mr. Garth's, and Mr. Paul Hackett's blood, culminating in the third remove from the Laverack kennel in Mr. Macdona's Ranger. This dog was fully as fast as Countess, with a keener nose and far better temperament, being, when in form, as steady and dependable as a steam locomotive. Mr. Macdona's favorite may be classed A 1 among the field trial winners in a quartette including Drake, Countess, and Belle; the Irish setter, Plunket, approaching them very nearly, but not quite reaching their level. Roll, who won several prizes on the show bench, is of the same cross as the grandsire of Ranger, both being out of Lort's Dip, by a Laverack dog, and these last being all the same blood, as I shall presently show, though their sires are respectively named Rock and Fred II. Roll was a grand dog in shape, with the exception of his loin, in which a certain amount of slackness was displayed when a little out of condition, as he generally was when shown, being a shy feeder. I am told by Mr. Lort, who shot over him for some time, that he was as good in the field as on the bench; but when I tried him he had no nose whatever. His pace was very great, with the usual Laverack quiet trail of flag. The portrait of this dog—selected for the second edition of "Dogs of the British Islands"—is valuable, not only as showing the true type of

the setter, but for the excellent foreshortened view of the head which Mr. T. Earl has given to him. The spaniel-like character peculiar to the Laverack dog, is also quite lost in him by the cross with the Anglesea bitch, Dip.

The most remarkable feature in the Laverack breed of setters, is the extraordinary extent to which in-breeding has been carried, as shown in the pedigree of Countess, given by Mr. Laverack in his book on the setter. By examining this carefully, it will be seen that every animal in it is descended from Ponto and Old Moll, which were obtained by Mr. Laverack in 1825 from the Rev. A. Harrison, who lived near Carlisle, and who had kept the breed pure for thirty-five years.

To this in-breeding is, no doubt, to be attributed the fact, that the Laverack setters are very difficult to rear, and that a large proportion of them die of distemper. Whether or no the average working "form" of the breed is a high one is very difficult to decide; but, undoubtedly, Countess and her sister Nellie were grand specimens of the high-bred setter. Nearly all the pure Laverack dogs which have been shown are too spaniel-like in shape to please my eye, the only exceptions I remember being Prince and Rock, and to some extent the well-known Sam, brother to Countess and Nellie; nevertheless, they have not the spaniel carriage of the flag, which is generally trailed like that of the fox, and without any lashing or feathering. Probably it is owing to the excessive in-breeding of the Lavercks injuring their health, that they have not succeeded as well as might be expected as sires; but at all events, from whatever cause, a good deal of disappointment has been felt by breeders on that score. Nevertheless, for work, the breed still maintains the high character gained for it in its purity by Countess, Nellie, and Daisy, and for its crosses by Ranger, Dick, Dan, Prince, Ginx's Baby, Glen, and last, but not least, that excellent little bitch, Mr. Lloyd Price's Queen, by Blue Prince, out of the Rev. S. East's Quaver II., bred by that gentleman from his own old Shropshire blood.

A great many different strains of English setters might be adduced from all parts of the country, but notably from the north of England, with claims superior to those of Mr. Laverack's strain, up to the time of the institution of field trials. Among these were the Graham and Corbet breeds, those of the Earl of Tankerville, Lord Waterpark, Mr. Bishop, Mr. Bayley, Mr. Lort, Mr. Jones (of Oscott), Major Cowan, Mr. Withington, Mr. Paul Hackett, and Mr. Calver, the last two being a good deal crossed with Gordon blood. None of these strains were, however, so generally known beyond the immediate circle of their owners' friends as to have gained a universal reputation; and it was not till the public appearance of Mr. Garth's Daisy, and afterward that of Mr. Purcell Llewellyn's Countess and Nelly, that the Laverack strain attained its present high reputation. Before Daisy came out, Mr. Garth had produced a brace of very bad ones at Stafford in 1867; and it was with considerable prejudice against them that the above celebrated bitches first exhibited their powers, in spite of the high character given of them by Mr. Lort, Mr. Withington, and other well-known sportsmen, who had shot over them for years. It is Mr. Lort's opinion that Mr. Withington possessed better dogs than even Countess; but it must not be forgotten, that private trials are generally more flattering than those before the public.

1. The *skull* (value 10) has a character peculiar to itself, somewhat between that of the pointer and the cocker spaniel, but not so heavy as the former's, and larger than the latter's. It is without the prominence of the occipital bone, so remarkable in the pointer, and is also narrower between the ears.

2. The *nose* (v. 5) should be long and wide, without any fullness under the eyes. There should be in the average dog setter at least four inches from the inner corner of the eye to the end of the nose. Between the pedlit and the root of the nose there should be a slight depression, and all events there should be no fullness—and the eye-brows should rise sharply from it. The nostrils must be wide apart, and large in the openings, and the end should be moist and cool, though many a dog with exceptionally good scenting powers has had a remarkably dry nose, amounting, in some cases, to roughness like that of shagreen. In all setters the end of the nose should be black, or dark liver-colored; but in the very best bred whites, or lemon-and-whites, pink is often met with, and may in them be pardoned. The jaws should be exactly equal in length; a "snipe nose," or "pig jaw," as the receding lower one is called, being greatly against its possessor.

3. *Ears*, *lips*, and *eyes* (v. 4). With regard to ears, they should be shorter than the pointer's, and rounded, but not so much so as those of the spaniel. The "leather" should be thin and soft, carried closely to the cheeks, so as not to show the inside, without the slightest tendency to prick the ear, which should be clothed with silky hair little more than two inches in length. The lips, also, are not so full and pendulous as those of the pointer; but at their angles there should be a slight fullness, not reaching quite to the extent of hanging. The eyes must be full of animation, and of medium size, the best color being a rich brown, and they should be set with their angles straight across.

4. The *neck* (v. 6). has not the full, rounded muscularity of the pointer, being considerably thinner, but still slightly arched, and set into the head without that prominence of the occipital bone, which is so remarkable in that dog. It must not be "throaty," though the skin is loose.

5. The *shoulders* and *chest* (v. 15) should display great liberty in all directions, with sloping, deep shoulder-blades, and well let down. The chest should be deep, rather than wide, though Mr. Laverack insists on the contrary formation, italicising the word *wide* in his remarks at page 22 of his book. Possibly it may be owing to this formation that his dogs have not succeeded at any field trial, as above remarked; for the bitches of his breed, notably Countess and Daisy, which I have seen, were as narrow as any setter-breeder could desire. I am quite satisfied that on this point Mr. Laverack is altogether wrong. I fully agree with him, however, that the "ribs should be well sprung behind the shoulder," and great depth of the back ribs should be especially demanded.

6. *Back*, *quarters*, and *stifles* (v. 15). An arched loin is desirable, but not to the extent of being "roached" or "wheel-backed," a defect which generally tends to a slow, up and-down gallop. Stifles well bent, and set wide apart, to allow the hind-legs to be brought forward with liberty in the gallop.

7. *Legs*, *elbows*, and *hocks* (v. 12). The elbows and toes, which generally go together, should be set straight; and if not, the "pigeon toe" or in-turned leg, is less objectionable than the out-turn, in which the elbow is confined by its close attachment to the ribs. The arm should be muscular, and the bone fully developed, with strong and broad knees, short pasterns, of which the size in point of bone should be as great as possible (a very important point), and slope not exceeding a very slight deviation from the straight line. Many good judges insist upon a perfectly upright pastern, like that of the foxhound; but it must not be forgotten, that the setter has to stop himself suddenly when at full stretch he catches scent, and to do this with an upright and rigid pastern, causes considerable strain on the ligaments, soon ending in "knuckling over," hence a very slight bend is to be preferred. The hind-legs should be muscular, with plenty of bone, clean, strong hocks, and hairy feet.

8. The *feet* (v. 8) should be carefully examined, as upon their capability of standing wear and tear depends the utility of the dog. A great difference of opinion exists as to the comparative merits of the cat and hare foot for standing work. Foxhound masters invariably select that of the cat, and, as they have better opportunities than any other class, of instituting the necessary comparison, their selection may be accepted as final. But, as setters are specially required to stand wet and heather, it is imperatively necessary that there should be a good growth of hair between the toes, and on this account a hare foot, well clothed with hair, as it generally is, must be preferred to a cat foot, naked, as is often the case, except on the upper surface.

9. The *flag* (v. 5) is in appearance very characteristic of the breed, although it sometimes happens that one or two puppies in a well-bred litter exhibit a curl or other malformation, usually considered to be indicative of a stain. It is often compared to a scimitar, but it resembles it only in respect of its narrowness, the amount of curl in the blade of this Turkish weapon being far too great to make it the model of the setter's flag. Again, it has been compared to a comb, but as combs are usually straight, here again the simile fails, as the setter's flag should have a gentle sweep; and the nearest resemblance to any familiar form is to the scythe with a curve reversed. The feather must be composed of straight silky hairs, and beyond the root, the less short hair on the flag, the better—especially toward the point, of which the bone should be fine, and the feather tapering with it.

10. *Symmetry and quality* (v. 5). In character, the setter should display a great amount of "quality," a term which is difficult of explanation, though fully appreciated by all experienced sportsmen. It means a combination of symmetry, as understood by the artist, with the peculiar attributes of the breed under examination, as interpreted by the sportsman. Thus, a setter possessed of such a frame and outline as to charm an artist, would be considered by the sportsman defective in "quality," if he possessed a curly or harsh coat, or if he had a heavy head with pendant blood-hound-like jowl and throaty neck. The general outline is very elegant, and more taking to the eye of the artist than that of the pointer.

11. The *texture and feather* of coat (v. 5) are much regarded among setter breeders, a soft silky hair, without curl, being considered a *sine qua non*. The feather should be considerable, and should fringe the hind as well as the fore legs.

12. The *color of coat* (v. 5) is not much insisted on among English setters, a great variety being admitted. These are now generally classed as follows, in the order given: (1) Black and white ticked, with large splashes, and more or less marked with black, known as "blue Belton;" (2) orange and white freckled, known as "orange Belton;" (3) plain orange, or lemon and white; (4) liver and white; (5) black and white, with slight tan markings; (6) black and white; (7) liver and white; (8) pure white; (9) black; (10) liver; (11) red or yellow.

WORMS v. DOGS.—The Committee on Agriculture gave a hearing yesterday to Joseph Vickers, of Woburn, upon the general question of dogs and hydrophobia. Mr. Vickers says that every dog has a worm under his tongue, and that this worm is liable to irritate the dog to the point of madness. All that is necessary to prevent the possibility of hydrophobia is to take the worm out. This he claims can be done, and all danger avoided. He has been a game-keeper in England, and says that the practice is common there and in Ireland. He did not say, however, how the Legislature was to secure the unworming of all dogs, whether by the creation of a Dog Commission to examine and operate on all pups, or otherwise.

The above is taken from the *Mining Journal*. When Mr. Vickers has taken all the worms out of dog's tongues, perhaps he will turn water-witch, or engage in the manufacture of philosopher's stones. Seriously, Mr. Vickers is in error in only two particulars; first, in the location of the worms; and secondly, in the fact of worms having anything to do with hydrophobia. Worms infest the intestines of almost all dogs, more or less, and can be easily removed by the use of areca nut, santonine, or other vermifuges. They have no more to do with hydrophobia than the fleas which inhabit a dog's coat.

ST. LOUIS KENNEL CLUB.—The St. Louis Kennel Club has had the misfortune to lose, from pneumonia, their fine red Irish setter, Erin. Erin was one of the best field dogs in the country, and the club will find it difficult to replace him. Their Loo II. whelped on Wednesday of last week ten puppies, four dogs and six bitches, by Elcho. The Columbus Kennel Club's black pointer bitch Belle, winner of first prize at Baltimore, has visited Shaford.

DOG STOLEN.—Mr. John A. Nichols, of the well-known gun manufacturing firm of Nichols & Lefever, of Syracuse, has had the misfortune to have stolen from him his fine gordon setter bitch, Lick. Lick is one year old, black and tan, with a white spot on chest, of light-build, well-feathered, and weighs almost forty pounds. Any person meeting with such a dog will please communicate with Mr. Nichols.

—Mr. Everett Smith (whose name, by the by, was erroneously printed Emmett in our last issue), of Portland, Maine, claims the name Cale for a red setter dog out of his Cora II. by Manasseh Smith's Guy. This name is selected in affectionate remembrance of the late Caleb G. Loring, a thorough sportsman, whose genial qualities have been commemorated in these columns. The names of the setters entered in the Kennel Register by him last week are Cora II, Cale, Bruce, Cosette, Rouge, and Ruby.

—The Westminster Kennel Club have had the misfortune to lose their fine black pointer bitch, Dinab, by Pete, out of Phillis. Dinab, who was at the breaking establishment of Mr. Van Schaick, at Pennington, N. J., was apparently recovering, or had recovered from her *second* attack of distemper, when she was found in the morning dead in her kennel.

—Mr. Charles A. Brigg's (of Waterbury, Conn.) orange and white setter bitch, Daisy, has visited Mr. Blakeslee's Dash.

BREEDING DOGS AT PUBERTY.

BELLEFONTE, NOTTOWAY CO., March 24, 1877.

EDITOR FOREST AND STREAM.

What is the cause of gun-shyness in pointers and setters, and the alleged timidity of the progeny of imported stock? Answer. Breeding dogs too young. During the past few years a great advancement for the better has taken place, owing to the importations by breeders of fine stock from England, in order to produce a finer quality and better field dog than the so-called native, which, with some exceptions, has undoubtedly run down. The late importations are, of course, not all champions. Yet, still, their records on the bench and in the field, show that they were considered of the very best forms that England can produce. One of the oldest associates of the *New York Herald*, who has had, perhaps, the widest experience of any man in America, having attended, in person, every race of note in the United States, for the past twenty-five years, and a thorough sportsman, told the writer, a few years ago, that he had not seen, in all his journeys, more than five or six really good-looking dogs, and that the people were breeding a nation of mongrels, without regard to class, distinction, or color. Since then, the furore in the importation of fresh blood has taken place, and now I assert that with possibly a very few exceptions that the present system of breeding will give us a nation of idiots. Most, if not all, of the sons and daughters of imported stock have been bred too young. Breeding puppy-bitches and puppy-dogs at a year, or even eighteen months, is, I assure you, the cause of gun-shyness, nervousness, timidity, and apparent idiotcy. If the purchasers of puppies out of the whelps of imported dogs would make the inquiry: "At what age were the dam and sire of a puppy mated?" and then repeat the question as to, g. sire and g. dam, the truthful answer would be, "Considerably under two years of age." The primary cause, if not the only reason, of gun-shyness in all dogs, in my opinion, is, because the fathers and mothers, one or both, were bred at too young an age.

Nervousness in any dog is the first step to gun-shyness, the next, timidity, the next, idiotcy. When these puppies are bred again, they will, in all probability, throw idiots; if not absolutely without any intelligence, they will, most assuredly, be useless in the field, and elsewhere. Mating dogs at puberty, so as to obtain a fine specimen of the kind, is like marrying girls and boys at thirteen and fifteen years of age, in order to improve the present race of men and women. The cause of this pernicious practice is in not educating oneself as to how to breed, when to breed, and what to mate to; and I am also inclined to believe, that realization of the dollars has much to do with this great crime. Breeding dogs with success is not accomplished in a day, or a year; one must be prepared to throw away time, energy, and money, and what is greater than all, one must possess a love for the task. It is a study of a life-time, and if, after all the pains taken, one is rewarded by breeding three or four really grand animals, you can think yourself very lucky.

The proper age to breed all dogs and bitches, especially those that have sprung from the loins of imported stock, is certainly not before they have attained the age of full two years, and, in a great many instances, not until they have reached the third year.

Of the many letters I have received on this important subject, I think a short extract from one may be noted: "I think that one pregnant cause of the deterioration, or "running off" of dogs in this country has been breeding them at too young ages. The progeny of babies must be weak and scrubby; must lack power, vitality, and the powers of getting strong, bold, vigorous stock. Especially will this apply to the progeny of imported stock. It is not, as a rule, to be supposed that they become accustomed to the severe and sudden climatic changes of our coast, as readily and naturally as the progeny of dogs, acclimated through generations of residence and exposure here. No dogs, those of lately imported blood especially, should be bred under two years old. Before that time they acquire neither growth, form, strength, character, established constitution, nor the power to reproduce their own best characteristics. This is not because they are feebler than our own so-called native dogs, or in anyway their inferiors in vitality or constitutional vigor. It is because they are amenable to the same influences of acclimization that effect all new comers here. The arctic fox, bred in the tropics, must succumb. The young of the leopard, exposed to the cold of Greenland, must die. Where the extremes of difference are not too great, where they are modified by the care and intelligence of the humane ownership, not only may their baneful influences be successfully resisted, but the transported race, after careful raising, may be moulded into forms of greater beauty, and developed into outgrowths of greater use and value than were the original and transplanted type. This will never be attained where the young specimen is called upon to reproduce his like before reaching, in himself, a healthy and acclimated maturity. What, indeed, is his like? It is an undeveloped, inchoate state of transition, uncertain in the present, impotent in the future.

Let, then, the breeders give their young blue bloods a chance to become Americanized, and do not forget that with good care, good training, good food, good work, and—repeat it incessantly—good age, they bid fair to "out-nose," etc., our best—bred, indeed, from only those who have come before—and to be the best, strongest, fleetest, staunchest dogs in the world, and the continuous begetters of their own gallant resemblances from generation unto generation.

Have any of the so-called breeders improved on the original sire or dam? I think not. Perhaps we may see one at the coming New York bench show. JOHN M. TAYLOR.

SPRATT'S BISCUIT.—A correspondent writes as follows, with regard to the cost of feeding a dog on Spratt's biscuit: "In your last number a correspondent asks for information as to the probable cost of feeding a dog on Spratt's patent cakes per month. I think your allowance of 1½ pounds is entirely too much. The cakes in question weigh about 3½ to the pound, and when softened by boiling water they swell considerably. I have used them more or less for the past two years, and rarely give my full-grown dog more than two of the cakes once a day (at night), except when working him, when I feed both meat and cakes, and think any dog will keep in fine condition on two cakes per day, when not working. This, you see, would make the cost about 6 or 7 cents per day, or about $2 per month. I would advise a change of diet at least once a week. 'JACK SPRATT.'"

Sea and River Fishing.

FISH IN SEASON IN APRIL

Speckled Trout, *Salmo fontinalis*. Land-locked Salmon—*Salmo glaveri*. White Perch.—

FLIES FOR APRIL.

BLACK GNAT, OR MIDGE.—No. 13.—Body and feet black, wings subhyaline.

DARK CLARET GNAT.—No. 13.—Body dark claret, feet black, wings subhyaline.

BRIGHT CLARET GNAT.—No. 13.—Body bright claret, mixed with red fox face, feet ginger, wings of one sex hyaline, the other ocherous.

GRAY GNAT.—No. 13.—Body dark fox, mixed with dark claret, feet gray, wings hyaline.

DARK FOX.—Nos. 10 or 11.—Body and feet dark fox, mixed with lemon colored mohair, wings subhyaline, tail three fibres of dark gray hackle.

POOR MAN'S FLY.—Nos. 9 and 10.—Body and feet, hare's ear and yellow mixed, wings slightly mottled gray, tail the mottle of the wood duck.

OLIVE GNAT.—No. 13.—Body dark olive, mixed with bright claret, feet ginger, wings hyaline.

RED FOX.—Nos. 10 and 11.—Body fox cub face, mixed with yellow, feet red (chicken red), wings pale gray or subhyaline, tail mottled feather wood duck.

BRIGHT FOX.—Nos. 10 and 11.—Body and feet brightest part of the fox, mixed with yellow, wings brightest hyaline, tail pale yellow.

BLACK HACKLED FLY.—Nos. 9 and 8.—Body orange, ribbed with gold tinsel, hackle black wings, tail of the American partridge.

GENERAL FLIES.

IBIS.—No. 8.—A hackle fly, ribbed with silver tinsel; body hackle, wings and tail scarlet.

PEACOCK PALMER.—No. 8.—Body peacock herl, hackle black and red mixed.

GRAY PALMER.—No. 8.—Body peacock herl, dark gray hackle.

PROFESSOR.—Nos. 8 and 9.—Body bright yellow, feet golden brown, wings wood duck and mallard, dyed yellow, mixed, tail scarlet ibis.

QUEEN OF THE WATER.—Nos. 8 and 9.—A hackled fly; body orange

ribbed with gold tinsel, hackle chicken red, wings bright mottle of the mallard.

GRIZZLY KING.—Nos. 8 and 9.—A hackly fly; body green, hackle dark gray, tail scarlet ibis, wings mottled feather of the pin-tail.

FISH IN MARKET.—The storms of the past week have interfered sadly with the operations of fishermen, and in consequence we have to report a short supply and prices extremely high. There have been large arrivals of green turtles. On Friday last, Mr. G. Blackford, of Fulton Market, received the first "Kennebec" salmon from Halifax, N. S. Our quotations for the week are as follows:

QUOTATIONS.—Striped bass, 20 to 25 cents per pound; smelts, 20 cents; salmon (frozen), 25 cents; fresh, $1.25; California, 30 cents; shad (southern), 65 cents each, native, do. $1.50; white perch, 15 cents; Spanish mackerel, 50 cents; green turtle, 20 cents; terrapin, $15 per dozen; frostfish, 8 cents per pound; halibut, 18 cents; haddock, 8 cents; codfish, 8 cents; blackfish, 15 cents; herrings, 6 cents; flounders, 10 cents; sea bass, 20 cents; eels, 18 cents; lobsters, 10 cents; sheepshead, 20 cents; turbott, 20 cents; scollops, $2 per gallon; whitefish, 15 cents per pound; pickerel, 15 cents; Canada brook-trout, 25 cents; Long Island trout, $1; Maine trout, 50 cents; pike, 10 cents; ciscoes, 10 cents; hard shell crab, $4.00 per 100; red snappers, 18 cents.

THE EAGLE'S CLAW.—We have received from Chas. L. Coate, the patentee, 330 Fulton Street, Brooklyn, N. Y., a sample in nickel of the famous Eagle Claw, a device for catching fish and game, for which we do not hesitate to express a deferential respect. It is a formidable contrivance, and is bound to catch anything that comes within its clutches. While we cannot endorse it fully as a sportsman's implement, we are free to say, that for trapping vermin, fur-bearing animals, and fish that will not take the hook, it is very efficacious. We should not like to put our foot in it.

—The snow is still deep in the Adirondacks, and the ice is thick. It will probably be a full month before the streams are open for fishing.

FISHING MOVEMENTS.—The number of fishing arrivals reported at this port the past week has been 30, including 1 from Fortune Bay, N. F., 4 from Grand Banks, and 25 from Georges. The receipts of cod and halibut have been about 505,000 pounds of the former, and 280,000 pounds of halibut. The weather has been unfavorable for curing fish, and the movements have been light.—*Cape Ann Advertiser, March 24th.*

VIRGINIA—*Leesburg, March 21st.*—Black bass have made their appearance at the mouth of Goose Creek, on the Potomac. First caught about St Patrick's day; caught with *red worm* by "a man and a brother." Weather since then snowy.

T. W.

Yachting and Boating.

HIGH WATER, FOR THE WEEK.

NEW YORK YACHT CLUB.—A social dinner was given by the members of this club at Delmonico's on Wednesday of last week, the object being to bring the members together, and see how they felt in regard to the coming season. The feature of the entertainment was the magnificent display of plate in the shape of racing trophies which adorned the tables. The so-called Queen's Cup, won by the America in England, and which has been contended for so unsuccessfully in our own waters by various English yachts, occupied the center of one of the tables. Besides this, almost every cup of consequence contended for by yachts of the N. Y. Y. C. squadron for many years past was exhibited. The Committee being desirous to obtain the handsome silver candelabras won by the Dauntless in a race with the Sappho, the *Herald* authorities telegraphed to Mr. Bennet, in Algiers, and received an answer the same day, placing them at the disposal of the club. The dinner was a great success, and judging by the enthusiasm displayed, would indicate that the yachting spirit rules as strongly in the club as heretofore.

NEWBURGH BAY YACHT CLUB.—The programme of this Hudson River Yachting Association for the coming season is thus early announced. The fourth annual regatta is fixed for August 1st. Prizes will be offered to four classes, as follows: First class, open yachts over 26 feet; second class, open yachts over 22, and not exceeding 26 feet; third class, open yachts 22 feet and under; fourth class, cabin yachts, and all others with working sails. Two prizes will be given in the first three classes, and one in the fourth. The first prize in the classes to be a sum of money and a set of colors. Entries to the regatta, free, will close July 31st. In addition to this regatta, the club offers a purse of $250 in gold for a grand sweepstake race, to take place the day following. This race to be open to all open yachts under 35 feet in length; entrance-fee, $100. The entrance-money to be divided according to the number of entries. Race to be sailed according to Brooklyn Yacht Club Rules, over the usual Newburgh Club Course, twenty miles in length. Entries to the sweepstakes race close July 28.

ST. AUGUSTINE YACHT CLUB.—On Saturday, March 16th, a spirited race between the boats of the harbor and those of the Yacht Club took place. Vice-Commodore Stillman, of the New York Yacht Club, and owner of the handsome yacht now lying in the stream, offered a prize of $100 to the winner of the race, while the Yacht Club offered a beautiful silver prize constituting a second prize for the boat coming in second best. The start was made at 3 o'clock in the afternoon, opposite the wharf. The race was watched with interest for nearly an hour, when the winning boats crossed the line amid breathless anxiety of the friends of the two boats—the America and Alexis. The former won the first prize, and the Alexis the second. Both reached the home stake wing in wing.

SINGLE-SCULL MATCH.—Evan Morris, of Pittsburg, Pa., issued a challenge last week to Billy Scharff, to row him a five-mile scull race for $1,000 a side, and the championship of America. The parties met a few days later, and the match was arranged. The course agreed upon is the Monongahela, and the date fixed for June 9th. A portion of the money was put up as a forfeit. The race will create great interest in aquatic circles.

EASTERN YACHT CLUB.—The first annual dinner of the Eastern Yacht Club, held at the Parker House, Boston, Wednesday evening, March 21st, was unique in every particular. About twenty-five members of the club were present, and Gov. Rice and Hon. Geo. B. Loring were the invited guests. Commodore John M. Forbes occupied the head of the table, and, after the meats and wines had been discussed at length, an hour was spent in speech-making and sentiment. A congratulatory message was received from the New York Yacht Club, who were holding their annual dinner in New York city at the same time, and a timely response was returned.

The schooner-yacht Idler, Commodore Samuel J. Colgate, is lying at the foot of Twenty-eighth street, East River, ready to start for her trip to the West Indies. The Commodore intends starting on Thursday morning, going direct to Bermuda, thence to the Bahama Islands, after which he will visit Cuba, returning home from Havana. Commodore Kane, Captain Henry Steers, and a few other yatching friends, will accompany Commodore Colgate, who expects to be gone about six weeks. He takes the regular captain and crew of the Idler, and an experienced man as pilot and navigator.

NEW YORK ROWING CLUB.—The following is a list of the officers of this club elected at the annual meeting in February last: President, George L. Rider; Vice-President, John A. McKim; Captain, Francis L. Leland; Secretary, John P. Kingsford; Treasurer, Richard B. Hartshorne; Lieutenant, Edmond Kelly. Board of Trustees—George L. Rives, John A. McKim, Francis L. Leland, John P. Kingsford, R. B. Hartshorne, P. de Florez, Charles D. Ingersoll, Thomas Maitland, J. Lowrey Hobson. Standing Committees—Committee on Admissions, John P. Kingsford, Chairman, Robert C. Cornell, Joseph Lentilhon, Charles H. Leland, J. Lowrey Hobson. House Committee, Francis L. Leland, Chairman; Clarence Cary, R. B. Hartshorne, P. de Florez, Charles H. Peters. Regatta Committee, Edmond Kelly, Chairman, Francis L. Leland, George L. Rives, John A. McKim, William H. Colhoun. Delegates to Harlem Regatta Association; George L. Rives, August Belmont, Jr. Number of members, 122.

A scullers' match has been arranged between Wm. Scharff, and Geo. Morris, of Pittsburg, Pa., to be rowed on the Upper Monongahela River Course, on June 9th; the stakes to be $2,000. Both men will go into training as soon as the state of the rivers will permit. Betting at present is in favor of Scharff.

THE OXFORD-CAMBRIDGE RACE.—The great aquatic event of the year in British waters, the annual race between eight-oared crews, representing respectively Oxford and Cambridge Universities, was decided, or rather undecided—for it resulted in a dead heat—on Saturday last, over the usual course—on the Thames, between Putney and Mortlake. The odds for some time before the race, had ranged from 3 to 1 to 5 to 4, in favor of the Oxford or "dark blue crew," the latter figures representing the quotations just previous to the start. The odds would have been lauded, too, had it not been for an accident which happened to the row-lock of the Oxford bow-oar, three-fourths of a mile from the finish, when they were leading by a length, reducing the effective strength in the boat to seven men, and enabling the Cantabs to get even, a position which they maintained to the finish, the referee deciding it to be a dead heat.

The word "go" was given at 8h. 27m. 4s., with the Cambridge boat on the sunny side of the river. Oxford took the water-front, both crews working smoothly, and with Oxford leading a few feet at the first dozen strokes, but at the end of the first half mile the positions were reversed, and the bow of the Cambridge boat showed four feet in advance of that of her adversary. The boats led alternately, neither gaining any decided advantage, and without daylight appearing between them, until the last bridge was passed, and but three-quarters of a mile remained to be rowed, and Oxford was almost a clear length ahead, when it was seen that something was wrong with their bow-oar, and the boat was crippled. The Cambridge crew spurted, and soon drew up abreast, but the seven Oxford men worked like giants, and in 24m. 10s. from the start, the gun announced that the race was over. It was at first supposed that Oxford had won, but the decision of the judge was "a dead heat." The *Pall Mall Gazette*, on the evening of the day of the race, commented upon the finish as follows:

"When Barnes' Bridge was reached, Oxford had a clear yard or two lead, and seemed to have the race in hand. They were rowing, apparently a trifle within themselves, while Cambridge was rowing a faster stroke, throwing up some water, and losing ground. But after passing the White Star, there was a lurch and stoppage in the Oxford boat. The bow's oar had cracked or sprung, and from that point he was unable to feather it against the head wind or make any practical use of it. The stoppage brought Cambridge up instantly, till their bows were amidships of Oxford, and the latter were left with half a length's lead, half a mile from home, and little more than seven oars to get there. The seven uncrippled men kept well together. The bow, with his oar in trouble, was at see-saw with the rest, and often could not put his blade in the water at all, but had enough to do to save it from catching water as it dropped. The Oxford rudder was put hard on to keep the balance of four oars against three.

The crews and their weights were as follows:

OXFORD.	lbs.	CAMBRIDGE.	lbs.
Bow—D. G. Cowles, St. John's	157	Bow—B. G. Hoskyns, Jesus	153½
No. 2—*J. M. Bonstead, University	178	No. 2—*T. W. Lewis, Caius	165
No. 3—H. Pelham, Magdalen	176	No. 3—J. C. Fenn, First Trinity	163
No. 4.—W. H. Grenfell, Balliol	173½	No. 4—*W. B. Close, First Trinity	163½
No. 5—*H. J. Stayner, St. John's	180	No. 5—L. G. Pike, Caius	179½

		*"Old Blues."	

PLAIN CHICKEN SOUP.—Cut up the chicken and break all the bones. Put it in a gallon of cold water; let it simmer for five hours, skimming it well. The last hour add to cook with the soup a cup full of rice or barley, and a sprig of parsley. When done let the kettle remain quiet a few moments on the kitchen table, when skim off every particle of fat with a spoon. Then pour all on a seive placed over a dish. Take out all the bones, pieces of meat and parsley; press the rice through the sieve. Now mix the rice by stirring it with the soups, until it resembles a smooth *puree*. Season with pepper and salt.

National Pastimes.

BASE BALL.

—The Hartfords, of Brooklyn—the new representative professional team of the metropolis—opened play in a practice game at Prospect Park, on March 24th, the day being the first spring afternoon they had had for the purpose. There was a large attendance of spectators, considerable interest being manifested in the new Brooklyn team. The Hartfords did not have Allison, Holdsworth, or Start, but the rest of the team were on hand, Harbidge, Larkin, Burdock, Ferguson, Carey, York, and Cassidy, playing in their regular positions; Start and Holdsworth's places being filled by Nelson and Quinn. The field side was a strong one, including the well-known League Alliance and International Club players: Knowdell, McCormick, of the Buckeyes; Dunn, McGuinness, Thompson, Daly, Roche, McGlynn and Bunce, filling the nine positions creditably. The pitching was very effective on both sides, but few runs being earned on base hits scored. The runs by innings were as follows:

Hartford	0	4	2	0	0	0	4	0	0	—10
Field	1	0	0	0	0	2	0	1	0	—4

Umpire, Mr. Duchorme.

—The record of the tour of the Indianapolis Club up to the 22d inst., is as follows:

March 10	Indianapolis vs. Dallas, at Galveston	50 to 0
March 11	Indianapolis vs. Galveston, at Galveston	59 to 0
March 12	Indianapolis vs. Pastime, at Galveston	30 to 0
March 15	Indianapolis vs. R. E. Lee, at New Orleans	13 to 0
March 15	Indianapolis vs. R. E. Lee, at New Orleans	8 to 0
March 18	Indianapolis vs. Memphis, at Memphis	7 to 8
March 19	Indianapolis vs. Memphis, at Memphis	5 to 3
March 20	Indianapolis vs. Memphis, at Memphis	9 to 8
March 21	Indianapolis vs. St. Louis, at St. Louis	3 to 6
March 22	Indianapolis vs. St. Louis, at St. Louis	6 to 4
Total		178 18

The victory scored in St. Louis was a noteworthy one, and it puts Indianapolis stock well up in the market.

—The Hartfords will practice every fine afternoon this month on the Capitoline grounds until the Union grounds are in good condition for regular play.

THE MILLER-BAUER WRESTLING MATCH.—Probably the most wonderful and protracted exhibition of human skill and endurance which has ever been known was witnessed in this city on Tuesday night of last week. The occasion was a Greco-Roman wrestling match between Thiebaud Bauer and William Miller. Bauer weighed, 192 pounds, and Miller 197, both giants in frame and strength. From eight o'clock in the evening until twenty minutes past five in the morning they strained and pushed, and hugged without the match being decided, although Bauer won one fall forty minutes after the opening. Both men were terribly in earnest, and when the referee, with the bright morning light streaming into the cold and cheerless building, ordered them to desist, it was with bodies sore and blackened with bruises.

NEW YORK ATHLETIC CLUB.—The eighth annual spring games of the New York Athletic Club, open to amateurs, will be held on the afternoon of Wednesday, May 30th. The programme is as follows: 1. 100-yard trial heats. 2. Throwing the hammer. 3. One-mile run. 4. 100-yard second trial heats. 5. Seven-mile walk (during which will take place running high jump, in the order named). 6. 100-yards final heat. 7. 440-yard trial heats. 8. One-mile walk. 9. 220-yard trial heats. 10. Tug of war, trial heats. 11. 120-yard hurdle race, trial heats. 12. 440-yard final heat. 13. Three-mile walk (during which will take place pole-leaping). 14. 120-yard hurdle race, second trial heats. 15. 220-yard final heat. 16. Tug of war, final heat. 17. 120-yard hurdle race, final heat. 18. One-half mile run. First two in each trial heat allowed to run in second trial heats, and first two in each second trial heat allowed to run in final.

UNDOUBTEDLY one of the best and cheapest stocks of Carpetings, Oil-Cloths, Mattings, etc., etc., to be found in the United States is that of Messrs. JOHN H. PRAY, SONS & CO., Washington St., Boston. I. W. Adams is the sportsman of the firm, and will take special pains to please any of our friends calling upon him, or with any orders sent him. It is a good, reliable house.—*Ads.*

Tiffany & Co., Silversmiths, Jewelers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their timing watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. Tiffany & Co., are also the agents in America for Messrs. Patek, Philippe & Co., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Bronzes and Artistic Pottery is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. DITTMAR POWDER WORKS
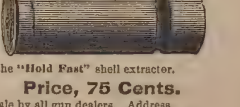
MANUFACTURERS OF
Titan Powder, Dualin, Rifle, and Shot-Gun Powder.
175 WASHINGTON ST., BOSTON, MASS.



The attention of Riflemen and Sportsmen is called to the Rifle and Shot-Gun Powder which Mr. Dittmar has succeeded in bringing to a state of perfection. For cleanliness, pattern, penetration, range, uniformity, little smoke, recoil, report, and heating of barrel in rapid firing, this powder is unsurpassed.

If this powder becomes wet by exposure, it can remain so for any length of time without injury, it being just as good after drying as before.

The Dittmar Titan Powder and Dualin, for blasting and mining purposes, are now in general use, and stand at the head of this kind of explosives. Mar.29 tf

Paints.

PROTECT YOUR BUILDINGS.

Which may be done with one-fourth the usual expense, by using our

Patent Slate Paint.

(Fifteen Years Established.)

MIXED READY FOR USE.

Fire-proof, Water-proof, Durable, Economical and Ornamental.

A roof may be covered with a very cheap shingle, and by application of this slate made to last from 20 to 25 years. Old roofs can be patched and coated, looking much better, and lasting longer than new shingles without the slate, for

One-third the Cost Re-shingling.

The expense of slating new shingles is only about the cost of simply laying them. The paint is FIRE-PROOF against sparks or flying embers, as may be easily tested by anyone.

It Stops Every Leak,

and for tin or iron has no equal, as it expands by heat, contracts by cold, NEVER CRACKS nor scales. Roofs covered with Tar Sheathing Felt can be made water-tight at a small expense, and preserved for many years.

This Slate Paint is

EXTREMELY CHEAP.

Two gallons will cover a hundred square feet of shingle roof, while on tin, iron, felt, matched boards, or any smooth surface, from two quarts to one gallon are required to 100 square feet of surface, and although the paint has a heavy body it is easily applied with a brush.

No Tar is Used in this Composition

therefore it neither cracks in winter, nor runs in summer.

On decayed shingles it fills up the holes and pores, and gives a new substantial roof that will last for years. CURLED OR WARPED shingles it brings to their places, and keeps them there. It fills up all holes in felt roofs, stops the leaks, and although a slow dryer, rain does not affect it in a few hours after applying. As nearly all paints that are black contain TAR, be sure you obtain our genuine article, which, for shingle roofs, is

CHOCOLATE COLOR,

when first applied, changing in about a month to a uniform slate color, and is, to all intents and purposes, SLATE On

TIN ROOFS

our red color is usually preferred, as one coat is equal to five of any ordinary paint. For

BRICK WALLS

OUR BRIGHT RED is the only reliable Slate Paint ever introduced that will effectually prevent dampness from penetrating and discoloring the plaster.

These paints are also largely used on out-houses and fences, or as a priming coat on fine buildings.

Our only colors are CHOCOLATE, RED, BRIGHT RED and ORANGE.

W. & C. SCOTT & SON'S.

First Prize Medal and Diploma awarded Centennial Exhibition, for excellence of workmanship and material in their **Premier Quality** and medium grades. Their **New Patent Triplex** Lever Grip Action and **Compensating Lump.** The attention of sportsmen is requested to the above new action. Its superior strength and solidity impart greatly improved shooting powers. Hard hitting, being the desideratum required, is obtained by this powerful gun. Prices of the New Triplex Lever Grip, $175, $225 to $400. Marked the Triplex 10-bores extra. Our highest grade is as usual marked the PREMIER QUALITY.

Extract from FOREST AND STREAM, *New York, December 26, 1876, Contributed by one of the Judges of Awards of Guns at the Centennial:*

This action (The Triplex Lever Grip) combines in the highest degree strength and simplicity, and must rapidly secure the favor of all who test its merits.

COMPENSATING LUMP. Strongly recommended. It is invaluable, and should be ordered on every gun. Costs about $10 extra. Choke-bores, medium or full. Our guns to be had of the principal dealers in the trade only.

ADIRONDACK GUIDE.

BY E. R. WALLACE.

Gives all possible information relative to Routes, Hotels, Resorts, Outfits, Guides, Distances, &c., with amended railway schedules, &c.

The Only Complete Guide to the North Woods.

The instructions embrace everything that can be desired. Taking it all in all, it is the most complete book that has been published on the Adirondacks, not excepting even my own—*Hon. J. T. Headley.*

I regard your "Descriptive Guide" and the "Appendix" as a most useful—nay, indispensable, manual for tourists to that wonderful Wilderness. A tour in that region is eminently a practical matter, and for that reason I regard your "Guide" as an important, useful, and timely publication.—*Benson J. Lossing.*

It is the *only* thing of the kind that has yet been published—the very thing that has been so long wanted and waited for.—*Alfred B. Street,* Author of "Woods and Waters."

THE SILENT POOL.

BENEATH the surface of the crystal water
Metallic shines a floor of frosted green;
Uneven, like a depth of emerald lichen,
Thro' ranks of dark weeds gleams its fairy sheen.

Horsetails of varied growth and plumage sombre,
Like ancient warriors in dark armor dight;
Like fair young maidens' arms the prism-hued grass leaves,
Clinging in fond embrace before the light.

Round and about this silent pool the ash-trees
Bend down in thirsty eagerness to drink;
Amid their gray-green leaves show, keenly vivid,
Long-feathering laurel sprays that clothe the brink.

High up in air, some thirty feet or over,
A wild white rose above the footpath clings;
Fearless she clasps a tough, unyielding ash-trunk,
And o'er the pool gay wreaths of blossom flings.

Idly I drop a pebble in the water,
Each sombre horsetail nods a plumed head;
Like pearl or opal gem, the stone sinks slowly,
Transmitted ere it reach its emerald bed.

Mystic the emerald hue beneath the water,
Weird like this tint by which the scene is haunted;
Vainly I ask my senses if they wake,
Or is the deep and silent pool enchanted?

Now as the widening ripple circles shoreward,
The plumed dusky warriors flie away;
The slender grass blades wave bright arms imploringly,
Streaking with tender green the grim array.

Leafless, a gaunt-armed giant oak, storm-scathed,
In gnarled bareness overhangs the pool;
Fantastic show its knotted limbs contorted,
Grotesque and gray among the leafage cool.

Caught here and there amid the feathered foliage,
Are glimpses of the far hills' softened blue,
While overhead the clouds, snow-white and fleecy,
Float slowly on a yet intenser hue.

From Norman times 'tis said, maybe from Saxon,
This calm tree-circled lake secluded lay,
Pure as an infant's breast, its crystal mirror
Baring its inmost depths to gaze of day.

Some specks there are, some clay-flakes on its surface,
To open view revealed, like childish sin;
No roots have they, nor downward growth, to canker
The purity that dwells the pool within.

Mystic the em'rald hue beneath the water,
Fairy the tint by which the scene is haunted;
Vainly I ask my senses if they wake,
Or is the clear and silent pool enchanted?

The swallow flits two-bodied o'er the water,
Its four wings like a wind-mill's sails out-spread;
Through the dark horsetails shoot the silver grayling,
To seize the May-fly skimming overhead.

Flying from lawless love—so runs the story—
A maiden plunged beneath this silent wave;
There, where a holly sits the bank so closely,
She sprang and sank—beyond all power to save.

Six-hundred years and more since that dark legend—
Legend that stained a king with lasting shame—
And still the deep and silent pool lies crystal—
Crystal and clear as that poor maiden's fame.

Yet mystic is the hue beneath the water;
Unreal the tint by which the scene is haunted—
Again I ask my senses if they wake,
Or if the silent pool's indeed enchanted?

—*K. S. M., in Macmillan's Magazine.*

For Forest and Stream

A Trout Stream in Canada.

IN one of my numerous fishing excursions in search of new streams to conquer, I met an Englishman named Barnes, who for a whole season was, in a piscatorial sense, a source of much unhappiness to me. How, or when, he came to the county I know not. I had my own surmises, that he might be an escaped convict or poacher. In height he looked quite six feet, or perhaps a trifle over, and I had one of the most powerful physiques I ever saw. He had not an ounce of superfluous flesh on his bones, yet so compact and well knit was his frame, that he gave one the idea of being a much heavier man than he really was. His face was a study in itself. Under prominent brows of iron gray hair, a pair of shrewd, gray eyes were shadowed at pleasure, or flashed out bold and keen when it suited his humor. A firm, cruel mouth, tightly compressed, lay under a nose which defied description, its original shape having been entirely lost, owing probably to various fisticuff encounters, in which I have no doubt its owner had played an able part. A long, waving scar started from the left side of his slightly receding forehead, extended to the level of the lobe of his left ear, and vanished in the iron-gray whiskers, which completely surrounded his face, and formed an apt setting for a countenance which might have served as the original for the far-famed "Bill Sykes." Barnes' age might have been placed anywhere between forty-five and sixty. His costume consisted of an old billy-cock hat, a much-worn, brown velveteen shooting jacket, fairly riddled with innumerable pockets, a waistcoat and breeches of the same material, the latter extending to the knees, where they were met by leather leggings which fitted closely over stout brogans armed with huge nails. On all the occasions upon which I have had the honor of meeting him, he either had a fishing basket strapped on his shoulders, and carried a trout rod and landing net, or the fishing basket was replaced by a game bag, and the rod and net by a serviceable looking double-barrelled gun.

Having introduced the man, I will now describe his habitation. It was situated on the southern side of a hill, distant some five miles from the village of Blank, and consisted of a substantially built log house. The house was surrounded by a double stockade, the inner line of stakes being shorter than the outer, and sharpened at the top. A similar enclosure about ten feet wide led from the outer to the inner line of stakes. At each end of this enclosure or passageway was placed a high gate, the innermost one opening into a covered way which led into the log house. The habitation was characteristic of the suspicious nature of the man, and was evidently constructed with the idea of holding it against all comers.

The cerberus of this stronghold was one of the most powerful and savage looking bulldogs I ever saw, and in himself quite sufficient to deter any one from prying into the secrets of Barnes' habitation, or the why and wherefore of his having, in a civilized country, housed himself in such an extraordinary manner. His landed estate was sufficient to admit of a potato patch, and afford subsistence for his stock, which consisted of a pig and some poultry. Barnes had neither wife nor child, nor, so far as I know, relatives of any kind living. There was not a house within several miles of his, if I except the deserted log cabin, once inhabited by an Irishman named Murphy. The latter was the only person who was ever admitted to terms of intimacy by Barnes. The man Murphy I never saw, but he must have been, in a different way, quite as original a character as Barnes himself. Murphy was notorious in the neighborhood for the extraordinary manner in which he gave his evidence in the county court in a case where a man named Morgan was tried for the murder of his wife.

On being placed in the witness box, Murphy testified as follows:

"It was afther tin o'clock in the mornin', an' seein' no smoke at Morgan's, I suspicted there was somethin' out o' the way, an' goin' over I looked in at the wind'y, and see Tom sitten' there furnins't the stove."

"'Tom' sez I.

"'What,' sez he.

"'Are ye there,' sez I.

"'I am,' sez he.

"'Where's Molly?' sez I.

"'She's in there,' sez he, pointing to the room beyant.

"'Is she did,' sez I.

"'She is,' sez he, "as did as a dure nail.'"

To return to our friend Barnes. I have said that Barnes was a source of much unhappiness to me. My unhappiness was, perhaps, some might say, the result of envy, inasmuch as Barnes was aware of the existence of a stream, the whereabouts of which was unknown to me, and from which he procured an apparently never failing supply of beautiful brook trout; frequently, when returning from an unsuccessful whipping of the streams in the neighborhood, unsuccessful compared with the doings of Barnes, for I seldom returned entirely empty-handed, I would fall in with Barnes fairly loaded down with the speckled beauties of the brook. All my efforts to discover the source from which he drew his finny wealth were unavailing. Whenever, in answer to a query of mine, as to where he caught his trout, he would, with a leer on his weather-beaten old face, reply "Well, master, I just hooked 'em out'en Healy's Brook." I instantly convicted him in my own mind of having given utterance to a wilful and mendacious falsehood. On these occasions he would attribute my want of luck to my inexperience.

"Wrang time o' day" or noon, etc.

With regard to Healy's brook, there certainly was trout in it, as many a bare-legged urchin perched on the bridge which spanned it on the little by-road which led to nowhere, could testify. These urchins would occasionally pull up a trout or two of fairish size, and sometimes of such goodly proportions as to tip the beam at a pound or so. But these cases were the exception, and only served to prove that somewhere on the brook there must be haunts, unknown to any one except old Barnes, from which they had strayed to become the prey of a wading boy. Numerous were the expedients which I tried to get even with old Barnes, but one after another failed, and at last I was fairly driven to desperation, and to discover the source of old Barnes' success became a mania. One day I would try the stream from the little bridge down to the river, of which it was a tributary, but all in vain. True, I would get an occasional trout, worthy of being netted, but this only served to convince me that at some places on the brook there was excellent fishing, and those places had yet to be discovered. Again, I would whip the stream upward from the bridge; but in this direction also the task seemed hopeless, for the brook, after babbling along through pleasant places for a mile or so, and affording a trout or two to lure me on, flowed through a frightful swamp, hedged in with windfalls and the debris of ages. Had I only persevered and fought my way through that reeking morass, my trouble would have speedily ended—so often are we when on the very verge of a discovery disappointed. However I am anticipating. Being driven at last to the conclusion, that unless I gained the desired information from old Barnes, his Eldorado would be forever closed to me, I determined to cultivate his acquaintance. I soon discovered that I had set myself no easy task, Barnes, for a man of his class, being singularly reticent and unapproachable. My first advances met with a signal repulse, and almost completely discouraged me. It happened in this wise. I met him one rainy afternoon trudging toward the village, and stopping him, I said:

"Well Barnes, what luck to-day? rather a bad day for fishing, isn't it?"

"I doan't say that master," he replied "the day's all roight for them as has the hang o' coaxin' the fish up; I can coax them up when it's rainin' cats an' doags."

"Ah yes," I said; "but then you are an experienced angler, up to all the dodges, and know every spot in the county where a trout can be found."

"I dunnot say as there's much in knowin' the best places, but them as knows how can a' most allus coax up a trout when they loikes."

"Have you filled your basket to-day?"

"Noa, it's not a day to fill a basket, but you can look for yoursen master" and he lifted the lid of his basket, disclosing a dozen or more of handsome trout, some of them up to a pound and a half in weight.

"Did you catch those far from here," I ventured.

"A stout pair o' legs wunnot take more'n an hour i' the doin' o' it, but I must be goin' master; good day to ye."

Just as he was trudging off, I brought him to a halt again, and with a faint hope of still getting something out of him, proffered him a dram from my flask. At this his face brightened up with intelligence, and I thought I had him, as with unwonted benignity he accepted my proffer.

"Here's better luck to ye, maaster," he said, as he put the flask to his mouth, and drained it of its contents, his lips going off with an explosion like a sky-rocket, as he finished.

"Thank ye, maaster," he said, returning me the empty flask, "that's the roight sort."

Then, at a sturdy gait, he walked off again, leaving me completely baffled and discomfited. I now tried my hand at getting information from the natives, but what I learned only tended still further to whet my curiosity. Old Barnes had the reputation of taking fish when no one else could, and, in fact, when he pleased, or whenever it was his interest to do so. If any one wanted trout, all they had to do was to offer a sufficient remuneration, and Barnes was never known to fail to be up to time with his basket of trout. To my inquiry, as to where he fished, the invariable reply was, "Healy's brook." True, no one had ever caught him in the act of fishing Healy's brook, nor had any one who fished Healy's brook ever approached anything like the success attained by old Barnes. Yet the fact, as to whether he ever fished Healy's brook at all, was never questioned. On following up the subject, I learned that old Barnes was a day or more absent on his fishing expeditions, which was assuredly a longer time than could be spent, speaking piscatorially, to advantage, on any part of Healy's brook known to me. Putting this and that together, I surmised, that so far as fishing Healy's brook was concerned, old Barnes' was a fraud,

and that his success was due to fishing some other stream, possibly only known to himself. This conjecture once having entered my brain, I determined that there was but one way to solve the question, and that was, to dog old Barnes!

Now, this dogging old Barnes, although imperative, was anything but a comfortable subject for contemplation, and the more I looked at it the less I liked it, inasmuch as old Barnes would most likely prove to be the last person in the world who would quietly submit to any such operation as dogging. On the contrary, there was every reason to believe that he would show fight, and in that case, the dogger would be sure, supposing that individual to be myself, to come off second-best, and, perhaps, be thankful to escape with his life from the powerful thews and sinews of old Barnes. Yet, something must be done. Old Barnes was not only making me unhappy—he was wrecking me mentally and physically. He had, in fact, become my *bête noir*. At last the climax came—old Barnes began to trouble my dreams. I dreamed that I put in operation my plan of dogging him; that he turned upon me, and in the twinkling of an eye pitched me into the brook, and was, in the facile manner in which such things are managed in dreams, in the act of coolly fishing me out with his landing net, when I awoke from an unrefreshing slumber.

Fully determined to accept all risks and dog old Barnes, I started out one fine afternoon in June in hope of getting sight of him. I crossed the little bridge at Healy's brook, and had walked about three miles in the direction of old Barnes' stronghold, when I was suddenly brought to a standstill by seeing that worthy himself, basket on back, and rod in hand as usual, cross slyly out of the woods on the upper side of the road. Convinced that he had not seen me, I concealed myself in such a way as to be invisible to and yet able to watch him.

He looked about him suspiciously for a moment or two, trying to discover whether he had been observed; then, apparently reassured, he turned toward the village. When within twenty feet of where I stood, he, to my horror, suddenly halted, shifted his evidently weighty basket from his shoulder to the ground, and seated himself upon a stone at the roadside. A pretty situation, truly. I thought he had seen me, and determined to bring matters to an issue. Fortunately, I was mistaken, as, after resting himself, he arose, put on his basket, and walked off, muttering to himself in a curious monotone. As soon as he was out of sight, I walked rapidly to the place whence he came out of the woods, and at once struck in. After stumbling about for awhile in the underbrush, I found the semblance of a path, or deserted road. I followed it for about a mile, when it abruptly ended. I then started off in a direction which would intercept any brook flowing toward the main river. A couple of miles further on I heard the splashing of a rapid stream, and in a few moments—Eureka! I was on the banks of as charming a trout stream as ever feasted the eyes of a humble disciple of dear old Isaac. This was the main stream, and Healy's brook was only a branch. Had I pushed through that reeking morass, I would have come on the main stream a little higher up than where I now stood.

The poet might have had just such a brook in view, when he wrote his exquisite lines:

> "Whyles owre a linn the burnie plays,
> As through the glen it wimpl't;
> Whyles 'round a rocky scaur' it strays;
> Whyles in a wiel it dimpl't;
> Whyles glittered to the nightly rays,
> We' bickering, dancing dazzle;
> Whyles cook it underneath the braes,
> Below the spreading hazel."

I had not brought my fishing tackle with me; but, nevertheless, as much of the true angler's enjoyment is derived from an appreciation and love of the beauties of nature, I thoroughly enjoyed my walk under the rustling boughs, and through the tangled undergrowth, fragrant with the perfume of myriads of ferns and flowers just bursting into bloom. The next morning I was off at sunrise to profit by my lucky discovery. Carefully retracing the route I had followed the day before, I reached the stream without mishap.

About twenty yards above the place where I stood the brook tumbled over a ledge of rocks into a deep pool. Just at the tail of the fall I hooked and netted two very pretty trout, neither of them quite up to a pound, but not to be despised, and an earnest of what I might expect.

A little to the right of the fall there was quite a deep pool—rather a difficult place to fish, owing to the overhanging trees. After several failures, I made a cast to my mind. Splash! splash! two of them. Well, I would have been satisfied with one at a time; but I reeled them in, and netted as pretty a brace of trout as ever were hooked, weighing about one pound and a quarter each.

A few more casts without a rise, and I was about moving up stream, when splash! Ah! "a big 'un," as old Barnes would say; and I quite agree with him, when, at the finish of a brisk little fight, I reeled in and netted a two-pounder. Another cast or two without result, and I clambered over the rocks at the little fall, on my way up stream. Above the falls there was a long run of shallow, quick water. Away, at the end of the vista, under the hanging boughs, the blue sky and fleecy clouds of the loveliest month of all the year—"the leafy month of June"—glimmered at the summit of a picturesque cascade, which tossed and fretted from a height of thirty feet to the dark pool at its feet. Wading up through the shallows to within casting distance of the broken water and pools under the cascade, I hooked and netted thirteen trout, ranging from one-half to one pound and one-half in weight. I have no doubt I might have caught as many more at this spot, but bent on exploration, I made a detour, and came out a little further up stream above the cascade.

Here I found another long stretch of tumbling, swirling water, interspersed with falls and rips. My basket now began to weight me, as I picked up the shining beauties by two's and three's, in the rips and pools. Close behind a jutting rock, and in the quiet water inside of an eddy, I saw a heavy rise, and tried every means of getting my flies there, but the overhanging trees bothered and prevented my doing so. Finally, I waded to the opposite side of the brook, and well above the place where I saw the rise, made a cast, and permitted the line to float down with the current, a little below the eddy, then worked it over to the spot—splash! and I have him fast. This fish proved to be a lively fellow, and made some desperate runs, obliging me to follow him up and down the brook, and leading me into all manner of wet, slippery, and unpleasant places. But at last I reached a spot where I could safely net him, and his race was run.

This trout was quite a big fellow, touching three pounds in weight, as also were two others, which I caught out of the same pool.

I afterward learned that very heavy fish, reaching five and six pounds, were often taken further up the brook, and just below the dam on the big lake, out of which the brook flows. When the dam was raised for river driving, was said to be the best time. Strange to say, that was the only time the brook was fished by the natives, and then only for a short distance below the dam. Old Barnes was wiser, and profited thereby; but then old Barnes was an angler. I now had quite as much weight as I cared to carry, and was just wading round a projecting rock on my return, when, who on earth is this? As sure as I live, it's old Barnes! He was fishing one of the pools I had passed, and was in the act of playing a heavy trout.

My dream presented itself to me with such frightful distinctness that I almost tumbled into the brook. The next instant old Barnes saw me, and for once the fox, surprised out of his usual self-possession, slackened his line for a moment, and his prey was gone.

"That was a big 'un, maaster," he coolly remarked, and resumed casting.

Retribution had overtaken him at last. He knew that I was in possession of his secret. PASSAMAQUODDY.

For Forest and Stream.

BEAR HUNTING IN MISSISSIPPI.

PERHAPS no section of country has been such a paradise for game as that part of the State of Mississippi lying between the Tallahatchie, Coldwater, and Mississippi Rivers. In 1833 my grandfather emigrated to Panolo County, Mississippi, from Tennessee, allured by the exceedingly productive soil and the enormous quantities of game. He there entered a large amount of government land, and remained the rest of his life. Himself and his three sons became noted for their success as bear and deer hunters. My grandfather owned the best pack of bear dogs that the country afforded, and many a bear became their victim. During one winter his eldest son was in at the death of forty-five bears. The old gentleman was very careful of his dogs, and would allow no one to hunt them unless he was along to take care of them, the great danger consisting in their being killed or crippled by a wounded bear. One Sunday the family had all gone to church except my youngest uncle, who was then ten years old. He had frequently begged permission of his father to accompany him on a bear hunt, but had always been refused. He recognized this as his chance, and when the folks were well out of sight, he took down the heavy rifle from the hooks over the door, slipped the amunition-pouch over his shoulder, and started for the bottoms with all the dogs at his heels. He had gone about two miles, when the dogs struck a trail, and off they went; their continuous baying soon announced that the game was treed. Making his way cautiously through the dense undergrowth in the direction of the dogs, he soon found them making it very hot for an old she bear. She was occupying what is termed a clay root, formed by a large tree having been blown down. The old Madam was in this hole with her back to the tree roots, and the dogs on all sides of her. He observed a log lying near by, that commanded a good view of the show; he slipped the old rifle across the log for a rest, not having strength to hold the old fusee at arm's length. Taking deliberate aim at where he supposed the bear's heart to be, he pulled the trigger, and the old flint lock snapped. This he did a second time, with the same result. He then reprimed her, and making a third attempt was successful, the old gun spoke, and the heavy ball went crushing through the bear, killing her instantly. This was a very happy termination; he was not more than twenty paces from the bear, and if she had discovered him when he was attempting to shoot, or had only given her a bad wound, it would have been all day with the lad. A kind providence cared for the fearless youth on that occasion, and on many others of a similar nature, and his life was spared, to be offered up a willing, but useless, sacrifice to the demon of secession, on that terrible Seventh of August, before Atlanta, where he fell at the head of his company, shot through and through by a minie ball; and though laid away to rest in that little country graveyard in Georgia, your memory, my dear uncle, is still fresh and dear in our hearts, and time will never be long enough to efface the recollections of your noble, fearless nature. But to resume: Game, always plentiful in that section, became much more abundant during the war, when all who could handle arms were at the front. I have seen five deer in one bunch, within a quarter of a mile of home; turkeys could be found every day in season; squirrels and quail were on all sides; and the bears became so numerous, that they committed extensive depredations upon cornfields and hogs. One field in particular, known as "the hurricane field" (so-called from having been visited by a tornado, uprooting nearly every tree), lying about a mile from the house, and containing some two hundred acres, had suffered especially from their devastations; on the back side of this field was a strip of late corn, of about eighteen acres, that was well-nigh devoured by the bears. I was then a lad, sixteen years old. One Saturday afternoon, Old Uncle Jack, a colored factotum, came to my Cousin J. (three years older than I) and myself, and told us, "De bar were just goin' for dat piece of corn on the back side of de hurricane," and advised us "to go fur de bar." Cousin J. had suffered from infancy with sore eyes, and it was about all the poor fellow could do to see "a bar" by daylight, let alone hunting him at night. Nothing daunted, we concluded we had lost some "bar," and commenced preparations. It was then about two hours by sun, and no time to lose. Taking an axe, we started for the field to reconnoitre and to select our positions, and arriving on the ground, soon found the tale not at all exaggerated. The field looked as if fifty bare-footed negroes had been traveling around in all directions, and there was scarcely a stalk of corn that had not been broken down. After a careful examination of the premises, we finally chose for our position one of their most prominent trails for going in and out of the field. The fence, a substantial rail fence, had been partly broken down where they climbed over, and the top rails were worn smooth as glass by the friction of their rough, hairy bellys in sliding over. Having so short a time for preparation, our plans were very crude. Our idea was to make a platform adjacent to his crossing-place, sufficiently high to prevent him from scenting us. Hastily felling a small sapling, and a couple of forks, we soon had a roost made, putting one end of the sapling in a fork on a small tree, and supporting the other end by our forks, the horizontal pole being about eight feet from the ground. No time was allowed for anything more extensive. Hurrying home, our suppers were soon bolted, and our guns brought forth. A description of the guns may be in order. J. had borrowed from a freedman an old Sharpe's rifle, rusty and dilapidated, and, as afterward transpired, had been loaded since the previous winter. The owner, however, assured J. that it was lately loaded, and would be sure to go off in order. My gun was an old, double-barrel, muzzle-loading shot-gun, and with it I could do fair execution at small game. There was one little defect that somewhat marred our evening's enjoyment—the left tube was badly rust-eaten, and on the inner side of the tube there was a rust hole clear through to the inside. I loaded the gun as heavily as was prudent; in each barrel were six navy balls (not having any buck-shot). In addition to this formidable arm, I buckled a belt containing a navy revolver to my waist, and off we went, feeling capable to handle all the bears in the Miss. bottom. We got to our stand just at dark, and carefully went to roost, and being the most venturesome, I sat about midway the pole, my legs dangling in the air, J. occupying the end of the roost next to the tree. We had hardly settled into our positions, before the musquitoes settled into *their* positions, and, Gracious Peter! we thought they would carry us off, *nolens volens*. It being the latter part of August, and the nights cool, they soon left us to more pleasant reflections. A new moon gave a faint light, and all was quiet, save an occasional hoot from an owl. I never expect to be in a more lonesome place than that seemed to us; and we were sure the thumping of our hearts would scare all the bears out of the woods. Once or twice, to relieve the monotony, I drew my gun up to my face, and carefully sighted an imaginary bear, much to J.'s annoyance. That lost interest for me, and it began to grew tiresome to us in our constrained positions. We had then been there about one hour, and I was sitting with my gun across my lap, looking at the ground, and wondering how long before I would probably be conscripted, when I mysteriously became aware of a presence. Raising up my eyes, and glancing down a trail that ran along the fence, I saw, not twenty-five steps away, a great, gaunt bear. The brute seemed as long and tall as a cow, and had come up the path as noiselessly as fate, and arriving at that point, had, no doubt, scented trouble, and stopped motionless. As I raised my head to him, he discovered me, and there we gazed. Realizing that the time for trouble had come, and not saying a word, I carefully and deliberately cocked the right-hand barrel, and raising the gun to a level with his breast, pulled trigger. That infernal old tube on the left barrel caught fire from the right, both barrels went off, I went off, and the bear went off badly crippled. I knew if the old cuss was past traveling he would make it hot for me, and between the time that I was thrown backward from the pole and struck the ground, I had drawn the old navy, cocked it, and was ready for business at close quarters, but, luckily for me, his wounds did not prevent his running, as only a scared bear can run, through a cane-brake. He made more noise than a six-mule team would have made, going over the same ground on a keen run. As the last echoes of his departing lordship died away, J. recovered from his amazement and affright sufficiently to inquire, "What was the matter?" and catching sight of my dim outline on the ground underneath, it was all I could do to keep him from attempting to discharge that old Sharpe's rifle at me. Perhaps I will never fully understand the danger I was in, if my shot had disabled the bear so as to prevent him from running—with a wounded bear under me, a scared boy above me, and a scared boy in me. As it was, I escaped with a bad case of compound fracture of gun-stock, a very lame back, and any amount of severe disappointment at losing the bear; however, my loss was his gain, though I have no doubt that if he recovered from his wounds and fright, that he still remembers "my bear hunt."

For Forest and Stream.

THE PINE FORESTS OF PENNSYLVANIA.

THE enthusiastic sportsmen and lover of untamed nature who has not visited the great pine forests of Northern Pennsylvania, has a rich store of pleasure laid away in the future. Even those who drearily imagine there is nothing more worth seeing in this world, and advertise themselves as waiting passengers for the other, might be "spirited up" a trifle if they could be put up in position to get a quiff of the piney odors of these huge mountains—"the colossal smelling bottles of Dame Nature," as a Centennial excursionist aptly named them. Those who fold their hands and lazily think there is "nothing doing," have only to embark for Renovo, and they will be likely to change minds long before they change cars, for they will hear the sound of innumerable steam and un-steam saw-mills. They will see flocks of little, white, innocent, dove-like looking villages, encircling the sturdy forests as though bent on gaining an entrance into their "heart of hearts." Great already is their success. Many a lofty pine which has defied the winds and snows of the changing years is laid low; and these insidious machines, the ponderous engine and the savage saw, buzz forth or shriek out their triumphs. No white-nested village is there so insignificant as not to have its school and its saw-mill; none so idle or so poor but they can set up these twin deities of industry and progress.

Williamsport, one of the largest lumbering towns on the route, has fifty steam saw-mills and many superior schools, and is that renowned place which, in primitive times, was said to have been governed by "fair-play men," who were eventually "spoilt" by the advent of the lawyers. Renovo is not a saw-mill town. It is not celebrated for any "ancient doings" in particular. It is not the site of an Indian massacre, or an Indian treaty, or a poet's cottage. Here a plain (to us), nameless pioneer from Jersey's shore, lived with his family, until bought out by the Philadelphia & Erie Railroad Company, which has established its works there, and converted, with that railroad speed which is the American substitute for "magic," the sleeping, egg-shaped valley into a wide-awake business place, that drowns the soft music of "Susquehanna's floods" with the bustling activity of seven hundred machines. Renovo is a good place for excursionists for general reasons, the most important of which is, because it is midway to everywhere, or practically expressed, because "it is so near, and yet so far;" that is, you are near enough to enable you to get nearer if you desire, and far enough off not to be too near if you don't want to be near. Besides, it has everything comfortable in the way of a fine, commodious hotel. This is undoubtedly a pleasant resort, even though you here made up your mind to "rough it" most vehemently. This pleasant stopping place is situated on the bend of the rumbling Susquehanna, as it turns southward through the mountains, and midway between Hyner and Keating, where the Susquehanna espouses the Sinnemahoning, and is deserted by the railroad, which has followed it industriously for sixty miles or more, but seems now to prefer to follow the "new love" "whithersoever it goeth," even into the gloomy and greasy oil regions of the west. Hyner is also much frequented by sportsmen. The scenery

all about here is magnificent. Round Island, on the Sinnetaoboning, has a beautiful waterfall, forty feet in height, which rings "liquid melodies" while you are attending to the lumber manufactures and surveying the piles on piles and row upon row of the straightened "corpses" of the odorous pine trees. The forests abound in winged and footed game; the streams in brook trout and other varieties. The royal Susquehanna alone boasts of thirty-one varieties. Near Hyner is Young Woman's Town, which has the wildest, crookedest stream of the same name. Why so named is a mystery. Perhaps a blundering attempt was made by some rude fellow of a hunter to fit its name to its nature. After leaving the Susquehanna it runs backward and forward in an inconsistent way, forming a cluster of scallops, and then suddenly splits itself into a multitude of tiny branches, which run off to hide themselves among the mountains. Kettle Creek is another very beautiful and romantic stream. The Short Bend on this stream is a lovely spot, not far from where the Susquehanna turns around the corner of a mountain. One could be content to fish all day in such a "kettle" as this, even if they caught no fish, said our excursion friend. This gentleman's preference was plainly for the "rod." It is a more peaceful instrument, said he. Its intention is clear. It was never made to catch men with, whereas the gun is used for man and beasts indiscriminately, although the Quakers decided long ago, to the infinite derision of the English "Lords Committee of Colonies," "that guns were invented to kill hawks and wolves with instead of men." If, however, you follow any one of these streams out into the green forest you will have ample use for both rod and gun. If you wish to have the full benefit of the ever-changing ever-charming scenery, you can either return to Renovo by a wayward little branch of Kettle Creek, which, attempting to leave the parent stream, and being confronted by some little difficulty in the shape of rocks and mountains, turns around and "whips back" toward the Susquehanna; or, not being anxious to return so speedily, you may follow the fascinating winding of this favorite stream up past Beaver's Dam, Spicewood River, Trout Fork, and Ox Bow Bend, to Cross Fork P. O., and return by Paddy's Run through Tamrach Swamp in almost a direct line to Renovo. To fitly describe the beauty of romance condensed in such a trip is simply impossible.

The vast lumber interests centered in these pine-clad mountains, as well as the hardy virtues of the men engaged in this important industry, are well known. As for the game that can be scared up in this region, the sportsman who will not spend too much time gazing and pondering upon rocks, trees, leaves, and "such," may find a supply as plentiful as the minutes in an hour. Our excursion friend bagged very little, and then left "the bag" on a jagged, moss-headed rock, which overlooked a remarkably fine view. The whole surface in this vicinity is deeply seamed with narrow valleys and ravines spreading in every direction, and marking out the innumerable water-courses. Steep walls of massive rock rise up to lofty heights, supporting the broad table-land, which is crowned with mountains of dense, primeval forests, and stretches far out toward the sea into five points, called the Finger Mountains, of which Mahoopany, Tonawanda, and Blossburg are the most important. This immense forest region lies three thousand feet above the level of the sea, and is sometimes covered during the winter season with snow to the depth of six feet. Perhaps the scenery was too distractingly beautiful to permit the many sportsmen to swing the rod with that masterly patience, or aim the gun with the unerring precision necessary to take effect with those shy inhabitants, who have nothing to do after breakfast but to keep out of the hunter's way. Probably shouts of delight, such as lovers of ferns are apt to indulge in, are not calculated to secure the presence of the dwellers among branches, or in mossy nooks and meandering streams. At all events, our famous excursionist did not secure the forty-pound jack salmon (*S. Americanus*), or an overflowing supply of the lesser freckled beauties of the same tribe, which were the creatures of pre-Renovo visions. He made, however, an important discovery. "I have found," said he, "that the strong odor of pine is excellent for *paralysis of the palate!*" The remedial effects we experienced in this direction were certainly surprising. The morning we left Philadelphia we frowned darkly at the waiter—pronounced our Centennial coffee veritable dish-water and our steak and chickens devoid of flavor. When we returned from our wild-woods tramp to the Renovo dining-tables a "strange glamour was over it all." Never were the "fifteen minutes before train time" so hugely enjoyed. Our host modestly remarked, that "appetite was what was the matter." Perhaps he was more than half right. Perhaps the whetting mountain breezes had sharpened this faculty to such a fine edge as to enable us to find a flavor even in saltless soup and pepperless hash!

For Forest and Stream.

ON TO "G" LAKE.

IN MEMORIAM.

THE bells of the city rang out a merry peal, as a party of eight of its redoubtable citizens moved forward, as aforesaid. I anticipated a cheerful start, but by no means was prepared for such enthusiasm as I saw around me. Many were hurrying to and fro, and, in short, there was a cry of "fire," at the very time when we were thus in pursuit of water, which probably accounts for the commotion. It was a bright May morning, and our ample wagon, red, strong, and handsome, adorned with baskets, rods, etc., stationed early at the appointed rendezvous, received its joyful passengers for an all-day ride. We had arranged to breakfast together at Laverna some twelve miles on the way, where, while the table was preparing, the party amused themselves with the game of quoits, which is one of the readiest, most available, and healthful of your recognized out-door sports.

Where on earth and what is "G" Lake? Such inquiries arose spontaneously in the minds of some in this meridian. For one, I little knew or cared. Enough for me that a jolly party of young men, friends and neighbors, were going there a fishing, and that I was cordially invited to attend—to join them. It was thus, for the time being, the one choice lake of all the woods. Like Abraham, I went out believing, but not knowing whither I went. I have since fully ascertained to my satisfaction, having seen it, that it is a small, semi-circular lake, like the letter G, not far from Piseco. It is down on the map of Asher & Adams in Hamilton County, but not obtrusive in its prominence.

An all-day ride, enjoyable, and not without incident, brought us to the end of the road beyond Morehousville, where we could see or hear nothing of *more house*, where civilization ceased and wild forest life began. There abode Joe Lane and another, who were to accompany us as guides. Where all slept that night I wonder, but cannot tell. Possibly it was in a hay-loft, or barn, where I too have sometimes reposed in analogous circumstances. I was assigned to the prophet's chamber, a small, dark room, whose only means of light and ventilation was through an aperture. However, there was a comfortable bed in it, and I slept soundly, though not dreaming of loves and roses. In the morning we commenced our Pilgrim's Progress—ten in all—each man with a pack on his back, and if not a staff, then a rod, in hand, for a seven-mile tramp, "through ways unknown, tangled, and steep," where no horse could go, as there was not even a bridle-path, and trees were often as thick and close as "blackberries."

One of the most amusing incidents of the route was the crossing of a wide, cold, and rushing stream, where the only bridge was that of a large, long, horizontal trunk of a fallen tree, whose roots were firmly fixed in the opposite bank, whence it extended itself to tapering across, several feet above the water, till we could reach the tip. To get started on it was the difficult thing; and a full half-hour was required to effect the passage. The party crossed apparently in natural order of the weights of its respective members. The lightest man was first over, and then, lighting his pipe, he seated himself, *con amore*, to enjoy the prospect of his successor's struggles. One and another passed, when another—*dipped*. Still another's legs seemed at the mercy of the stream, and were carried under, when he clung sturdily with his right arm to the bending tree, and worked his passage, till, where it was stouter and broader, with a bound he surmounted it. Must I confess that your humble servant was the heaviest man, and therefore last across. But, as an offset to this, I claim to have reached the opposite embankment (I scarcely know how) with dry feet. Laughter interfered somewhat with dexterity. Could we all have refrained from it, we might have made the passage easier. On our return, by the way, a week later, the waters having decreased, and my agility increased, I had the honor of being the first man across.

G Lake is utterly secluded. Bounded by forests and high hills, it is not without attractions. Doubtless it would be more highly estimated if other lakes, larger and statelier, were not near. Such is the luxuriance of our inland water-system, that lakes like G pass frequently under the name of ponds. It was formerly reported famous for its trout, but *Ilium fuit*. Like that of many others, its glory is, in a measure, at least, departed. We were somewhat disappointed. Others had been there before us that very season, and in the wholesale business, too, though Jack Frost had not yet withdrawn. Whatever may have been the cause, we found the fishing nothing extraordinary. There were no boats on the lake, if I except a very small, portable one, which was brought into the service of the lightest man of our company. We fished from rafts already constructed. These consisted of logs, from four to six, according to size, fastened together and covered with bark. Blocks sawn from the logs, answered the purpose of seats. The rafts were moved around from place to place by long poles. They were steady, water-tight, could not be upset, or raced with, but I have known more convenient and desirable conveyances. Two fishermen were assigned to each, but in vain, if fly-fishing was in practice. No experienced fly-fisher will welcome another in the same boat, as lines are thus sure to tangle, and rods are liable to be broken.

An interesting and novel feature of this excursion was, that a photographer was one of the party, prepared with instrument, chemicals, etc., to take pictures of the lake and adjacent scenery, and likenesses of all the fishermen. I relate this the rather, as by experience, having found it entirely practicable, others may be glad to avail themselves of similar advantage. Our artist took us several times in a group, as well as individually, just as we were without one plea, and a wild looking set of fellows we were under the circumstances. Our shanty is in this manner well preserved and perpetuated in remembrance, and even now, with all its tenants and appendages, it is before me. Fine views of the lake, with its rafts and rafters, its sides, and mountains in the back-ground, are still in my possession. On one occasion, when alone on a raft, seated, and in the act of throwing my fly, from a near shore in the woods I heard a voice, but saw no one. It was the voice of our artist, directing me to keep perfectly still for a few moments. I did so. He was about to take a picture of the scene, through the cross-branches of trees, and there I am, visible through said branches, pinioned to this day.

Having returned to Joe Lane's, we separated; half of the party went home and half remained. While there, or in that vicinity, I enjoyed more satisfactory sport and had better success than at the lake, in West Canada Creek. I filled my basket one day with quarter and half-pounders, and caught, at sunset, some particularly handsome trout. Three of us had peculiar luck. *Parvus homo*, in his little boat, had more than he could well attend to to keep from going down stream, and at the same time manage successfully an extra-large customer. However, he was determined, of course, not to lose him, if possible. He held himself close to an alder-bush—*by his teeth*—in order to have full use of his hands. After a very long struggle with fish and tide, he succeeded in capturing a three-pounder; but this was the only one he had to show. He is a very accomplished fisherman; makes the best flies and rods in Central New York, which are much in request. I have one of his rods, and it is a beauty. Homo No. 2, sought a tributary brook, where he was assured that trout were numerous. He caught the most, numerically, but they all were "fingerlings," and should by fair rights have been returned to the stream. I took the medial course, catching neither the largest, nor the most, but more pounds than either, and "the best mess of fish." Indeed, they were a handsome show. So honors were easy, or divided.

Our semi-party, four in all, took a day to visit Wilmurt Lake, enjoying a delightful forest-walk through all the way up hill. There we found a party of greenhorns, who were fast becoming devoured by flies. They complained much, but had no preparations or means of relief. I was happy to furnish them a bottle of fly medicine, which pleased them more than any dainties which could be produced. We were glad to make acquaintance with the lake, and took a satisfactory row over it, not attempting to fish; after which, with thankful hearts and invigorated strength, we turned our thoughts toward Utica, and concluded it was time to sing—

"'Mid pleasures and palaces though we may roam,
There's no place like home, there is no place like home."

AMATEUR.

Utica, January 23, 1877.

—There is nothing more disturbing to the peace of a family than for a brother to attach his sister's "bangles" to his dog's tail.

WHY is a dog's tail like a decrepit old man? Ans.—Because it is in firm.

For Forest and Stream.

DUSKY LITIGATION.

GOLIAH JACKSON was the biggest, the blackest, the ugliest, the-e-e-e—but there, it's no use to attempt a description of him. Any man who could gaze upon Goliah Jackson's physiognomy and physique for ten seconds, and turn round and blaspheme Darwin, is a traitor to his kind.

Goliah was one of those blue-nose niggers, *which* go to sea a little during the fine weather of summer, and loafs round a big fire made of stolen wood during winter. Now, in the place of Goliah's nativity was another "kullud pusson," Mr. Sam, or *Tham*, Johnson, who kept boarding-house, in a tumble-down shanty, for other "kullud pussons," of sufficient respectability. Fall weather having set in with the usual local severity—that is, keen enough to curl a nigger up like a maple leaf, and turn his hide to a dismal mixture of purple, blue, and gray—Goliah decided on no more coasting trips for that season, and took up his quarters with "Mr. Johnsing" for the winter, under a special arrangement as to terms. For a time things went smoothly, but about mid-winter a disagreement took place, and Goliah removed to a rival establishment. Thereupon Sam sued him, for an alleged deficit in the board bill, before the district magistrates. Goliah appeared promptly—coming, the wags of the neighborhood said, in *two* carts—and the trial began summarily. Sam pressed a claim for "free dollaths an' thixty-free thents," which Goliah denied, asserting that he "didn't owe de dam niggah nuffin 'cept a hammin." De charge was seben an' thirpence a week, an' he'd paid up ebry 'vidual red, an' he be cuth'd if he was gwine to pay any mo' on dat sco', so dar now." Besides, he had "done all de cho'es fur de houthe all winter long, 'cordin' to de 'agreement, an' let dat lyin' debbil ob a niggah deny it, if he dar." On inquiry, such proved to be actually the case, the other contestant admitting it, without hesitation, himself.

"Sam," said the magistrate, with asperity, "Sam Johnson, you're an unconscionable rascal. How dare you come here and waste the time of the court, when you've no case at all, by your own showing?" Sam rolled up the whites of his excited eyes like a flash of heat lightning on a summer mid-night:

"I axes your parding, Massa Porter—but I has got a cathe. Dad G'liah owes me, 'caze I can't *'ford* to keep him on dem 'rangements. Why, Massa Squire, jest look at him! Jest look at him! Who can 'ford to keep dat monstrous, great, he nigger, for seben an' sixpense a week; and de cho'es—dam de cho'es! Why, Massa Squire Porter, he breed a faminly in de houthe—he did—de dam wall-eyed, woollen-headed, sculpin-moufed hip-an'-bottom-up-amoth (probably Sam meant hippopotamus), an' I had to go and buy mo' fish an' taters afo' de winter half troo. Ebry mealth's wittals dat brack elemfunt take, he eat free dam great Labrado' herrin', tater accorin', an' G-o-o-d knows how much bread! Seben and sixpence a week, an' de cho'es be dam! Massa Squire, I axes you now, could *you* 'ford to keep boardin' houthe ye'self on dem 'rangements, an' feed sich a mountain ob a niggah as dat, *dat'll eat ole Tophet, an' chase de debbil clar into de middle ob de wilderness?*"

But, notwithstanding Sam's eloquent appeal, *ad hominem*, he was non-suited, and left in high dudgeon, grumbling a threat of appeal to the Supreme Court.

Hantsport, Nova Scotia.

Fish Culture.

MANAGEMENT OF TROUT DURING THE SECOND AND THIRD YEARS.

No. II.

IF the young stock has been skillfully and carefully managed hitherto, the success of the fish farmer is almost certainly established. The really critical periods of fish-life are now passed, save those unforeseen contingencies, which are liable to arise in the form of epidemics among the fishes, or from overflows, which, if not thoroughly guarded against already, are sure to ruin the so far safely conducted enterprise. Yet, the practical fish culturist can discern no period, from the deposition of the spawn upon the hatching boxes until the trout are marketable, in which he can relax his energies or let down his watch over the thousands of wards he has voluntarily assumed to care for, for his own behoof and profit. The period of sojourn of the fry in the first pond is brief indeed. We placed the last of our crop in it about the middle of April, and by the first of November they should be removed, in order that the aquatic plants may have time to grow and the insects, larvæ, and natural fish food of the pond may have time to increase for the next year's occupants. The same method of removal as made use of on a previous occasion must be adopted in the removal of the fry to pond number two. Our fishes have now grown out of their infantile state, and require a more generous supply of food. They have greatly increased in size, and are qualified, in a measure to take care of themselves. The food question presents itself again, and in order to promote the growth of the fishes as rapidly as is consistent with their health, the supply should be abundant, cheap, and readily obtained. Hitherto the hearts and kidneys of slaughtered animals and the larvæ of flies have been staples of supply, but now their rapidly increasing wants exceed our ability to obtain those varieties of food; hence we must have recourse to such kinds as are more easily procured and less expensive withal. There are many substances at this stage of growth well adapted to their voracious appetites—for they do not seem to object to almost any kind of animal food, however coarse in quality, only so that it is reduced to such particles as are adapted to the size of their gullets. The lungs or lights of all slaughtered animals fill the bill in all respects, and when properly chopped are eaten with avidity. An abundance of those may easily be obtained, especially if fish farms are near large cities. These articles may be very easily reduced by passing them through a common sausage-cutter, the kind in which the knives are stationary, and the meat is forced against them by pegs on the cylinder, as those cutters having knives placed on the cylinders do not cut well, but disappoint the farmer, and render this operation extremely vexatious—a fact worth remembering. In those locations where fish farms are supplied with abundance of water, and the supply source being elevated, a convenient power may be constructed by the use of an

over-shot wheel, thus enabling the farmer to construct a convenient meat-house, when the labor of chopping meats may be greatly abridged. In preparing food for the fishes for the second pond, the *chopped meat* should be passed through the cutter the second time, for the reason that young fishes are extremely liable to become choked if the food is too coarse. Chopped lights when thrown into the ponds do not sink, and if the particles are not immediately seized, they float about until they are subsequently eaten by the more greedy of the fishes, until the feeding is all consumed. As in the case of the solid meats, which immediately sink, the lights do not contaminate the water of the ponds. When fish farms are located near fresh water or marine fisheries, the offal may be obtained and utilized into excellent food for trout. Where curing and packing is carried on, large quantities of the viscera or intestines may be procured, which make excellent food when thoroughly reduced by the chopper. Animal food is what is required, and that which is best and can be most cheaply obtained will show the greatest margin of profits to the pisciculturist. It requires from three to four years to perfect merchantable trout, and if they are fed during this period upon expensive food and sold for a dollar a pound, breeding of trout is not a paying business.

From the time the young fry first require food until the period of marketing, though reaching only a pound in weight, individually a fish requires more food than almost any other animal. In feeding a stock of fishes whose aggregate weight, by estimate, equals a ton, fifty pounds a week will be required, fed in equal proportions every other day. If coarse, uncommercial fishes can be obtained cheaply, they make excellent food for trout when passed through the chopper. It is profitable to breed fishes and feed them while small to trout; indeed, some fish culturists count this kind of food as cheap, or cheaper, than any the farmer can employ. The fish farmer can stimulate the growth of his fishes by the use of a proper quantity of food, as well as the stock grower can perfect his meat stock for market. The size that trout can be made to attain at adult age wholly depends upon the amount of food given. As a rule, other things being equal, a trout three years old will weigh a pound; while trout occupying waters that afford but little food, and are poorly fed, will appear as lank and poor as the the runts and stuntlings of an unthrifty stock farmer. Many arguments might be used to prove that domesticated trout will thrive only by the same generous supply of food that the pets of the stall require to perfect those stately figures that commend them at once to the dealer.

A well-fed trout of adult age is one of the most beautiful creatures in his native element that can be found throughout all the groups of animated nature. With generous feeding trout will more than double their weight in a single season. It so falls out, however, that among a large number of fishes there are unthrifty ones, in spite of the most generous feeding.

Trout will not increase as rapidly after three or four years of age as before; hence, if bred for the market, it is greatly to the advantage of the farmer to dispose of them when they have reached perfection. It is considered by all trout culturists that the rate of increase diminishes with age; therefore, after trout have reached the point of excellence known to dealers—marketing should at once begin in the proper season, when their fish is most delicious. While fish culture is yet in its infancy, fish farming may pay better dividends by furnishing stock for new farms in ava or small fry. A female of one pound weight will produce a thousand eggs, which will sell very readily for five dollars. A thousand fry, as soon as the sacs are absorbed, will command from eight to ten dollars. While fish stock is so valuable, to sell parent fishes for one dollar a pound would truly exemplify the adage—"destroying the goose that lays the golden egg." Trout often spawn at the end of the second year, and the product of ava is quite equal to that obtained from older fishes. It will be seen that the profits of trout culture are not so distant of attainment as those of many other industrial pursuits, founded upon capital and labor. What has been written regarding the management of trout two years old applies as well to three years old, except in so far as quantity of food is concerned. Of course up to three years of age there should be an increase of food in the ratio of the ability of the fishes. In tracing this art down the lapsing centuries from a remote period, and from the discovery of Dona Pinchon in 1620, through a period of more than two hundred and fifty years, we believe that fish culture under modern auspices is capable of being expanded into an industry of vast proportions. It was long since declared that the city of Amsterdam was built upon *herring bones*, and if it is not a fact literally, the saying symbolizes the fishing power of Holland, and also illustrates the value of a single crop of the vast "harvests of the sea," which furnish so large a part of the animal food consumed by the human family. Upon a continent so splendidly watered as ours, what a vast field is presented for the exercise of this great and valuable discovery. By a judicious application of the art, our thousand crystal lakes and rivers may be made to teem with immense quantities of food for the millions who now dwell here and the duplicate millions who are to succeed them. We can see in our mind's eye that private enterprise will soon occupy many of the available sites for fish farms all over our country, and under State and National auspices our now barren streams will soon be made to teem with every available species of food fishes—both indigenous and foreign—a grand supplement to human subsistence derived from the soil.

NALMIN E. BALLOU, M. D.

WOODWARD'S CALIFORNIA AQUARIUM.

SAN FRANCISCO, Feb. 28th.

EDITOR FOREST AND STREAM.

The fine Aquarium Exhibition which Mr. Woodward is now making at his Gardens on Mission Street, 14th and 15th Streets, S. F., for the benefit of scientific men and the public generally, consists of sixteen free-stone tanks, with plate-glass fronts, arranged on either side of a spacious hall, constructed in imitation of a subterranean grotto, faintly illuminated by the light which is thrown from above upon the surface of the water in the tanks, and rendering every movement of the finny captives perfectly distinct to the observer. The most perfect exhibition possible is thus obtained, and it is difficult to describe the novelty and the surpassing interest of the sight.

The work of stocking such an aquarium is a large one and some of the tanks are still empty; but enough is to be seen to satisfy every one. Both salt and fresh water fish are shown, each in its appropriate element. The tank containing the crabs, craw-fish, and lobsters attract the most attention. These queer animals can be seen in their grotesquences, crawling and creeping about, now upon the gravelly bottom, and now climbing in their awkward manner up the side of the rough stones, piling themselves upon one another, and sometimes bracing themselves up against the glass front as though to take a leisurely view of their curious observer on the outside. There are scavengers which eat up the filth and decaying matter, the presence of which are so deleterious to the members of the finny tribes. Perhaps, the most curious of all is the tank containing the sea anemones, which look so much like plants, and which, in fact, form the connecting link between the flowery kingdom and active marine life. These anemones are in reality animals. If a morsel of fresh meat or fish is dropped in the centre of one of these beautiful floral crowns, their countless tentacular will instantly close upon it, and convey it to the capacious mouth around which they play, waiting for the chance morsel which may come in their way. After this movement the florescense will again expand, and nothing will be seen of the food.

Several small sharks are seen disporting themselves in one of these tanks in company with some "devil fish'—not those of the Victor Hugo stripe, however. Several other queer-looking finny curiosities are also keeping quiet company with the sharks, the usually sharpened appetite of the latter being probably subdued by the abundance of food furnished them by their generous proprietor—for everybody in this city knows Mr. Woodward is a generous provider, whether for man or animal.

A great natural curiosity lately added to this aquarium is worth explaining to our many readers. This is a formation or junction of animal, mineral, and vegetable matter. The animal is a species of mussel, or clam, probably of the species of Pholas (*Pholas dactylus*), a bivalve. These little creatures make caves in various kinds of matter, as wood, chalk, limestone, or other hard substances, including shells of the common oyster—some selecting one and some the other—but all selecting a hiding place. The mode by which these pholades make these cavities has never been satisfactorily explained. Some think it is done by the sharp edges of their shells, and others suppose they are aided by some solvent acid.

The vegetable connected with this remarkable union of materials is evidently analga; and we believe it is a species of a large class of plants called *Oscillatoria*, found generally on sea rocks, or any substance at the bottom, whether it be oysters, coral, or stones of any kind. The mineral matter attached to this curiosity of nature has some part of it the appearance of bone, and another portion appears to be shell of some kind. It has the marks of the oyster. Altogether, this attraction and wonderful specimen of animal abode, in the shape of a small cave or cavern, for its evidently living inhabitant, in both a vegetable and mineral material, rivets very closely the attention of the visitor to the inmate of the hollow so ingeniously excavated, which is seen to open and shut its shell-doors, no doubt for the purpose of feeding and nourishment. It is indeed a very snug and secure domicile. Whether it can emerge from it is doubtful; but perhaps it has grown too large for the opening, which is made in its more youthful stage or condition of life. This curiosity hangs suspended by a string in one of the apartments of the aquarium of these most-deservedly popular grounds, gardens and cabinets. An aquarium which is equal to most of those now established in America and Europe, and only a little inferior to that lately established in New York City, and Brighton in England; and certainly having no rival west of the Rocky Mountains. It is continually supplied with new and splendid specimens from both our fresh and salt waters, and is a never-failing object of attraction to the people of the Pacific coast.

But I have no time to allude in detail to the rich and rare treat here presented to the curious, and would close this notice by remarking, that this interesting exhibition of animated nature has been devised and carried forward to its present success under the especial supervision of Mr. Charles Schumann, who, at Mr. Woodward's instigation, has recently visited all the principal aquariums of Europe to study their models and management, in order to leave nothing undone to make this a success in every particular.

O. S.

"MISSING," PLANTING FRY, ETC

EDITOR FOREST AND STREAM.

In my short article upon planting fry, on page 81, issue of March 15th, about midway of the article appears the word "Missing." It was not in my manuscript, and it destroys the sense of the article.

Since writing that article I have additional convincing proof of the propriety of "turning out" young fry as soon as the "sac" is absorbed. I received several thousand from Mr. Thompson in November last, and temporarily placed them in a spawning race. By an accident the race became overflowed, and over a thousand of the fry were washed into the small stream below. During the past week we have been ditching the low land through which the stream passes, and turning the stream into the ditches. In the deep holes we found some of the salmon about the size of our yearling brook-trout, or several times larger than salmon of the same lot, which are yet "kept up," and well fed.

MILTON P. PEIRCE.

Aquadale Ponds, Wenonah, N. J., March 26, 1877.

TROUT CULTURE IN MICHIGAN.—Mr. James Anthony, of Escanaba, Michigan, sends the following information:

"Mr. Young, seven miles from here, at Hye Landing, commenced trout raising last spring, and has now 500 large trout, 10,000 fry, and about 600 that have commenced feeding. He has three pairs of twins. Five miles up Whitefish River, and twenty-five miles from here, Mr. E. Richmond has about 3,000 large trout; and at Trout Lake, forty miles from here, at the head of Whitefish River, Mr. J. Day has over 4,000 trout, weighing from a half to four pounds apiece.

MADISON, Ga., March 27, 1877.

EDITOR FOREST AND STREAM.

I am deeply interested in all that pertains to fish, have been experimenting with fish and ponds for seven years; have received and hatched salmon-trout eggs donated by Seth Green; have carried black bass from the Schuylkill River and gold-fish from Philadelphia, and now have three or four acres in eight separate ponds, ranging up to ten feet in depth, well stocked with different varieties of the finny tribe. I am occasionally charged with having "fish fever," and am free to admit that my ponds are more attractive to me than stock yard, poultry yard, or even the well-laden fruit orchard.

If you think an item occasionally on failures and successes in my experiments would interest any readers of FOREST AND STREAM, I will cheerfully contribute an occasional mite.

E. H.

[It would afford us much satisfaction to hear from our correspondent at any time.—ED. F. AND S.].

CARP AU BLEU.—The following recipe for cooking carp is taken from a book dated 1788, written by a man named Briggs, *chef de cuisine* at the Temple Coffee-House. Carp au Bleu: Take a brace of carp (alive) and gut them, but neither scale nor wash them. Tie them to a fish drainer, and put them in a fish-kettle. Pour boiling vinegar over them till they are blue (or you may hold them down in the fish-kettle with two forks, and another person pour the vinegar over them); then put in a quart of boiling water, a handful of salt, a stick of horse-radish cut in slices, and boil them gently for twenty minutes. Fold a napkin and put it in the dish; put them on the napkin, and garnish with parsley. Boil half-a-pint of cream, grate some horse-radish in, and sweeten it with sugar for sauce in a boat. Be sure to send them up hot.

Natural History

A STRANGE CALIFORNIA FISH.—Mr. Throckmorton, one of the State Fish Commissioners, has presented to the California Academy of Sciences a specimen of fish caught in the salt marshes in Marin County. The fish looks like an ordinary "bull-head." Its peculiarity consists in its mode of life. Some of Mr. Throckmorton's land beyond Lime Point is ordinary marsh land, and he several times observed Chinamen at work at low tide, with shovels, apparently digging into the banks of the little creeks. Last week he went down to see what they were about, and was surprised to have a Chinaman answer his question by saying he was "fishing." Fishing with a shovel was a new experience to Mr. Throckmorton, although he has been for many years an enthusiastic sportsman. On examination he found that the bank showed numerous round holes at about the half-tide mark, and the Chinaman took the shovel, sliced off some of the bank, and hauled several fish from one of the holes.

The holes are similar to those made by swallows, and are in such a position that the entrance is under water about half the time. The tide rises here about six feet, and the mouths of the holes are about three feet below high-water mark. They go straight into the bank a short distance and then turn down, so that when the tide falls below them they are still filled with water, although the entrance may be two or three feet above the water at low tide. They seem to have more of the habits of an eel than an ordinary fish, and the skin is also eel-like. Mr. Throckmorton says the flavor of the meat is also similar to an eel. The Chinese laborers gather great quantities of them at low tide. A fish living in a hole in the ground like a squirrel is something new here we believe, nor do we recollect of their having been found elsewhere.—*Pacific Life.*

DISTRIBUTION OF ANIMALS BY SWIMMING.

WAREHAM, MASS., *March 13th.*

EDITOR OF FOREST AND STREAM.

Harper's for March contains an article under the above caption, by S. S. Conant, who claims that no mammals, quoting the bear, deer, jagnar, pigs, squirrels, rats, etc., can traverse the water or swim over twenty miles, and as I claim to be reasonably friendly to our animal kingdom, I propose to stand by and speak in their behalf in matters of knowledge pertaining to the sagacity and endurance of the race.

A journal kept by Capt. H. C. Murdock, of the whaling ship Nassau, of New Bedford, reads, "June 18th, 1857. Shot a Polar bear and her cub twenty-two miles from Sea-Horse Island, Arctic Ocean. On the 25th shot an old bear ninety-five miles from land; when discovered was making for an iceberg, distance seventeen miles, which was stretched across the northern portion of the Arctic Ocean. The bear bore evidence of a long voyage. His carcass when dressed weighed over nine hundred pounds. One of his forepaws more than covered a provision beef-barrel."

Captain Murdock says he never captured a bear on the land; thinks there is no danger on the sea if you don't let brain '*get his foot in your boat.*" It will be seen that Captain Murdock captured three Polar bears in one week, and, for aught I know, it was not much of a season for bears either, and the distance from the land from which they are found, shows conclusively that mammals (at least bears) can swim more than twenty miles on one water excursion. In due season I will say a word about deers, foxes, rabbits, the duck family, partridge and quails, brook and salmon trout, black bass, pickerel, our bluefish, bass, etc., aquatic sports, embracing yachting and rowing. I venture the assertion, that in the diversity of sporting advantages contributed by nature, we are unsurpassed by any locality from Cape May to the eastern shores of Maine.

CYRUS LISCUM.

[Our correspondent has been misled by a newspaper cutting. The article in *Harper's* was not by S. S. Conant, but was taken from Mr. Wallace's recently published work, "The Geographical Distribution of Animals," chap. ii. p. 13. The quotations referred to land mammals, and of course did not include the white bear, which is only a little less at home in the water than the seal.—Ed.]

NOMENCLATURE.

MEXICO, Oswego Co., March 5, 1877.

EDITOR FOREST AND STREAM.

In your issue of March 1st I notice that "F. E. G.," under "Bag and Gun," speaks of having seen and procured a pair of "English (?) snipe" in Orange County. Right here, I would like to speak of an error which many of our sportsmen frequently commit. Either from ignorance or carelessness, they neglect to call *birds* by their proper names. It is well-known that the *true* English snipe is not a resident of this country, and only a rare visitor; and probably your correspondent referred to the American or Wilson's snipe (*Gallinago wilsonii*), which is so universally miscalled "English." I have known good sportsmen to call the white-winged surf duck (*Anthya fusca*) the "American black duck;" when there is about as much resemblance between the two birds as between the mallard and the American *coot!* I have also heard people apply the name of *woodcock* to the golden-winged woodpecker (*Colaptes auratus*). I have often thought that if the birds could talk, they would loudly protest against being called by names which do not

belong to them; and of being attributed to families of the general class *aves* of which they are not members. I do not believe that more than one-half of the so-called sportsmen, or those who are constantly handling the gun, know the names of many of the birds they shoot. At least, I have observed such to be the case. Any member of the feather tribe possessing webbed feet they call a *duck*, and those having slender mandibles and legs are called *snipe*, and so on through the list. Now, a little care and observation would remedy all this; and I maintain that it is the duty of every collector or hunter to ascertain the true name of any species that is new to him, or about which he has any doubts. To be sure, many birds of the same species differ in color and warblings at different times of the year, according to age, sex, etc., which tends to mislead, but the main features and distinctive characteristics remain the same, and a careful examination cannot fail to establish the proper name of any species. This fault is due probably in a great degree to the fact, that we are apt to accept the common or vulgar names of birds and other animals, rather than those laid down in the books. For instance, the buffle-headed duck is often called the "butter-ball," the Carolina grebe, the "hell-diver," the ruffed grouse, the "partridge," etc., etc. But it lies in your power, Mr. Editor, to correct this evil through the medium of your paper; and I have not spoken of it to criticise, but only as a hint to your readers. Meanwhile, believe me ever your well-wisher, and may you meet with the success you so richly deserve. JOHN A. SAVERANCE.

CROW BLACKBIRDS EAT FISH.

PHILADELPHIA, Pa., February 23, 1877.

EDITOR FOREST AND STREAM.

Many of your readers may be surprised to learn that the crow blackbirds (*Quiscalus purpureus*) eat fish, and that they also catch them. Last winter, when I was hiding among the reeds on the shore of the St. John's River, near Lake Jessup in Florida, with the expectation of shooting some ducks, I observed a commotion among the crow blackbirds in the vicinity. They were congregating in great numbers around a pond that communicated with the river near the place where I was sitting. I suspected from their excited behavior that "something was up"; that some unusual adventure was soon to occur. They were reinforced by frequent additions to their number. Their resplendent feathers reflected in diversified colors the rays of the post meridian sun, for, be it known, that the plumage of these birds in the semi-tropical atmosphere of Florida is pre-eminently more brilliant than in the comparatively rigorous climate of the North. I soon entered with spirit into the circumstances of the occasion, and watched the course of "ornithological events." Every accompaniment asserted the poetry of the scene:

> 'Twas peaceful and serene—the day was fair;
> I quaffed the fragrance of the balmy air.
> The birds, with feathers puffed, strut proudly 'round—
> With eyes expectant they survey the ground;
> They rummage o'er the shore, and keenly pry,
> Then scan the water with a crafty eye.

Just then a great splash was heard in the water that startled the birds, but instead of flying away in alarm they made a stampede for the place from which the noise proceeded, and crowded the shore in its vicinity. Before I could comprehend the significance of this performance another splash was made on the other side of the pond, and away scampered the birds to the same place, and the mystery was soon elucidated.

The large bass, often called trout, in the fresh waters of Florida, being a voracious fish, cause great terror and consternation to the small fry. These frequent the shoal water near the margins of the ponds and creeks connected with the St. John's River, as a place of refuge and fancied security from the attacks of their dreaded foe—the bass. The latter are shrewd enough to learn the habits of their favorite food, and pursue them into the shoal water. When they make a charge at their prey they usually spring partly out out of the water, making a great splash and noise. At the same time the small fry jump out of the water in alarm, in their efforts to escape, and many of them fall on the shore. But they find the "fire" just as uncomfortable as the "frying-pan," as the blackbirds, being on the lookout for the assault of the bass, pounce upon the unfortunate small fish and gobble them up before they are able to scramble back into the water. This peformance was repeated many times, and was still proceeding when I took up my departure. On one occasion I examined the stomach of one of these bass in order to ascertain what he had taken for breakfast. In it I found a rat, that had evidently been imprisoned only a short time. J. W.

THE WOODCOCK IN FLORIDA.

JACKSONVILLE, March 15th.

EDITOR FOREST AND STREAM.

I received, on the 9th of this month, a brood of woodcock, four in number, which had, evidently, but just left the shell. They were taken in low pine woods, within a mile of this city. I do not ever remember having heard that the woodcock bred south of Virginia, and I believe that this is an entirely different species, which does not migrate.

R. D. HOYT.

[Our readers will remember that, a short time since, our correspondent, Mr. Geo. A. Boardman, reported woodcock breeding in Florida, and now Mr. Hoyt gives us another instance of this unusual occurrence. We noticed in February a remarkable flight of woodcock, seen about Charleston, S. C., at which time great numbers were killed by the gunners of that city during the two days of their stay; a little later hundreds were killed about St. Augustine, Fla., where the species had seldom been seen before. It looks as if the extreme severity of the earlier part of the winter had driven the woodcock far south of their usual range, and some of them are evidently breeding a long way to the south of their customary summer homes.—ED.]

SAGACITY OF A PICKEREL.

A few years ago I was with a friend fishing from a large rock by the side of a pond; the rock set partly out in the water, so that we could see the bank on either side. About three rods to our right a dead or leafless bush hung out over the water, spreading over several feet of surface, but the branches were not very thick. While standing on the rock we saw a pickerel of near a pound weight leap perpendicularly from the water under the bush just mentioned; its head was toward and some two or three feet from the bank. Thinking it a little curious to see a pickerel act that way in such a place, I let the matter drop for the moment, but very soon we heard a fearful outcry from a frog in the direction of the bush. Looking that way we saw what was apparently our new acquaintance, his whole length out of the water on the bank, with a nice frog in his mouth. Froggie was pleading lustily to be let alone, but *picker* had taken his pick and was deaf to all arguments, and with a gleaming eye for business he flipped about until he reached the water with his dinner safe in his mouth.

Now, the conclusion I came to was this: the pickerel knew, or at least supposed, the frog was near, but did not know the exact point. He therefore sent up his balloon to make observations, and after having done so from above, went to wash in the trenches until his line was all right, when he made a charge and returned victorious. M. C. H.

[A most interesting observation. This shows, too, that frogs when badly frightened or hurt can scream, a fact which has been doubted by some, though long known to careful observers.—ED.]

WHAT BECOMES OF OUR FOREIGN SONG-BIRDS.

EDITOR FOREST AND STREAM.

Your correspondent, Ernest Ingersoll, in a recent number, asks for information respecting the English sky-larks that were let loose on Long Island several years ago. I have some information on this subject which I give with pleasure. I remember asking at the time that those exquisite songsters where in our vicinity; so on a Sunday morning in early May I started to hunt them up. I was successful. I found three in the neighborhood of Prospect Park; two others I met with which seemed to have made their homes in some meadows fringing the Coney Island Road. Those were all mates, as I discovered them only by their song; during the next summer I heard them again and again, in fact, every Sunday. I may say, while they were in song. "Hardy, tough little Britons," I said, "they have been able to withstand the effects of our winter climate." But in the fall of this second year I ran across in my Sunday rambles another of our foreign importations from Prussia, or Poland. He had been out for a day's shooting, and to my question, "What luck?" he showed me the contents of his game bag. There were several robins, one cat-bird, a number of our beautiful gold-finches (of the yellow-bird), blue birds, and among the rest, three of my pets—the English sky-lark. If thinking murder is murder, then I did it then and there, for it was the wish of my heart to do the deed. This must have been seven or eight years ago. I have never seen any of them since, though I have looked for them very perseveringly till last summer. It was on the Jamaica plank-road near the toll-gate. The sun was near its setting, and the "daring warbler" had filled the air with its melody. I sat on a rock by the way-side and watched him as—

> In the golden lightning
> Of the setting sun,
> O'er which clouds are bright'ning,
> He did float and run
> Like an embodied dream whose joy has just begun."

Now, I have an idea that all those birds, with the exception perhaps of one, who is now solitary and alone, have been destroyed by our city sportsmen, and it will be entirely useless making any more importations until we have not only a stringent law on the subject, but that it shall be faithfully and mercilessly carried out. I could fill up half of your paper with my Sunday experiences on this subject—the the reckless, wicked slaughter of our beautiful song-birds.

W. WILLICOTT.

Brooklyn, N. Y., March 8, 1877.

ANTIQUITIES OF LAKE PEPIN.

EDITOR FOREST AND STREAM.

Believing that a great number of your readers are interested in ethnology, I desire very briefly to call their attention to the works of the mound builders in this locality. First, allow me to say that I have—years ago—published several papers relating to these works, but as the subject is every day becoming more and more a subject of research and investigation, the matter bears a little repetition and revision. The valley of this lake, on the west or Minnesota side, is eight miles long, and averages about three in width. On this plat there were four regularly constructed cities of the mound builders. These cities were one, three, and two miles apart. Two of them were laid out and constructed with great regularity, the streets and houses being equally distant from each other. These four towns were connected by regular lines of mounds, which made, as we may say, a continous city eight miles long by one and a half miles wide. Nor is this all, for in the rear, one-half mile back, there were a continous line of out posts or fortifications, which no doubt were for the express purpose of protecting the settlements from invasion. Where there were natural passes to the town the fortifications are increased in number and size—some long with depressed inner-sides, others very large and perfectly round. But I cannot claim space to describe specifically the various mounds, but will venture to speak of only one in particular. One, a very large mound, situated in the centre of one of these cities, was the only one in this collection that contained human remains, and these in a very imperfect sate of preservation. Another large mound, situated little in the rear of the others, I believe to have been their pottery, or the place where their pottery was manufactured. The ground for many rods around was literally covered with fragments of pottery. When the mound was leveled I watched every shovelful of the earth, but nothing was found until the floor was reached, and here again were quantities of fragments of pottery together with a large, flat stone, worn smooth on the upper side. I believe this to be the stone on which they ground the material for their ware, which consisted of a sort of clay, marl, and powdered clam shells. Pieces of the latter were everywhere to be seen.

The collection of mounds of which I now speak have all been removed or leveled, and the town of Lake City is built on the site. But fortunately I made a diagram of them while they were yet undisturbed.

I am led to believe that this great city was the chief metropolis of the mound builders of the Northwest, for so extensive a collection is not, I believe, found elsewhere in the United States.

The relics thus far obtained are but few; they consist of stone axes, knives, spear and arrow-heads, mortars, war club heads, one copper hatchet, numerous fragments of pottery, and parts of human skeletons. These are all preserved in my collection. Now, having called attention to this remarkable city of mounds and given a slight description of it, my purpose is accomplished. My researches commenced twenty years ago and are not yet completed, and I hope ere long to give to the scientific world an elaborate description of the locality, together with theories and speculations.

DR. D. C. ESTES.

THE OCCURRENCE OF THE BLACK RAIL IN MASSACHUSETTS.

EDITOR FOREST AND STREAM:

Under the above heading in FOREST AND STREAM, February 22d, page 33, your contributor asks through your columns information relating to the Black Rail (*P. jamaicensis*) and its occurrence in Massachusetts for the benefit of *Ornithological Science*.

I will therefore proceed to give you, as it may appear, a very singular account relating to the "Black Rail," for the benefit of the Nuttall Club, and more especially, perhaps, of our mutual friend, F. G. B About September 20th, or during the latter part of September, 1873 or 1874, I was passing from Horticultural Hall, in Tremont Street, southerly, one Saturday, between 12 and 1 o'clock P. M., wind S. W. (blowing about 20 miles per hour), equally with rain, umbrella fully set and spread, and when near Winter Street, opposite the Common, I was surprised by the sudden darting of a strange bird in front of the stores, endeavoring to clear its way from the multitude of passers on the side-walk at that hour. It was evidently a mistake that this bird had made, as he rounded over a large plate of glass in his *flight* or *fright*. I took in the situation, and gave my umbrella a lift and a quick turn, and took him, much to my surprise at my success, and then with some difficulty secured this *rara avis* in the braces of the umbrella. I soon had the bird in my hand clean and smooth—("no salt used"), and without any apparent injury to bird or feathers, judging by the way he would peck my hand with that strong beak. I carefully held my bird on my way, though those long yellow legs would strike out to clear the way from their confinement. I had never seen the same kind of a bird before, *though, to some extent*, I have been a constant observer. The shining black plumage, the short strong beak and sparkling eye, with those long yellow legs, satisfied me that he(?) was no "commonor," and he appeared as if he could stand a race with the best of them, *as I have since read that the rail could go it, in and out, in your columns.*

The rare bird was taken to the store, and the singular mode of capture in the middle of the day was freely discussed. No name could be obtained, only that he must be a game bird (very rare) of some kind. Well, I posted to the bird store of Brewster, then on Washington Street, opposite Boylston, and caged our bird for a name. The rare points were soon shown, and in the cage he would lose no chance to use those yellow legs. The name was given satisfactory at the time, as "rail," though no definite variety or species was mentioned. By his plumage being black, and other points mentioned by F. C. B., I suppose it may be the same variety, and if our friends are in any way pleased with this report we are most happy to have offered what we know about the "rail."

Our bird was let loose on the Boston Common in a day or two to pursue his migratory flight, and not kept to adorn the student's case or any collection! D. T. CURTIS.

YELLOW-POOL WOOD-WARBLER (*Dendroica aestiva.*)

PHILADELPHIA March, 1877.

EDITOR FOREST AND STREAM:

This sprightly and favorite warbler arrives here about the first week in May; it excels most other warblers in its good qualities, the sweetness of its song. Its plumage is quite delicate, which is displayed in two colors; the most predominant is of a deep, rich yellow, striped down the breast with delicate light brown, eyes large and black, it measures from the end of its beak to the end of tail four and a half inches, and from tip to tip of wings five and a quarter inches. The habits of this feathered minstrel are first noticed about the beginning of May, darting from one twig to another through the swamp willow, busily engaged searching for its insect food, every few moments pouring forth his silvery song, then darting away to caress his mate. I found one of these cheerful songster's nests on the twelfth of June, 1876, at Red Bank, N. J. The nest was built in a low barberry bush, about three feet from the ground, and was extremely neat; the exterior is formed of silk-weed and lint, and thickly bedded with down of willows and hair. The eggs are four in number, and are laid about the second week in June. Their color is of a creamy white, covered more or less with spots of different shades of brown, thickest at the large end. Dimensions vary from .67 by .50 inch, to .54 by .50 inch. But one brood is raised in this latitude.

GEO. BOUDWIN, Taxidermist.

Woodland, Farm and Garden.

ANNUALS.—In these days, when plants for summer blooming are raised by tens of thousands, and retailed at a price so low that every one may have at least a few Geraniums, or Verbenas, the proper time and method of sowing annuals is not of so much importance as it was some twenty-five years ago. Nevertheless, annuals yet have their value, though possibly they do not stand in the foremost rank. In those days (and very often now) each packet, it mattered not how many hundred or even thousand seeds it contained, was circumscribed to a limit of say twelve to fifteen inches in diameter. Thus, in a space sufficient for three or four plants, hundreds will vegetate, and with what result? None other than the complete annihilation of the true character and development of the plant; its altitude reduced from feet to inches; its blooms individually small, represented by units instead of hundreds. Circumstances such as these are surely more fitted to illustrate an extreme form of the battle of life among plants, than such favorable cultural conditions as should assist rather than retard Nature in the fulfilment of her operations. Such, however, has been and still is the way too frequently followed in dealing with Annuals. It is true, some of the most prominent among them, such as Stocks, Asters, and Marigolds, are even now deemed worthy of an individuality of growth and a sufficiency of space wherein to develop themselves, but there are others equally pretty whose claims have been hitherto wholly ignored. Those who persist in sowing annuals as before described should thin them out when sufficiently large to handle, leaving not over four or five tufts, should thinning out to single plants be too much trouble. When reduced to such close quarters they will fight the battle out among themselves, and one, or perhaps two, will be victors in the strife. The better plan, however, is to raise them in shallow boxes, under shelter of a frame when tender, or quite ex-

posed when hardy, and from these boxes the various little groups can be transferred to the border or flower-bed, selecting, of course, a day succeeding a good fall of rain for the purpose. When bulbs, the majority of which are spring blooming plants, have a special section allotted to their culture, an admirable opportunity presents itself for growing annuals, whereby, in addition to the spring flowers, a summer and fall display may be secured to this otherwise naked and uninteresting portion of the garden. For beds of Lilium lancifolium, or other summer blooming sorts of lilies, they are well employed as an undergrowth, the various sorts being judiciously mixed with regard to color, a fair supply of Mignonette being used to give a neutral tint, giving off its fragrance at all times, the seeds being scattered broadcast over the bed and thinned out in time. They thus not only give an unlimited supply of flowers to cut from, but also act as a mulch during the hot, dry, summer months. One of our most enthusiastic cultivators of Lilies uses the spreading but small rooting Eschscholtzia for this purpose, and finds it answers admirably, more especially among the California Lilies, the cultivation of which seems to be very imperfectly understood. Such annuals as Collinsia, Phlox Drummondi, Nemophila, Limnanthes, Lobel's Catch Fly, and many others, are never seen to such advantage as when self-sown in fall; they survive the winter, and burst into rich, brilliant blossoms in May. While the ground is yet cool, and the influence of the April showers has not yet disappeared, they present a brilliancy in color and a rich depth of green in foliage that is rarely ever attained under the scorching sun of July and August. W. I. D.

THE GLOXINIA.—Gloxinias may be regarded as splendid herbs, and perhaps there are few green-house plants to compare with them for show during the summer and fall months. It is true they are low of stature and without claim to our attention on the score of utility; neither are they possessed of such qualities as are acceptable to those who esteem flowers chiefly when plucked and made up into bouquets. This need not be regretted, however, seeing that they are thereby saved to bloom, to wither, and die on a more exquisite and appropriate setting than in vessels of crystal, silver or gold.

Their culture is simple enough; but to grow them into fine specimens some degree of care and attention is necessary. The varieties chiefly in cultivation are referable to *G. speciosa*, a native of warm South America—and therefore must have the benefit of a warm house if required to be in flower much earlier than midsummer. But as they do not continue a great while in bloom it is better to let them rest until March or April, when they will start with greater vigor and come into flower at a time more likely to remain longer objects of interest than they would if much earlier. About the time they begin to show signs of starting, the roots should be taken from the pots and shaken clear of as much earth as slightly adheres to them, and placed in others so small that they may again be shifted before reaching those in which they are intended to flower. At this stage water should be given sparingly, more especially if the temperature of the house be much below seventy degrees; otherwise the roots will be liable to rot or grow in a most unsatisfactory way. But as the season advances and the constructive energies of the plants attain full play, a more liberal supply should be given. It does not seem desirable at any time, however, to water overhead, but instead to keep a moist atmosphere in the house or frame in which they are grown. By so doing the foliage as well as the flowers will reach their highest state of perfection, and their colors not fade out so soon. The most suitable soil to grow them in is peat, loam, and rotted manure, in about equal proportions, with as much clear sand added as will prevent from baking. All through the growing season, but more especially during the hottest period, shading is of the utmost importance, and few plants derive greater benefit or seem more grateful for such protection than they do.

They can be propagated by taking the leaves off close to the stem, and placing them in sand where they will root in a few weeks; each leaf forming a small tuber at the base, after which they should be put into small pots, there to remain until the following spring. They winter best in a cool, dry place. They can also be successfully raised from seed, and being one of a numerous class of plants subject to variation, strong inducements are thus held out to practice this method even more than has hitherto been done.

As is well-known the flowers of the species (*G. speciosa*) and many of its varieties are borne upon their foot-stalks horizontally, and as the result of cultivation varieties with flowers perfectly erect have now become as common. We remember the time when this "new departure" was first announced, and the novelty, *G. fijiana* placed upon the exhibition table for the first time; and the excitement which stirred the horticultural ranks, as young and old talked of the new comer as something quite out of the line of their expectations; whilst all regarded it as the forerunner of a new race of rare and beautiful varieties. In this they have not been disappointed, as many of the same class have since been obtained, nearly all that could be desired or hoped for both in form and color.

GRAFTING WAX.—For grafting, take four parts of mutton tallow, eight parts of resin, and two parts beeswax. Melt them all together over a slow fire. When thoroughly melted and mingled, pour the mixture off in small quantities into a tub of cold water. As soon as the masses thus poured into the cold water cool down sufficiently to be handled, work precisely in the same manner you would candy, by drawing out and doubling over, until the whole presents a uniform color and becomes hard enough to mould into balls or sticks. This wax, when it is cold, should be quite hard, but it should be tough at any ordinary summer temperature. If, however, it is found that for the climate where it is to be used it is too soft, more resin should be used. Tallow will soften it; resin will harden it, render it more infusible, and beeswax will toughen it. By slightly varying proportions of these ingredients, any desired consistency may be obtained.

ORANGE CULTURE IN FLORIDA.

MANDARIN, Fla., March 12, 1877.

EDITOR FOREST AND STREAM.

Those who set out orange trees the present time are in one respect on the same footing with those who accomplished this say two years ago; for example nursery trees are cheaper; a five-year-old seedling may now be had for what a three-year-old cost two years ago. Even in Florida and in the orange enterprise the reduction in values asserts itself now and then.

In setting out trees it is customary in this vicinity to place them twenty-five feet apart; this gives about seventy trees to the acre, and they will make larger growth than if set nearer together.

When thus transplanted they should be set high in the ground.

"How high do you set trees, Mr. R?"

"Well, I set 'em almost on top of the ground; and after I've set 'em just as high as I dare to, then I raise 'em about two inches more."

My friend R. overstates what he means, and is disposed to be facetious withal. What he means is, that they should be set out so that when in course of time they shall have settled firmly on the ground, they will be no lower than they were before transplanting—if anything, a little higher. Let them be set lower and see what happens; they become victims to the "die back," and the wood louse. The "die back" is a disease in which the trees refuse to grow, and soon wither and die; the wood louse is a small, white bug that prefers the tender bark trees brought to the level of the ground, to decaying stumps and logs, where he is usually found; and he will soon girdle the tree at its base; in these cases the remedy is to hoe the dirt away, or dig under and raise the tree.

The greatest pest to orange trees, however, is the scale insect, of which every grower has had some experience. It is a tiny scale parasite, looking like anything but a live insect; myriads of them on the trunk of a tree make the bark appear but a shade rougher than usual. Scrape a lot off in your hand and they look like dirty dandruff—no legs, no head, tail, wings, no movement apparently, but they can move all over an orange tree and settle down and thrive upon the bitter skins of the oranges. They impair the vigor of the bark of the tree and kill the young twigs. They can, however, in turn, be killed by the usual insect exterminators. The reason they are so great a pest is on account of their number and the extent of their depredations. In your grove of a thousand trees you may have twenty troubled with the "die back" or with the wood louse; these you can attend to with a moderate amount of trouble; but nearly or quite all of the thousand may have the scale insect; and a visit with a scrubbing-brush and pail of carbolic acid water to each of so great a number of trees is a very extensive job which ever way you look at it.

There is a satisfaction in knowing that the winter frost has the redeeming grace of killing these insects, and is the orange grower's best friend in this respect, if in no other. Anxiety and fear for the safety of the fruit during a frost is succeeded when the danger is past by a natural satisfaction in contemplating this benefit conferred, and people say, "what a lot of insects it must have killed." C. D. D.

Game Bag and Gun.

GAME IN SEASON IN APRIL,

Wild duck, geese, brant, &c.

COOKED OUR GOOSE.—We had our "goose cooked" last Tuesday, and a noble feast he made. He was not one of the historical breed that saved Rome, nor yet one of those commonest of birds which are so uncommon common on a common, but a true representation of the host that annually gather at Shinnecock Bay, both autumn and spring—one of those "birds of a feather that flock together," which children read of. It is said that the pinions of the ordinary goose are often used to spread the opinions of another sort; but the pinions of the Shinnecock geese are spread for a different purpose, viz.: to afford sport to the habitues of Wm. Lane's hostelry at Good Ground, and gratification in their bestowal of their birds upon the editors of FOREST AND STREAM. Every one of those gunners who go down to "Bill's" knows how much "more blessed it is to give than to receive;" and the editors of this paper have learned by experience how much more comfortable it is to have their goose brought to them by express than to sit in a blind and shiver until the ill-fated birds are lured within gun-range by the decoys.

We believe that the most generous gunners are usually rewarded with the greatest success; and this accounts for the fact that Lane's guests usually get full bags. Lane himself has usually on hand, we believe, a fair supply of the milk of human kindness, besides fresh cow's milk, fried chicken, pancakes, and soft-shell clams. One of the most frequent visitors to Shinnecock is our friend, Geo. B. Eaton, Esq., whose sobriquet is "Jacobstaff." He finds time to spare from his duties in the Custom House, to go down there; and when he *has* luck, he never fails to remember the poor editor, not knowing what he may come to one of these days. This time he brought us a twelve-pound goose, which was one of thirteen which he killed a day or two before, together with a good bunch of broad-bills. Our friend Thompson, of 301 Broadway, whom our readers well-know, accompanied him and shared his sport. He distinguished himself by making a fine double-shot, and killing a gander with each barrel of his ten-bore gun. These gentlemen report many thousand geese and brant in the bay, but owing to the high tides about the full of the moon it was impossible to lie on the bars, and the birds would not stool well on the meadows. When the tides diminish this week, good shooting is guaranteed.

The Greenville Sportsman's Club of Greenville, Pa., have inaugurated the shooting season by procuring a set of Capt. Bogardus' traps and shooting matches at glass balls. At the first essay, each shooter being allowed twenty balls, one half of the balls were broken; a very fair average. The Secretary of this Club, Mr. M. Hargen Brooks, was recently the recipient of a testimonial from his fellow club members in the shape of a handsome shooting-coat, a slight recognition of his efforts and untiring zeal in behalf of the interests of the Club.

—Isaac McLellan, Esq., who contributed the first article ever published in FOREST AND STREAM, has a very entertaining article in the *Home Journal* of March 28th on "Wild Fowl Shooting" on the coast of Virginia and North Carolina.

—At the annual meeting of the Worcester (Mass.) Sportsman's Club, on March 7th, the following gentlemen were elected officers:

Jerome Marble, President; Geo. B. Buckingham, 1st Vice-President; W. S. Perry, 2d Vice-President; Stedman Clark, Secretary; G. J. Rugg, Treasurer; A. L. Rice, W. H. Cole, C. R. B. Claflin, C. B. Holden, Executive Committee; Marble, Buckingham, Perry, Cole, and Claflin, Pigeon Committee; Clark, Rugg, Rice, and Holden, Rifle Committee.

PENNSYLVANIA.—The Kensington Gunning Club had its regular shoot last week with the following scores:

Magsam, 5; Metzger, 3; Gendele, 3; Holtzscheiter, 6; Houg, 4; Scheuringer, 5; Hapfner, 4; Breyrle, 7; Stees, 4; Steiger, 4; Sheip, 4; Steck, 5; Habting, 3; Guntner, 4; Meige, 7.

In shooting off the ties, Meige won first gold medal, Holtzscheiter second, and Scheuringer the silver medal.

VIRGINIA.—English snipe have arrived in the neighborhood of Petersburg, Virginia, and will be very numerous for two weeks to come at least. Our Perth Amboy correspondent "K." had excellent sport there last week. He reports:

"Geese and ducks have left the James River, bound north. Thousands of ducks have been trapped on the James this winter in pens made of slats, covered with netting and baited with corn. A Mrs. Birchett, near City Point, is making her fortune in this way, sending ducks to the Petersburg and Richmond markets by the cart load; from fifty to two or three hundred at a time. Where is the 'majesty of the law?' Or *is* there *no* law against this sort of thing? Virginian reader, see about it; or, the first thing you know, you will want to sell your duck-gun. There will be 'no use for it.'"

CAPT. BOGARDUS' LAST FEAT.—On Friday evening last a large audience assembled at Gilmore's Garden to witness Capt. Bogardus' effort to surpass his previous record, and break 1,000 glass balls thrown from his new traps in 100 consecutive minutes. To say that he accomplished it would be merely to repeat the opinion of every one who is conversant with the Captain's wonderful powers with the gun, but it was hardly expected that he would surpass as far as he did his previous performance. The whole number of balls were broken in the remarkable time of one hour, seventeen minutes and forty seconds. The usual screen was used, but in addition a calcium light was used, which brought the balls into strong relief against the white background. The first 100 balls were broken in 7 m. 50 sec., but three being missed in that number, and 87 being broken straight. In the next three hundred but two balls in each were missed, and the misses in all amounted to but 28. The last 155 were broken without a miss. The entire 1,028 shots were fired without a rest being taken. The same gun, his now justly celebrated W. & C. Scott & Son premier, which has probably had more shots fired from it than any gun in existence, was used throughout, the barrels being changed fifteen times. One pair of those barrels has now had over twenty thousand shots fired from it, and is as good as when made. We regard this as a wonderful test of endurance on the part of both man and gun, and would suggest that when Capt. Bogardus shoots again he tries one of some other make, American for instance, and let us see whether our guns are not quite as good as those imported.

RHODE ISLAND.—*Providence, March* 31.—We had a shooting match here last Wednesday between Capt. Bogardus and E W. Tinker. Of course the captain won, which he most always does; however, it was a very good match. Mr. Tinker had not much practice on this new breed of pigeons which the captain has invented; but by the time the Captain comes again we hope we can show a better score than the following:

SINGLES.

Bogardus.....	1	1	1	1	1	1	1	1	0	1	1	0	1	1	1	1	1	0	1	1	—17
Tinker.....	1	1	1	0	1	1	1	0	1	0	0	1	1	0	1	1	0	0	1	0	—13

PAIRS.

Bogardus.....	10	10	11	11	10	10	11	11	10	11	11	10	11	10	11	00	11—22
Tinker.....	11	10	10	11	10	10	00	10	10	10	10	00	10	11	10—16

Mr. N. Dexter acted as judge and referee, and Mr. Willian Crandall as trap keeper. The singles were shot from three traps placed ten yards apart with eighteen yards rise, the shooter not knowing which trap was to be sprung; the doubles were shot from two traps, same distance apart and sixteen yards rise. Mr. Bogardus easily won the match which was for ($100) a side.

MOSQUITOES IN MARCH.—A correspondent writes: "On the 23d of March, at the house of a friend at Plainfield N. J., I killed a mosquito. As they are never found in that village except during a week or so of early autumn, I should like to ask a conundrum: Was that mosquito carried over from last season, or was it a spring chicken of 1877?"

[We regret that our correspondent did not send us the dimensions of the bird. It might have been a snipe. We know that they were being anxiously looked for about that time, and as the average Jersey mosquito approximates in size to many of the family of *sculopacidie*, it might have been "one of them." But no! come to think of it, this one did not 'scape—so it must have been a mosquito; probably brought into existence through the medium of a warm sun shining on some stagnant water.—ED.]

—Children are often bothered with itching and chafing. To prevent this in the simplest fashion, use B. T. Babbitt's Toilet Soap, which has recently been put on the market by its well-known manufacturer. Its admirable effects make it the safest and best toilet soap for old and young.—Adv.

UNDOUBTEDLY one of the best and cheapest stocks of Carpetings, Oil-Cloths, Mattings, etc., etc., to be found in the United States is that of Messrs. JOHN H. PRAY, SONS & CO., Washington Street, Boston. I. W. Adams is the sportsman of the firm, and will take special pains to please any of our friends calling upon him, or with any orders sent him. It is a good, reliable house.—*Adv.*

Answers To Correspondents

No Notice Taken of Anonymous Communications

☞A number of anonymous correspondents will understand why their queries are not answered, when they read the lines at the head of this column.

R. M. S., Nelles Corners, Can.—Can I send the FOREST AND STREAM 6 months' lot of them, to you by mail? Will you have them bound for me, and return? Ans. Yes.

CHAS. ROGERS, Philadelphia.—Please inform me where I could obtain country boarding, where there is good gunning and fishing, not more than 120 miles from the city. Ans. At Barnegat, N. J.

T. J. C., Walnut Hill, Ky.—Is there any work on the fresh water aquarium, and what is the price? Ans. Apply to J. W. Fiske, corner Church and Park Place this city.

R. M. P., West Bloomfield, N. Y.—Can live quail be procured in New York now for breeding purposes? If so, please give price, address, etc. Ans. No live quail can be procured in this city now at any price.

C. C. C., New York.—Can you give me a remedy for preventing the strong leather smell of old or new shoes? When wet they become very unpleasant? Ans. It could probably be obviated by a few drops of oil of bergamot in the blacking used.

C. W. F., New York.—What quantity is considered a fair load of powder and shot for a 12-bore muzzle-loading gun, say No. 5 or 6 shot? Ans. Much depends upon the weight of the gun. 3½ drs. powder and 1⅛ oz. shot would be an average charge.

FISHERMAN, Columbus, O.—Please state the respective advantages of a tapering, braided silk fishing line (for reel) over one without taper, and oblige. Ans. It certainly delivers the fly better. A whip-lash that did not taper would not be very serviceable.

C. A. S., Shakopee Minnesota.—Are not the rim-fire rifle cartridges as now made considered reliable and suitable for hunting purposes and short-range target practice? Ans. Our experience proves the rim fire cartridge to be as effective and reliable as the central fire.

P. X. L., New York.—Would you be so kind as to let me know, through the next edition of your paper, if Mr. G. de Lendro Macdona is any relation to Allen Macdona, the great horseman, of Ireland? Ans. We do not know.

H. E. K., Dunnville, Wis.—Is it true that a person cannot shoot as far over water, with either a shot-gun or rifle, as over land, and if so, why? Ans. We do not believe that there is any difference. The attraction of gravitation would be the same in both cases.

W. M., Rush, Pa.—What place, in New York, would be the best market for brook trout, and what would be the probable price? Ans. E. G. Blackford, Fulton Market; price, 15 to 75 cents per pound, according to locality where the trout are raised.

E. A. P., Lakeville, Conn.—Can you tell me who is the inventor of the paper patch now used on ride bullets? Ans. The patent is, or was, owned by the Remington Company, but we cannot ascertain the name of the inventor without sending to Washington.

CAP, Pa.—Can you inform me where I can obtain some live ruffed grouse? 2d. Will they live in a coop? 3d. Is it lawful to keep them during closed season for propagation? Ans. 1st. No; not at this season. 2d. Not for any length of time. 3d. Yes.

H. J., New York.—Will you kindly let me know, through your correspondents, if there is any shooting to be had in the Catskill Mountains, and if it is a good camping-out country? Ans. First-rate country to camp out in, but no shooting until fall, when there are plenty of ruffed grouse.

ARF, Bristol, Pa.—Are the Whitney Arms Co., of Whitneyville, Conn., manufacturing breech-loading shot-guns now? Are there many in use? What are their prices? Ans. The only shot-gun now made by the above concern is the single-barrelled "Phœnix," price $16. We have heard them highly spoken of.

P. H. D., New York.—Where can I find the pedigree of Alfred and Moll, of the Marquis of Anglesea's kennel; one of their pups was brought to this country in 1854. Can you tell me by the 12th inst? Ans. Were they setters, pointers, cockers, or pugs? Give us these particulars and we will answer you.

L. R., N. Y.—1st. Do you prefer a pistol grip on a gun? 2d. What time of the year do squirrels breed? 3d. Is a $75 gun considered a good gun—I mean the price of it? Ans. 1st. Having once used a pistol grip, you would probably like it. We prefer the half pistol grip. 2d. In the spring and summer. 3d. Some very good guns are sold for $75.

H., Alton, Ill.—Noticing that you frequently mention number of shot in an ounce, and as it does not agree with the shot used in this section, I would like to know what your standard is. Inclosed find list of the St. Louis Shot Tower Co.'s shot. Ans. We generally take the Tatham shot as a standard. In Mr. H. C. Squires' catalogue you will find the sizes given of all shot manufactured in the United States.

BRUSH, Baltimore.—Where and at what cost can I procure "Stonehenge," "Idstone," "Burgess," American Kennel and Sporting Field, and Laverack's work on "The Setter," spoken of by Mr. Tileston in his article in *Scribner* for April? Ans. "Idstone" can be had of Cassell, Potter & Galpin, this city; price $2.50. "Stonehenge," of Lee & Shepard; price $3.75. "Laverack," of W. Wood; price $3.75. "Burgess," J. B. Ford & Co.; price $4. We can send all. The price of "Dinks, Mayhew & Hutchinson" is $3.

R. W. T., Parkers, Pa.—Do you know how I must proceed to the culture of minnows for bait for fishing parties? How long does it take them to become large enough for bait? Ans. Minnows will thrive under the same conditions which apply to gold-fish. See answer to another correspondent to-day. You can do little else than prepare your pond, place your spawners or full-grown fish into it, and trust to luck.

E. R. S., Anamosa, Iowa.—Can you tell me what is the matter with my pup, a bitch setter, nine months old. Her under-eyelids look very red and inflamed, and her eyes discharge a whitish matter. She has a good appetite and seems all right every other way? Ans. Your dog has probably taken cold. Bathe her eyes with warm milk and water about equal parts of each, using a soft *linen* cloth.

F. N. L., New York.—1st. Can you tell me what kind of fresh-water fishing I can have at Greenwich, Conn., about the month of June or September? 2d. What kind of shooting can I have in the months of September and October? 3d. Can a person enter an amateur athletic meeting when he has rowed for money when a young boy? Ans. 1st. We do not know about the fresh-water fishing, but have an idea that you would not have to go far inland to find some black bass. 2d. Woodcock, quail and ruffed grouse, but not first-class. 3d. No. The rule is very strict in excluding any person who has *ever* competed for money.

G. W. P., New York.—Will you please decide a bet between A. and B? If A. figures on 33 1-3 per cent., how much has he made if he sells $10 worth, and how much money does he lay out for the goods he gets $10 for? Ans. He has made $3.50, and has laid out on the goods $7.50. That is, if he sells goods which cost him $7.50, and realizes 33 1-3 per cent. profit, he has sold $10 worth of goods.

H. D. N., New York.—Is there any room, or hall, or other place in New York, where one may practice "shooting on the wing?" I should like sometimes to freshen myself with a little practice at a gyro, or something of the sort. Ans. Capt. Bogardus is now looking for a place in this city where he can open such an establishment as you describe. When he finds one, it will be duly advertised.

T. B. G., Laurinburg, N. C.—Do you know of a journal that treats of fish culture exclusively? I am interested now in fish culture. Ans. There is no such journal, and none that devotes anything like the space and attention to fish culture that FOREST AND STREAM does. In the last three years and a half we have printed about 400 columns on this subject—equivalent to a book of over 1,200 pages, duodecimo, in "long primer" type—and thirty-six wood-cut illustrations.

J. H. B., Boston.—Please inform me of a good place to go snipe shooting within fifty miles radius of this city. Ans. In the neighborhood of Salem, Cohasset, Marshfield, and Newburyport, there are marshes where snipe shooting is always to be had in the spring. Of course it is impossible for us to particularize, as the shooting varies with each season.

C., Lancaster, Pa.—I have a fine English pointer dog, four years old, well broken, that has commenced to hunt and eat all the eggs about my place. What can I do to break him of it? Ans. We have heard it said, that to boil an egg, and leave it while very hot where the dog can get it, will cure him. We are inclined, however, to believe that the only cure, if there is any, is in the constant and forcible application of a rawhide.

F. W. S., Philadelphia.—Will you kindly inform me the proper way to measure a target for trying a shot gun? Speaking of a 30 inch circle, do you mean in circumference or diameter? and give me what you think the best size and distance to shoot at a target. Ans. A 30-inch target means one measuring in every direction 15 inches from the bull's-eye or centre. A target of this size at 40 yards is generally used in testing guns for pattern.

F. Z., Philadelphia.—Which is the most successful way to fish for pike in a stream say seventy-five (75) yards wide, and the kind of line and bait used? When does the season come in for fishing the same? Ans. Pike fishing is best from July to autumn. The fish can be taken by trolling with a spoon or gang-hook, baited with frog or minnow, or by skittering upon the surface with pole, either from a boat or shore. Their favorite resorts in mid-summer are near lily-pads and weeds.

TAXIDERMIST.—Ans. I notice in "Answers To Correspondents" one Carter, of Philadelphia, inquiring if you knew where you could recommend him to a taxidermist of Philadelphia. You spoke of John Krider, Esq., and myself, but I am sorry to say my name was wrongly spelled. Instead of it being Boudroin, it is Boudwin. My residence is No. 2,568 Frankford Road. By rectifying the mistake you will do me a special favor.

H. M. T., Winterport, Me.—1st. Where can I get a greyhound pup? I want a dog to go with a fox-hound that I have that can catch a fox. 2d. Please let me know the weight and height of fox-terriers of common size, and if they can run down a fox. Ans. 1st. There are some greyhounds of excellent stock advertised in this issue of our paper. 2d. A fox-terrier should weigh about 16 pounds, and be from 9 to 10 inches at the shoulder. They can not run down foxes, their use being for going into drains and holes, to dislodge or kill them.

PSYCHE, Boston.—In what year did Daniel Webster receive the setters "Rake" and "Rachel"? Were they a present from Lord Ashburton? Who, if any one has any of their progeny? Ans. We do not know in what year Rake and Rachel were imported; but as Rake died in 1844, it must have been some two or three years previous to that date. They were said to have been presented to Mr. Webster by the Duke of Gordon. We do not believe that any of their progeny are living, in proof of which we refer you to a long article on those dogs in our issue of March 26, 1874. We have not an unbound copy, or would send it to you.

F. B. P., Frankfort.—Will you oblige by sending me, C. O. D., the best condensed work on the resources, game, etc., of Florida? Also, the best guide map of that State? What, in your opinion, is the best work on the ornithology of North America—that is, illustrated, and giving a neat little description of the habits and locality of each bird? I do not mean an extravagant work, like Audubon's or Wilson's, of course. Ans. Have sent you "Camp Life in Florida," and Attwood's Map. The cheapest and best book on ornithology is the "History of North American Birds," by Baird, Brewer, and Ridgeway; the six volumes are issued at $20 each.

T. E. S., Newport, R. I.—I have two black and tan pups, born March 5th, 1877. They are very small and delicate, and the mother is dead. What would you recommend to feed them on? Ans. Milk diluted with about one-third water, and slightly warmed and sweetened for the present. They will take it from a bottle, or if not yet taught to lap, dip your finger in the milk and then place it to their mouths, and they will soon learn. We have found condensed milk (Borden's) in the proportion of a tablespoonful to a tumbler full of water (warm) answer very well, and it is already sweetened.

BEN, North East, Pa.—Both barrels of my gun occasionally go off at once, when I pull only the forward trigger. The jar from the right appears to discharge the left. Can it be remedied, and, if so, would you trust a common gunsmith to do it? It is a new Scott breech-loader, worth $100. Ans. Any good gunsmith will remedy the trouble in a few minutes. Probably the tumbler in the left lock wants a little filing. We should not hesitate to trust it to a local gunsmith.

SUBSCRIBER, N. Y.—I bought a Scotch cocker bitch last October, and the party I bought her from says he owned her two months. He says she never was in heat while he owned her, and has never been in heat since. I sent her in the country last November to a friend of mine who pretends to know something about dogs, but he cannot tell me the cause of her not coming in heat. She appears to be in good health. Please answer in your next if you know the cause of her not coming in heat, or if anything can be done to bring her in heat? Ans. You do not give the age of your bitch, which has everything to do with the matter. Dinks says that 6 drops of tincture of cantharides will bring a bitch in season.

G. C. P., Harrison, N. Y.—What are the best varieties of flies for trout and black bass fishing in the vicinity of Rangeley Lake during the last of August and first of September? Ans. Almost any good standard fly will take at Rangeley, if fish are in a feeding mood. A good cast is a silver doctor, for stretcher and change dropper, as case may be. Mr. Hobbs, of Bridgeport, killed his "big fish" (9-pounder) on what Barton, Alexander & Waller call "Long Tom," a very good fly. Silver doctor, long tom, golden pheasant, red and brown hackles, blue jay, scarlet ibis, grizzly king, Dennison white moth, and small salmon flies are all good in September.

L. E. A., Oneida.—1st. Has the law compelling parties owning dams on streams to leave a place in their dams, so that fish can run up the stream, been repealed? We are seven miles from the Oneida Lake, on the Oneida Creek, and formerly had good fishing in pike, pickerel, and bass. There are two dams, which prevent the fish from running up, consequently the stream is fished dry above the dams. Some lawyers here say it has been repealed; others, that it has not. 2d. Can you give me the name of a good firm for changing muzzle to breech-loaders? Ans. 1st. The section does not now appear in the game laws, and we thought that it had been repealed, but Hon. R. B. Roosevelt says to the contrary. Seth Green says that if they would do away with the fish-weirs in the Oswego River, Seneca River, and Oneida Creek, it would do more good than it would to tear the dams all down. 2d. Geo. Hayden, No. 143 Fulton Street, this city.

G. L., East Bay, Mich.—Can the State compel any person to remove his dam or screen on a stream, in order that fish may pass up to benefit his neighbors who live above him, when the party owning the dam also owns the stream, or rather a part of it, and is engaged in the propagation of brook trout thereon, and in order to prevent their escape has to screen the stream above and below? Can the State compel him to erect fishways in order to allow fish to pass up beyond his obstructions, in case he does not see fit to remove them? Ans. The State cannot interfere with legitimate industry on a man's private property, and to open your dam would destroy your trout works. If a stream is navigable for boats, some States could compel the construction of fishways; but such a stream would not be suitable for trout culture.

W. Y. S., Princeton, N. J.—Will you be kind enough to inform me through your "Answers to Correspondents" column whether or not it is well to place a pan of dry salt in a pigeon house? I have lately stocked mine, and one individual informs me that unless the salt is there the birds will desert it as soon as they are let out, and another says that salt is certain death. Ans. There is no danger in giving your pigeons an unlimited amount of salt in any shape, especially if allowed their liberty. If confined, let them have plenty of water. If salt has been kept from them for some time they will eat large quantities, but we have never known it to injure them. "Salt Cat," so-called, is a good substitute, and can be had of most pigeon dealers. It is also fully described in "Moore's Pigeon Book," which can be had for 30 cents. Address *Fancier's Journal*, 39 North Ninth street, Philadelphia.

G. J. W., Philadelphia.—In fishing in deep water with a fly for black bass, do you sink your fly with a small lead, and leave it remain the same as you would in fishing with craw fish for bait? Also, do you use a float, and what size of hook is best? Is a gaudy fly (red) preferable to a dark one, or would you please give me the name or description of the flies you would prefer using in the mountainous regions of Pennsylvania? Also, is a 12 or 13 ounce bamboo rod too heavy for bass fishing? Ans. In fly-fishing you use no float or sinker. The fly should be trailed upon the surface of the water, allowing it to sink occasionally a foot or so. You should have a gut casting line of at least six feet in length. Flies of different colors are used with equal success. Shipley or Krider, or any tackle dealer in Philadelphia, will fit you out. Your rod is not too heavy. The last half a dozen numbers of FOREST AND STREAM contain information as to bass fishing. We can send them to you.

G. N. B., Latrobe.—1st. Will California quail breed in confinement? 2. What would be the proper or best way of keeping them? Would you prefer a cage or pen. 3d. If I turn them out, do you think they would breed this year, and would they stay near the place I put them? 4th. Are they as hardy as our quail, and how would they stand the winters of Pennsylvania? 5th. Where would be the best place to put them out—near a swampy or marshy place, with good feeding-ground in the vicinity, or near the woods? What is best to feed them? Ans. 1st. We do not believe they will breed in confinement. 2d. In a large, roomy cage. 3d. We do not think they would stand the climate. 4th. No. 5th. We do not believe it would be of any use to turn them out. Kept in the house they might thrive for a while. Feed them on buckwheat, or almost any grain. Their natural food consists of seeds of all kinds, grapes, etc.

G. C. S., Montreal.—1st. Would it be possible to take a very light skiff across the portages in the Muskoka district, especially from Coboconk to Eco Lake? 2d. Would the trout fishing be pretty good during August and September? 3d. Please name and explain different modes of capturing (shooting) the deer, and which would be most adaptable to Hollow Lake locality? I have no deer hounds. 4th. Is the Nepigon River played out for trout? 5th. What is meant by the Kennel Register? Do you mean to say that any one writing you, and claiming a name for his dog, that no one has a right to call his dog by same name? Must a dog be pure bred before he can be registered in the stud book or would you take a cross between a water spaniel and a cocker, the dam and sire being pure in both cases? Ans. 1st. Yes. 2d. Best in September. 3d. Fire-hunt them, or "float" them. 4th. By no means. 5th. The Kennel Register is for the registration of pedigrees. A name claimed publicly belongs by courtesy to the person first claiming it. We should not, knowingly, receive the pedigree of a dog bred as you describe.

E. H.—I would like some information about the habits, time and manner of spawning with gold-fish? They seem perfectly at home in my ponds; grow nicely, but I do not know what attention is necessary for increasing the pretty pets? Ans. Use any well, or creek, or river water that is not impregnated with mineral; change the water when the fish come to the top and stay there and breathe part, water and part air. When you change the water take out nearly all, leaving enough for the fish to swim in, and fill the vessel with fresh water. Never take the fish in your hand. If the aquarium needs cleaning make a sort of mosquito netting and take the fish out with it. There are many gold-fish killed by handling. Keep your aquarium clean, so that the water looks as clear as crystal, and watch the fish, and in a little while you will find out whether your fish are all right. Feed them all they will eat and anything they will eat, worms, meat, fish, or fish spawn. Take great care that you take all that they do not eat out of the aquarium. Any decayed meat or vegetables in water has the same effect as fish in water that it does to you in air. If your gold-fish die it is attributable, as a rule, to one of the three causes—handling, starvation, or bad water. We have printed considerable on this subject from Seth Green and others, and have mailed to you the papers containing the information.

D. R. C., North East, Pa.—In reply to my inquiry for a hound to run foxes, hares, and rabbits to the gun, you recommend fox hounds, and state that beagles used for running rabbits would be worthless for running foxes (FOREST AND STREAM, March 22d, 1877). Dog men write me that a fox hound is much too fast to run such game to the gun; that they run the game off in a bee-line away from the shooter; that I want a slow dog, one that will keep up a slow rate and allow the quarry to make numerous doubles, giving the sportsman many opportunities to shoot the game. 1. Would you still hold that I want a fox hound? 2. Can you inform me where I can obtain a pure bred A No. 1 beagle hound? 3. Dr. L. H. Twaddell, West Philadelphia, has no dachshunds for sale. Can you inform me of any other party in this country who has dachshunds? 4. What would you think of a dachshund for my purposes? 6. How many editions of "Liv. Stone's Domesticated Trout" have been published? 7. Do not domesticated trout meet with a ready sale in New York in quantities, and if so, at what price per pound? Ans. 1. Your dog men we hold are wrong. If you want to follow your hounds on horseback or on foot, you want, over an average country, slow dogs, otherwise you could not keep up with them; or, if you want merely to drive a fox to his earth or hole, any kind of a dog that will follow his scent will answer; but if you want to keep a fox going so fast that he has no time to escape in this way, you want a fast dog. 2. There will be numbers on exhibition at the forthcoming N. Y. Bench Show, and you can buy one there. 3. We do not know of any. 4. We do not believe they would answer. What you want is a brace or two of good fox hounds, and a fox terrier or two. 5. We cannot indorse the assertions of the party named in this query. 6. We do not know. 7. Not after the first rush attendant upon the opening of the season, unless they came from Long Island. Fifty cents per pound is the price usually asked for them.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK.

[POST OFFICE BOX 2832.]

Terms, Four Dollars a Year, Strictly in Advance.

Twenty-five per cent. off for Clubs of Three or more.

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line; outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

*** Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, APRIL 5, 1877.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

☞ Trade supplied by American News Company.

CHARLES HALLOCK,
Editor and Business Manager.

DON'T YOU FORGET IT.

—On the 1st of May next the office of FOREST AND STREAM will be removed back to its original quarters, 103 Fulton Street.

OUR ADVERTISEMENTS.—Readers will do well to scan our advertising columns at this spring season, when winter advertisements disappear, to be replaced by others which appeal to summer requirements. A great variety of objects are here presented. Many business men are under the impression that FOREST AND STREAM is a good advertising medium only for sportsmen's goods—guns, dogs, fishing-tackle, and the like—but a casual glance at its columns will discover that no less than thirty-two distinct interests are represented. We enumerate boats, boots, books, clothing, carpets, disinfectants, dogs, fishing-tackle, fish culture, farms, guns, gymnasia, horses, horticulture, houses, hotels, house-furnishing, insurance, jewelry, lanterns, liquors, music, medicines, natural history, poultry, periodicals, rubber goods, railroads, soap, steamships, steam yachts, taxidermy, tobacco, and watches. These general heads embrace a great many kindred branches.

Those who have tried us generally hasten to assure us of the very material service we render; and the very best testimony afforded lies in the fact that many of our advertisers have stuck to us from the beginning of our publication. They assert that this is as good a general advertising medium as any in the country. Let the incredulous try it once and see for themselves.

—The new and elegant steamer C. H. Northam takes her place on Monday, April 2d, on the line between New York and New Haven, leaving Peck Slip at 3 P.M. This will be welcome news to travellers, as this steamer has always been a favorite.

Nine vessels of the Long Island Fishing fleet which sailed for the Newfoundland Banks last November are missing and supposed to be lost. Their names are the John T. Ryder, S. G. Noble, Agnes Saunders, Fannie Eves, Emma Hurd, J. P. Crook, Celia Bernard, W. F. Merckle, and E. D. Baldwin.

—There is so much game in California, and so many gunners shooting around, that the *Pacific Life* prints each week a regular Department of Hunting Casualties.

JAM SATIS.

"Jam satis nivis atque dirae grandinis Misit Pater."

THE morning breaks clear and unclouded. A million radiant gems glance and sparkle from each blade and budding leaf. The air is soft and balmy, the fragrant odor of woods and fields comes full and fresh to the nostril. Nature again assumes her most bewitching attire. Can romance, or poetry, or art, or painting ever adequately express to imagination or senses the soft beauties of an early spring morning in the country? How we pity the lot of those who are debarred from its pleasures! Those who have but rarely or but once experienced an early morning tramp at such a time, should hold it as the greenest, freshest spot upon the tablet of their memory, until the opportunity shall arise for a second enjoyment of this delightful privilege.

But to the ardent and enthusiastic admirer of the great works of the Creator alone can these scenes come back with all the fervor and veneration of idolatry.

We shoulder our collecting gun and start out. How bracing the air is! It seems as though there were no limit to our physical capabilities. It gives an additional elasticity to the step, a clearer tone to the voice. It seems to throw a sweeter music into the metallic tones of the woodthrush, wafted by the gentle zephyr from the valley. How sweet falls the musical cadence of the favorite little blue bird, as he carols forth his song to the new-found spouse in the orchard near by. We descend the slope. The full-toned note of the red-winged blackbird is heard far below in the cattails, where he and his mate are engaged in the construction of their water-locked home. We enter the woods with their tall chestnuts and antlered oaks. The distant bark of the grey squirrel, too shy to show himself, and the incessant chattering of his impudent little congener, the red cousin, as he chafes in furious tones at the intrusion, are the sounds that first strike the ear. Now and then a golden-winged woodpecker sounds his hammering through the vistas of the forest, as he sends the chips flying right and left from the door of his future abode; and perchance a woodcock may startle you as he whistles up from under your very feet. These are the voices of the woods, links of a golden chain which serve to bind us nearer and closer to nature and her God. The remembrance of such scenes is truly delightful, and the anticipation of like pleasures to come again makes life on dark days bright.

We have seated ourselves to notice the movements of a small gathering of newly arrived warblers. How graceful they are in the sunlight as they flit suddenly from twig to twig in and out of the cat-brier thickets; their colorings how harmonious, the shades so delicately blended. How deftly do they seize the unfortunate insects which their eyes skillfully detect. We secure a few specimens and move to the meadow below. Now "faint from further distance born" is heard the shrill whistle of the noble meadow lark, as he wildly pursues his consort over marsh and meadow. As we cross the moorland, a bittern flaps lazily up, and with a hoarse croak flies a short distance, then settles down again to his marshy home. From the partially submerged meadowland the little sandpiper, the tiniest of the species, darts up and zigzags off high in air, imitating in his evolutions the movements of his more formidable relation, the Wilsons snipe. Passing again to higher ground, the bursting, bubbling notes of the bobolink, the champion songster of the meadows, salutes the ear from every side. Now to the right, now to the left, and again immediately overhead he glides. Again is he seen in wanton and swift pursuit of his modestly dressed lady. Suddenly he pauses in his hot chase, and floats slowly down with upstretched wings and dangling feet, pouring forth his gushing song as though the small compass of his body were wholly inadequate to the task of expressing his full feelings.

Wrapt in unspeakable thought we gaze upon the scene. Far beyond us the giant woods, thrown athwart the sky, form a fit setting to the intervening picture. The air is vocal with the music of a hundred sounds. The orioles, with their clear whistle, are high up in tulip and buttonwood. The robin's song re-echoes from hill and dale. The piping of the quail sounds cheerily from the hedgerow. The dull drumming of the partridge, the soft cooing of the wood-dove, the low murmuring of the forest rivulet, the sleepy whisperings of the pines, all blended in one sweet monotone, serve gently to lull the spirit into sweet repose. *Vade mecum.*

SPORTS AND SPORTSMEN.

OBSERVATION has led to the conclusion, that all who claim the title of "Sportsman" are not entitled to the name. The terms sport and sportsman are not synonymous, although many would like to have them so. The gentleman sportsman is as widely removed from the genuine "sport" in point of respectability, as the field of action is higher and nobler. No doubt they who follow the various branches of out-door sports, from the highest and most respectable to the lowest and most thoroughly degraded, consider the more perfect types of their respective branches the only true, pure, and perfect beings worthy of the name sportsman.

We of the rod and gun are not behind in the above particular; we claim the title, and claim it honestly, and can prove (to our own satisfaction at least) that we who love to shoot and fish have some in our ranks who are sportsmen "par excellence" in the full and perfect usage of the term. We are not all such; far from it. To simply be able to kill ten straight birds from a plunge trap does not fill the bill; nay, nor to kill three out of five shots at quail, woodcock, or ruffed grouse the season through, is the standard. Do not even the "pot-hunters" the same? Neither does it consist in that dexterity at fly-casting or bait-fishing that insures the fullest creels. None of these. Our sportsman is a different being. You won't always find him attired in broadcloth or a "Hola-bird" suit. He is not necessarily secretary or president of a high-toned sportsman's club. No; it takes something besides wealth and position to form this being. Then what is he? what are the competent parts of this rare subject of which we are writing?

We will answer—not by giving a prescription for his "make up," for he is not a manufactured article. He will not develop under "blue glass," but blue sky will help him on amazingly. The true sportsman is a spontaneous article—born so as it were. With his first ideas his love of nature shows plainly out, and with coming years the development goes on until, with experience added to experience, he steps forth full full fledged, the first of his kind. He must be a gentleman in every respect, be he in camp or court, polite, civil, always looking to the welfare of others. He must ever carry about with him that "something" that to even the casual observer bespeaks the gentleman though he open not his mouth.

A keen lover of nature must he be, drinking in all her sublime changes; finding a pure delight in watching the various little minutiæ of the varying seasons. He must recognize in looking up through nature, nature's God; find beauty in the clouds and music in every rippling stream; the carol of birds must be to him the sweetest melody on earth and every opening flower a type of loveliness. Also somewhat of a naturalist and botanist must he be—ever on the alert for specimens of rare animals and plants, besides having a trace of ichthyology and taxidermy in his composition, and a sprinkling of geology. So we have the mechanical "make up" of the true sportsman.

But it is to be his moral "make up" that we must look for more striking peculiarities that go to distinguish him from the ordinary run. Many who lay no claim to the title are adepts in the sciences above enumerated, and nothing more—mere scientific machines, who, although giving much useful information to the world, could not be sportsmen if they would. We see happy combinations of science and true sportsmanship occasionally refreshing from their very rarity. Let us consider then "*Audubon.*" A simple mention of his name is all sufficient. Every intelligent reader of this paper has but to hear that name to be thrilled with the thought, that at least one purely scientific man has lived who was a thorough sportsman.

Such a man must be a keen observer and a close student; little things as well as great must be noticed by him, and the "reason why" as assiduously studied, be the object a burning mountain or the simple changing color of a leaf. It is understood that he will know how to shoot and fish to edification, for versed as he is in natural history and ichthyology, the habits and haunts of game and fish are as an open page to him, and knowing these, what is simpler than to profit by the knowledge?

But one of the grandest attributes of his character is his sociability. How it shines forth in the wilderness, brightening up the camp with its beaming effulgence. No one gets homesick or blue when your true sportsman is around, always ready with some diversion to drive away dull care. He is always busy; the camp he represents never lacks for comforts; the larder is always full; the fire burns with good, dry wood (he don't depend upon a guide); the beds of balsam boughs look very inviting in their softness; there is a rack for the guns, a store tent, and you might live in that little camp a whole season, providing our sportsman stayed and ministered to you.

Your true sportsman may be a backwoodsman, partly forced by circumstances and partly drawn by love to erect cabin in the wilderness, and hew out from the primeval forest a living and perhaps a competence; or a simple guide, born and brought up far from the haunts of men, a veritable "Natty Bumppo" in whom there is no guile—a sportsman by nature, his home wherever night overtakes him, his companions his hound and rifle, his church the green aisles of God's cathedral. Who could help being a pure sportsman under such influences?

Many who read this have found just such types described above, and almost envied them their free, wild life and thorough knowledge of the gentle science of woodcraft.

But the true sportsman is also found in our great cities and busy towns; he fills the best positions, and fills them most successfully. In the pulpit, at the bar, in the sanctum, the office, and the warehouse he shines forth. At home he is genial and kind. Secure his friendship and you will find him a friend indeed.

We don't believe a thorough sportsman can be depraved. He must have elements in him that will lift him up and keep him up. If a man loves nature and enjoys out-of-door life it is hard for evil to get hold of him. He rises superior to petty strifes and bickerings, and shows himself to be

"Nature's own nobleman, friendly and frank,
A man with his heart in his hand."

GAME PROTECTION.

NEW YORK.—The Dansville Sportsmen's Association have had 25,000 brook trout placed at their disposal by Seth Green, and have appointed a committee to visit the State Hatching House when the fry are ready for delivery. The Association has also a large number of live quail, to be turned out whenever the weather will permit. At the last meeting a motion was made and adopted that the different clubs of the country be conferred with preparatory to taking measures for organizing a County Sportsmen's Association, and that a meeting of delegates of the respective clubs to consider the subject be held at Mount Morris on Wednesday, April 4th, at three o'clock P. M.

The Nashua Fish and Game Club, which has for its object the stocking of ponds and streams with game fish, the protection of game and fish in close season, and the instruction of its members in the study of the habits and peculiarities

of the fish and game that are considered worthy of the angler's or sportsman's attention, has just been organized in Nashua, New Hampshire. The following gentlemen are the officers of the Club:

Dr. Edward Spalding, President; Virgil C. Gilman, Vice-President; Geo. F. Andrews, Treasurer; Chas. E. Whitmarsh, Secretary; Edward E. Parker, Attorney; Alfred W. Greeley, Gilman C. Shattuck, Aaron F. King, Executive Committee.

CONNECTICUT.—We have received copies of a new Game Bill which, our correspondent writes us, really has passed the Connecticut Legis'nture, and become a law. There have been reported to us so many bills as having been before that body, that we trust the deed has finally been consummated, and we shall not have to report any further changes for a year, at least. The principal feature of the new law is, wherein a universal close season is made for quail, ruffed grouse, and woodcock, doing away with summer shooting. Following is a brief extract:

SECTION 1—Makes it unlawful to kill or attempt to kill any woodcock, quail, or ruffed grouse between January 1st and October 1st, the penalty being not more than $25 for each offence.

SECTION 2—Forbids the taking the eggs or destroying the nests of any of the above birds, under a similar penalty.

SECTION 3—Prohibits (except on one's own land) the snaring, trapping, or netting of any of the birds mentioned in Section 1, under a like penalty.

SECTION 4—Refers to the transportation of said birds during the close season, under a like penalty.

SECTION 5 and 6—Forbids trespass upon enclosed grounds, without permission, provided the owner has six printed signs or notices in as many conspicuous places on his land.

SECTION 7—Prohibits shooting on Sunday.

PENNSYLVANIA.—The *Easton Free Press* says:

"In the Quarter Sessions Court in Philadelphia, yesterday, before Judge Finletter, Lewis Hoops and William Evinson were charged with exposing rabbits for sale on December 23d in violation of the game laws. The law prohibits the exposing for sale of game between December 15th and October 15th in any one year, and under that act Judge Finletter said he could not sentence the defendants, even if they were convicted. Of laws there were none that should be more rigidly enforced than the game laws when they could be, but this act made this an impossible offance, because there could be no interval between December 15 and October 15 in one year, and the Court could not insert in the law, "between December 15th of one year and October 15th of the succeeding year." The bills were submitted and verdicts of not guilty taken.

It would be well for some other States to look to their laws and see if there is not the same loop-hole of escape for infractors.

PENNSYLVANIA, *Erie, March* 29, 1877.—The game association of this place have purchased fifteen bushels of wild rice, which they propose to sow on the peninsula this spring. This peninsula protects the harbor of Erie, one of the finest harbors on the chain of lakes, and is interspersed with numerous ponds and marshes. A crop of wild rice would make it a great resort for ducks, without doubt. The Fur, Fin, and Feather Club was recently organized at North East, near this place. The weather is still cold here, this side of the lake being covered with a heavy body of ice. The ducks and snipe have not yet made their appearance. We have a few ducks in their season, and good snipe grounds. Owing to our severe winters there are no quail here. The game association have ordered one of the Bogardus patent traps for throwing glass balls, and 1,000 balls for practice. Although numerous changes were suggested, no change was made in the game law of this State by our Legislature, except with regard to deer, the season being now from October 1st to December 1st. D. R. C.

VIRGINIA.—As a very suitable appendix to our article on "Virginia as a Sporting Ground," published in our issue of March 22d, we now give a brief abstract of the new game laws of Virginia as recently passed by the Legislature. Hitherto such enactments as have been in force have applied to particular sections or counties only, but the new law is general.

SEC. 1. Makes a close season for quail between February 1st and November 1st, and prohibits netting or trapping for two years.

SEC. 2. Makes a close season for ruffed grouse between February 1st and August 1st; for woodcock between February 1st and July 1st, and robins between April 1st and November 1st; and protects thrushes, cat-birds, cardinals, wrens, orioles, etc.

SEC. 3. Says: "It shall not be lawful to kill or capture any wild water-fowl in this State between the first day of April and the first day of September of each year, except the wild duck commonly known and called the summer-duck, and except the wild fowl commonly called sora; or during the night, that is, between dark and day-break; nor shall it be lawful to kill wild water-fowl, except with a gun that can be raised at arm's length and fired from the shoulder without a rest. Wild geese may be killed either during the day or night. Provided that in no case shall floating reflectors or lamps be used in shooting wild geese in the night time."

SEC. 4 reads: "It shall not be lawful to kill or capture wild turkeys between the 1st day of February and the 15th of October of each year, nor at any time by traps of any kind."

SEC. 7. Protects deer between December 15th and August 15th. The penalty for each offence is $20, and the act goes into effect on July 1st next.

FISHING IN VIRGINIA.—The Legislature of Virginia has recently passed an act to prevent the destruction and to promote the multiplication of fish in the streams of that State. It provides that during the next six years no fish shall be caught otherwise than by angling in any streams above tide-water. It is made unlawful to take mountain trout between September 15th and April 1st by any process whatever, and at other periods only by angling—a similar provision applying to black bass between May 15th and July 1st of each year. Possession of these fish within the prohibited periods to be prima facie evidence of violation of the law. The penalty for infraction of the law is fixed at a fine in each case of $20 and imprisonment until the fine be paid. The offender is also to forfeit his boats, nets or other illegal contrivances in such taking of fish. The act is now in force.

—The Mississippi Legislature has passed a very stringent law, approved Feb. 1st, imposing a penalty of $100 on all trappers from other States of beavers and other animals captured for their fur in the State of Mississippi, and permitting counties, towns and cities to levy an additional tax not to exceed fifty per cent of the above sum.

THE COMING STATE SPORTSMEN'S CONVENTION.

[The considerations presented below by a thoughtful correspondent, demand respectful attention.—ED. F. AND S.]

SPORTSMEN of New York State are looking forward with great interest to the coming meeting of the State Association at Syracuse this spring. Grand results are looked for by honest sportsmen, and it is to be hoped they will not be disappointed. Syracuse is a grand centre to hold this meeting; easy of access to all parts of the State, its inhabitants renowned for their hospitality and courtesy toward strangers, and its sporting organizations perfect in their discipline and composed of gentlemen in every sense of the word.

What is the object for which these yearly meetings are held? Why do the different associations for the protection of fish and game make yearly pilgrimages to some given centre, as faithfully as the "Moslem to his Mecca?" This State Association was formed for high and noble purposes—partly for social good, but mainly to devise ways and means to protect and replenish our terribly depleted fields, forests, and streams.

The above is ostensibly the purpose for which the annual meeting is to be held at Syracuse, and has been held at other places in times past. But now the question arises: Has the State organization done those things expected of it? Have the sportsmen who, through force of circumstances, have been debarred the privilege of attending these associations, been satisfied with the results of the meetings of their more favored brethren? Has the good resulting from the organization been of great and lasting benefit, such as we, as a Commonwealth, can be proud of? I fear not.

Look over the minutes of previous meetings, particularly the one held at Geneseo last year, what do you see in the way of business? Absolutely nothing. Oh! but they had a big shoot, lots of fun, and there were a great many clubs represented. The magnificent 500-acre lot, so kindly placed at the disposal of the association by Mr. Wadsworth, was dotted with club tents, and in these tents was everything in the way of eatables and drinkables—and that was about all it amounted to. The dog show was a failure, but the pigeon shoot was a grand success; and so hard did the delegates work in this latter direction, and so seductive were those tents with their gaily flying streamers, and unbounded hospitality, that when the business meeting in the evening was held, they say the attendance was not very large or enthusiastic, and the business done did not crowd the secretary to chronicle.

Now is this right? Ought the weightier matters of the association to be neglected for those trivialities which give but a moment's pleasure, and are of no benefit to any one?

"The New York State Sportsmen's Association have procured ten thousand wild pigeons for the meeting at Geneseo."

The above item went the rounds of the papers a year ago, and was considered as something wonderful; and well it might be, for the massing of ten thousand wild pigeons is not an everyday occurrence—and that was about all the country knew of the meeting. To be sure, the readers of FOREST AND STREAM saw an account of the proceedings, which, although exhaustive, detailing the whole thing, amounted to simply nothing, for the simple reason that they were the faithful chroniclers of NOTHING.

That there were members at the last meeting who went home dissatisfied there is no doubt. Thankful are we that there are some who look upon the annual gatherings of the New York State Sportsmen's Association as something besides "boys' play;" as something in which dignity and decorum is as necessary as in legislative halls; who attend these meetings to engage in them heart and soul; men to whom the chairman's voice, "carried," announcing the passage of some good protective resolution, is far sweeter music than the cry, "dead bird."

Does the long line of delegates, each with his gun case in his hand, passing from their hotels to the grounds, bound to win a reputation they have not in the legitimate field, look to the outside world as if very extensive measures were to be taken for the protection of game? I think not. Do lunch counters and kegs and demijohns *ad libitum* in every tent, look like a sober consideration of matters of vital importance to our children, whom we hope to instruct in the manly art of sportsmanship? Gentlemen—delegates—you have the matter in your own hands. It rests with you whether this forthcoming meet of New York State sportsmen shall be a meeting of earnest gentlemen, bent on furthering the interests of the fraternity and the State, or a lot of "the boys," bent on sport, and giving precedence to the mere slaughter of innocent pigeons and the absorbing of "the rosy." Let us hope that the coming meeting at Syracuse will be long remembered as the one where the true sportsmen of the Empire State met and worked for the interests of the fraternity they represent, and win laurels more lasting than those of previous gatherings. LOOKER-ON.

GREENWOOD LAKE, Orange County, New York, March 30, 1877.

EDITOR FOREST AND STREAM:

Knowing the interest you take in all matters for which our club was organized, I take pleasure in handing you the report of our "Fish Warden," this day received. It covers only the months of Sept., Oct., Nov., and the first part of December, the lake being closed from the latter part of Dec. until now. He reports three thousand feet of gill nets taken, also ten thousand feet of set lines; had two men arrested and taken before Justice Hall. They were discharged, however, as the evidence was not sufficient to hold them; he saying if brought before him again they would not get off so easily. We have placed in the lake six thousand California salmon from the New York Aquarium, and fifty thousand salmon trout from Seth Green, Esq.

Very respectfully yours,

H. C. COOK, Treasurer.

OUR WASHINGTON LETTER.

FROM OUR OWN CORRESPONDENT.

GAME AND OTHER BIRDS OF THE DISTRICT OF COLUMBIA—THEIR HABITS, HAUNTS, ETC.—AN INTERESTING FIELD FOR SPORTSMEN AND NATURALISTS.

WASHINGTON, D. C., March, 1877.

THE District of Columbia and the neighboring counties of Maryland and Virginia, with the many varieties of game birds frequenting these localities at nearly all seasons of the year, not only present an attractive field for the sportsman, but the extensive and interesting *avi fauna* found in this vicinty makes it doubly attractive for the student of natural history, especially in the spring and autumn. Although it may seem incredible, we have here, including permanent residents and annual visitors, 226 distinct varieties of birds. Of these, 44 are permanent residents, 54 are regular visitants, 25 are accidental visitants, 44 are winter residents, and 59 are summer residents. The most complete list of birds ascertained to inhabit the District is that prepared by Dr. Elliott Coues, now a surgeon in the army, and Dr. D. Webster Prentiss, at present a prominent physician of Washington. This list was prepared by them when they were college boys, and was made up after five years' actual observations in the field, during which time they collected about five thousand specimens, many of which were deposited in the Smithsonian Institution. While collecting their specimens they were students and classmates in that time-honored institution, Columbia College, but the care and accuracy with which their work was done would have reflected credit upon older heads. Though sixteen years have elapsed since its preparation, not more than a dozen species have been added to it, and of these a majority are indicated in their list as probable visitants, though they were not actually observed. Dr. Coues, it is well-known, has devoted his life to the study of natural history, and his numerous works in regard thereto have a world-wide reputation. He has more valuable works in print on that subject than any other naturalist of his years. His classmate—Dr. Prentiss—though still deeply interested in all that pertains to that beautiful study, found the demands of his profession steadily encroaching upon his taste in this direction, and has had to abandon in a measure the pursuit of his early inclination. Dr. Coues, with his honored position in the army, has rapidly come to be one of the first naturalists of our country, and his interesting articles, which often appear in FOREST AND STREAM, are extensively copied. The list of birds prepared by them is valuable, not only on account of having every species mentioned and fully described, but it also gives the times of arrival and departure of such as are now residents, with brief notices of the habits of all birds found by them.

In the list of game birds I rank the woodcock first. This bird is a permanent resident and frequents low, marshy grounds and moist corn-fields. In early spring it is found in low woods and thickets. Dr. Coues, in his admirable work on "Birds of the Northwest," says: "The woodcock is by no means so exclusively an inhabitant of bog and brake as those who are not entirely familiar with it may suppose. It frequently visits corn-fields and other cultivated tracts in the vicinity of swampy grounds, and often betakes itself to the woods, where it rustles among the dry leaves, turning them over to search for food. It is erratic, or rather capricious, in its resorts as well as in its general movements north and south. A few linger, unless the season be very severe, in the middle districts all winter, but they are generally off for the south with the freezing of the ground. A cold snap will suddenly drive them away altogether from places where a few hours before they had been found in numbers. The general and regular movement occurs chiefly in March and October. Some reside in the south, but the greater number pass north, to return again in the fall None appear to winter, except casually, beyond our middle districts."

The favorite feeding time for these birds is about the dusk of evening, and I believe they migrate at night. Some time ago, while walking along one of the principal streets in the heart of the city about 9 o'clock in the evening, my attention was drawn to something on the sidewalk, which I found to be a full-grown woodcock seriously hurt but not dead. I was at a loss to account for the presence of the bird at this place, but the mystery was soon solved when I observed a telegraph wire overhead, against which the bird struck in its flight and was fatally injured. In this locality they mate in February, and I am sorry to say that they are not protected. We have a game law forbidding the killing or sale of them between the 1st day of January and 4th day of July, but I understand that they have been for sale in market within the past two weeks.

Our next game bird is Wilson's snipe, better known as "English," or "jack snipe," and sometimes they are plentiful enough to afford excellent sport. They are spring and autumn visitants, and are now here on their way north, though they have not been plentiful this season. They return from the north in flocks early in September, and remain in this vicinity about two weeks. Snipe frequent low meadows and marshy ground, and in the spring very often arrive one night and leave the next. Indeed, it is a very common occurrence to find the snipe quite plentiful on a marsh or meadow one day, and upon the next not the first sign of one. As an instance, I may mention the fact that Col. Amzi Smith, of the Senate Document Room, a few evenings since was walking over a piece of meadow near his country residence, accompanied by his favorite Gordon setter, but unfortunately without his gun, and in less than half an hour the dog put up a dozen snipe, most of them being handsomely pointed. Col. Smith was on the meadow early next morning with gun and dog, but not a snipe was to be found

all of them having left during the night on account of a slight fall in the temperature.

Our next game bird is the "American partridge," a permanent resident, and still abundant, even in the immediate vicinity of the city. While they breed to a great extent in this locality, the number is considerably increased every spring by migrations from more southern latitudes, and every fall by birds from the north on their way south. A pair of birds will raise two broods a year, averaging seven or eight to a brood. The close season for them under the District law is from the first day of January to the first day of October. Another permanent resident is the "ruffed grouse," or "pheasant," though not plentiful. They are found in the most impenetrable laurel brakes, and are procured with much difficulty. The close season for them in the District is from the first day of January to the first day of September. They are more abundant in some of the neighboring counties of Maryland and Virginia, and are sent to our markets in season from these counties. This bird goes under different names in different parts of the country. Dr. Coues, in his work above referred to, says: "We are often asked is it a partridge, or is it a pheasant? to which reply may be made that it is *neither*, but a grouse. 'Pheasant' is a name of a variety of birds of the family *Phasianidæ*, indigenous to Southern Asia, and not represented in this country at all. The best-known species is that one long ago introduced into England, and there thoroughly naturalized. (The nearest American representative of the pheasant is the wild turkey, which is sometimes included in the family *Phasianidæ*.) 'Partridge' is the name of a group of small gallinaceous birds, which, like the *Phasianidæ*, belong exclusively to the old world—our American partridges, so-called, being quite a different set of birds." He expresses the opinion that it would simplify matters much to discard altogether the terms "pheasant" and "partridge," by which this species is known respectively in the Northern and Southern States, and call it by its proper name of "ruffed grouse."

Wild turkeys are still abundant in the neighboring counties of both Maryland and Virginia, but they have become extinct in the District on account of the great increase of population and rapid settlement of the country. They are regularly found in our markets in season, being sent here principally from Virginia, where they are plentiful. On one occasion while on a partridge shooting excursion near Manasses, in that State, my companion and I sat down in a pine thicket to eat lunch, and while thus engaged a drove of eight or ten turkeys appeared coming directly toward us, but as quick as we discovered them they discovered us, and in less than a minute they were out of sight, much to our disgust. They are exceedingly shy, and are more frequently trapped than shot.

Wild pigeons make their appearance in flocks at irregular intervals throughout the fall, winter, and early spring months.

In September and the early part of October the ortolan and reed bird shooting on the marshes of the Potomac and Eastern Branch affords rare sport. These birds are abundant at the time mentioned, and it is no uncommon thing to bag eight or ten dozen reed birds and three or four dozen ortolan in a day's shooting. The ortolan, also known as "rail" and "sora," is a spring and autumn visitant, rare in spring, but very abundant in fall, from the last week in August until the first frost. The reed bird, also known as "bobolink" and "rice bird," is a spring and autumn visitant. In spring it is distributed abundantly about orchards and meadows, and even at that season is generally in flocks from May 1st to 15th. The autumn visits are made in immense flocks, and at this time they soon become exceedingly fat on the wild oats which grow in the marshes. The bird is esteemed as quite a delicacy in the fall when fat, and they readily bring from 75 cents to $1.25 per dozen in our markets. Besides the two last-mentioned species, the fresh water marsh hen, "King Ortolan," is found sparingly in early autumn in the marshes along the rivers with the common rail. The Virginia rail is also a spring and autumn visitant, though it is very rare in the spring and not abundant in the fall. It arrives about the last week in August and departs upon the appearance of frost. The habit which birds of this variety have of skulking and hiding in the almost inaccessible places they frequent renders them difficult of observation, and they are usually considered rarer than they really are.

The greater tell-tale tattler, better known as the "yellow-shanks plover," is a spring and autumn visitant. It is common in spring from May 1st to 15th, and in the fall from the middle of September to November. It is generally seen singly, though sometimes two or three are found together. Its favorite haunts are banks of the rivers, boggy meadows, and commons intersected with pools. The lesser tell-tale tattler also appears with the former, and its habits are similar in every respect. This bird is also known as "yellow-shanks plover," but is much smaller than the first-named bird of that species. The golden plover, sometimes known as "bull-head plover," passes quickly through this locality in early spring, but in the fall they are quite numerous, and are found about fields and plowed land during October and November.

I have thus briefly referred to such birds in the list as are sought by sportsmen, but there are many varieties described which makes the list of great interest to naturalists, and I believe it is to-day recognized as the best local list that has ever appeared in North America. To give some idea of the the specimens collected by these enthusiastic naturalists in their boyhood days, I need only mention that they found among the birds of the District ten species of hawks, six of owls—among them the great horned owls—even of woodpeckers, five of swallows, about thirty of warblers, besides many fly-catchers, thrushes, wrens, cuckoos, buntings, sparrows, grosbeaks, blackbirds, robins, larks, herons, sandpipers, and other varieties too numerous to mention. Even our great emblem of freedom, the bald-headed eagle, is a permanent resident of the District. It is frequently seen sailing along over the river, or perched upon stumps and snags on the flats. The golden eagle is also found in this locality, and two specimens secured in the District are now in the Museum of the Smithsonian Institution.

The various species of water fowl frequenting the Potomac are also fully described. About twenty varieties of ducks are noted, together with the times of their arrival and departure. First, there is the delicious canvas-back, a winter resident, and at times abundant. Next we have two species of mallard, all of them plentiful; red-heads are abundant, and are frequently sold in market as canvas-backs. Then we have blue-winged teal, green-winged teal, black-heads, buttor-balls or buffel-heads, sprig-tails, golden-eyed wood duck, and other varieties in great numbers. The American swan is not common in the immediate vicinity of the the city, though sometimes it is quite plentiful on the lower Potomac, and is always for sale in our markets. Wild geese are common along the river, and are frequently seen in the air flying over. They arrive here in the fall, just before the first approach of severe weather, and are found in market throughout the winter. With such a supply of game birds and water fowl the sportsmen of Washington are thoroughly satisfied, and if we can only have proper game laws, rigidly enforced, there will be no decrease in the game for many years to come.

The list of Drs. Coues and Prentiss, from which I have quoted, was the first one of birds of the District ever prepared, and it gives the habits of the birds from actual observation. As illustrative of the enthusiasm of the young naturalists I mention the fact, that in spring and fall they were up by daylight and off to the woods, in the neighborhood of the college, for the purpose of collecting specimens. At half-past eight the studies of the day were commenced, and the young ornithologists were frequently compelled to hide their gun barrels in the legs of their pantaloons, the stocks under their jackets, and thus steal in to their rooms to avoid punishment, for the professors in the institution were of the opinion that their expeditions to collect specimens amounted to truancy, and that the time thus spent should have been given to the conjugation of a Greek verb, or the demonstration of some difficult problem in geometry. Of course the young naturalists were frequently in trouble with the faculty, and received numerous lectures. Every dead bird or reptile found about the college building or grounds was always traced to Coues and Prentiss. On one occasion the young gentlemen became involved in quite a serious difficulty, on account of having brought a watermoccasin, which they shot on one of their expeditions, into the building, where it was found by another student, who was always full of mischief and ready for a joke. He took it to the recitation room, coiled it upon the chair of the tutor, and covered it with a newspaper. In a few minutes the tutor entered the room with text books in one hand and hat in the other, brushed off the paper with his hat, and there lay the snake—books went one way, and hat another, much to the amusement of the young gentlemen of the class. As a consequence there was a great row, and the faculty made every effort to discover the one who placed the snake on the chair, but without success. Coues and Prentiss were severely reprimanded for bringing the reptile into the college building, and notified that a repetition of the offence would not be excused. The grass has long grown green on the graves of both tutor and the mischievous student, but their memory is cherished by the college boys now scattered over the wide world.

Rifle.

RIFLE NOTES.

Creedmoor is officially declared open.

The first competition this year will be for the Remington prize, $300 in gold.

The Spring Prize Meeting will take place on May 24th and 25th.

Mr. Brower, Superintendent of the range at Creedmoor, thinks well of the Stone targets.

Several riflemen are going to wear blue glasses this season.

Conlin's benefit is progressing nicely at Zettler's Rifle Gallery.

A match between the long-range riflemen of Brooklyn and and New York city will take place this spring. It is causing considerable talk, and a "tight rub" is expected.

The terrible spitz dogs are made the "butts" of many remarks and the targets for numerous blunder-busses.

The present military sights are justly complained of in relation to their crudeness. A good firearm with poor sights is but little better than a poor one with good sights.

The members of the Helvetia Rifle Club are going to have a grand time in May to celebrate the organization's twenty-fifth birth day. This is the original Swiss shooting club on this side of the Atlantic.

Several clubs have been reported as being willing to cooperate with the Amateur Rifle Club of this city for the proposed Irish-American match.

The Seventh Regiment's shooting galleries have been a splendid source of amusement and aid to the members this winter, and an improvement in their scores may be expected at Creedmoor in consequence.

Capt. Bogardus is giving exhibitions throughout the country shooting at glass balls thrown from a trap. The "wing" shooters seem to like the balls; as shooting at them is almost as much fun as that of killing pigeons from the traps.

Wm. Hayes has been making some extra good scores lately with a new Ballard, 200 yards range, at Newark, N. J.

G. W. Yale is going to shoot the Wesson long-range rifle this year.

At Boston, Spy Pond Range, the canvass targets are preferred to all others.

Hellwig's "money prize match" is quite a success. The entries are numerous.

Comptroller John Kelly, of this city, is a life-member of the N. R. A.

NATIONAL RIFLE ASSOCIATION.—We have received the Annual Report of the N. R. A., which contains a record of the past year's events at Creedmoor and on the ranges of affiliating clubs. A meeting of the Directors was held on Tuesday week. The Secretary reported in reference to the award of diplomas to the winners of prizes in the Centennial matches at Creedmoor last fall, that nothing could be done until the next meeting of the Executive Committee of the Centennial Commission, and he was instructed to continue to look after the matter. On motion, the range was declared open for the ensuing season. The Adjutant-General will pay the Association $4,500 for the use of its range by the National Guard on three days of each week during the coming season, provided that 20 markers be provided on each occasion instead of 15, as was the case last year. A communication was received from the Washington Grey Cavalry Troup asking that provisions be made in the programme for the spring prize meeting at Creedmoor for a match between teams representing the several cavalry troops. The programme for the spring prize meeting, which will take place on May 24th and 25th, was next taken up and adopted as follows, most of the prizes to be announced hereafter:

Directors' Match.—Open only to the Directors and honorary Directors of the National Rifle Association: distance, 200 yards; position, standing; weapon, any rifle; two sighting and five scoring shots; entrance fee, $1; prize, the Directors' Championship Gold Badge, to be held by the winner during the year.

Short-Range Match.—Open to all comers: distance, 200 yards; position, standing; weapon, any rifle; two sighting and seven scoring shots; entrance fee, $1.

Military Match.—Open to teams of five from any company, troop or battery of the National Guard of New York, or other States, or of the regular Army or Navy, or Marine Corps, to be composed of company officers, non-commissioned officers, or privates, who have been members since March, 1877: distance, 200 yards; position, standing; seven scoring shots; teams to use the rifles with which their companies are armed; entrance fee, $1.

Cavalry Match.—Open to teams of five from any troop or battery of the National Guard or of the United States Army: distance, 200 yards; position, standing; two sighting and seven scoring shots; entrance fee, $1.

Mid-Range Match.—Open to teams of five from any company, troop, or battery of any State, or the regular army, Navy, and Marine Corps; any position; distance, 500 yards; entrance fee, $1.

Individual Match.—Open to all-comers; any rifle; any position; 10 scoring shots; entrance fee, $1. Second-class targets will be used in this match, with a "cartoon" 11 inches in diameter covering the "bull's-eye."

Leech Cup.—Under the auspices of the Amateur Rifle Clubs; open to all native-born citizens of the United States and resident members of the Amateur Rifle Club, regardless of nationality; distance, 800, 900, and 1,000 yards; any position; 15 shots; entrance fee, $1 to members and $2 to outsiders; prize, the "Leech Cup," to be held by the winner throughout the year.

Running Deer Match.—Open to all comers; any rifle; no windage allowed; distance, 100 yards; position, standing; five shots, to be fired consecutively; entrance fee, 25 cents, each competitor to be allowed four entries; a fine of 10 cents for not firing or not hitting the haunch; such fines to be divided among the three highest scores. The deer will be run as a bull's-eye target during the morning.

It was decided to extend the invitation embodied in a resolution passed by the board in February last—to enter into competition for the Centennial trophy—to all who were invited last year, giving them until June 1st to accept the invitation.

AMATEUR RIFLE CLUB.—The annual meeting of the Amateur Rifle Club, of New York, will be held at the Seventh Regiment Armory, corner of Third Avenue and Sixth Street, on Thursday evening, April 3d, 1877, at eight o'clock. Besides the election of officers, the invitation of the Irish Rifle Association and other important matters will be brought before the club for discussion and action. A large and prompt attendance is earnestly requested.

CONLIN'S BENEFIT TOURNAMENT.—This match, which opened at the Zettler's Rifle Gallery, 207 Bowery, on March 17th, is progressing finely. Over 250 tickets have already been shot, and the interest in the competition increases nightly. The large number of prizes offered adds greatly to the spirit of the competition, as it insures to the fair average shot a chance of gaining a valuable trophy. The following are a list of the prizes already received, besides which several others are promised, and will undoubtedly be given within the current week:

Prize, ———, presented by Zettler Rifle Association.
Prize, ———, presented by Arnold & Constable Rifle Club.
Valuable solid gold medal, presented by William Hayes.
One Ardito stereoscope, presented by James Molinari.
One fine gold and silver plated and engraved revolver (large size), presented by Henry Fulton.
One magazine revolver (new style), presented by E. Remington & Sons.
One gold and silver plated revolver (large size), presented by Schuyler, Hartley & Graham.
One nickel plated revolver, presented by E. S. Harris.
One box fine segars, presented by Sandy Spencer.
Three gold plated medals, five silver plated medals, fifteen bronze medals, presented by L. V. Stone, J. B. Blydenburgh, Charles A. Cheever, C. E. Blydenburgh.

Additional prizes will be duly noted in these columns as they are contributed. The tickets are fifty cents each. A competitor may shoot as many tickets as he desires. No person can win more than one prize. The entire proceeds of the competitions will be presented to Mr. Conlin, to assist him in speedily refitting and opening his gallery, and it is hoped, that in view of the uniformly courteous treatment which all have received at the hands of Mr. Conlin, that he may have a rousing benefit. Tickets and further information can be obtained by applying to any member of the Committee. Committee of Arrangements, C. G. Zettler, L. V. Sone, M. L. Riggs, J. B. Blydenburgh, B. Fenning, Charles A. Cheever, D. L. Beckwith, C. E. Blydenburgh.

UNACCOUNTABLES.

LAKEVILLE, OT., *March* 26, 1877.

EDITOR FOREST AND STREAM.

In your issue of March 14th is an article on unaccountable misses from "Onicko." He seems to think the trouble is not in the gun, but in the ammunition used. I quite agree with him. I have used a breech-loading rifle for a number of years, and it is the best gun I ever handled; but I find, no matter how perfect the gun may be, I cannot do good shooting without the ammunition is perfect. My method of loading cartridges is to fill the shell, leaving only space enough to put in a thin cut wad of pasteboard, and not over one-eighth of an inch in which to seat the bullet; that leaves nearly the whole length of the bullet in the rifling of the barrel when the cartridge is in the chamber; and if the bullet is the *right size* and *properly patched*, the patch will not be torn in putting the cartridge into the chamber (or in the passage of the bullet from the shell into the barrel when fired), if the gun is *properly made* and *clean*, and it will also straighten the bullet in the shell if it is a little loose, owing to the short distance it goes into the shell.

The pasteboard wad over the powder has its advantages and its disadvantages. If the bullets fit the shells loosely, it prevents the powder spilling out in carrying, if the bullet comes out, and it also serves in a measure as a gas check and prevents in a measure fire cut. But if the bullet is concaved much in the base, the wad is liable to be forced into the hollow base of the bullet and go with it. I have found the pasteboard wad, lubricator, and part of the patch at eight hundred yards from the firing place, lying beside or sticking to the bullet, and in one instance, part of a dry pasteboard wad, when no lubricator was used, was found sticking to the bullet; the bullet was shot into the snow at five hundred yards. I never use lubricator of any kind when I want to do fine shooting, but use a dry paper patch and wipe the gun clean and dry after every shot.

Another very important item is the composition of the bullet, which must be of a hardness in proportion to the amount and strength of the powder used. A bullet that would be hard enough to use with seventy grains of powder and shoot well, would be good for nothing to use with a charge of one hundred or one hundred and ten grains. It would be up-set so it would take the rifling beyond the patch, unless the bullet was patched the whole length. Fix upon some particular brand of powder that you can always get, and the quantity to be used for your charge, then make some bullets, weighing the lead and tin (if tin is used to harden), making a note of the proportions; load some shells with your standard charge of powder; patch the bullets carefully, wetting the patch quite wet in the mouth, and draw it on as tight as you can without tearing, and stick the edge down with mucilage, using as little gum as possible. Do not attempt to seat the bullets until they are perfectly dry, then shoot them into a *snow bank*; they will penetrate it from three to six feet, according to its density, when they can be readily dug out, and if they do not hit anything harder than snow, they will be found as perfect as when they left the gun. If they are upset so as to show the groove one-half or five-eighths of an inch they are about the right temper; but if they are upset more they are too soft, and if not as much they are too hard, and more or less tin should be used; when casting bullets stir the metal often.

Then the size of the bullet is another point to be attended to. If it is too large it is apt to bind in the grooves of the gun in inserting the cartridge, and tear the patch; and if too small and is loose in the shell, it is liable to slide a little toward the muzzle if the gun is held muzzle downward, and also to be *driven forward a little by the blow of the firing-bolt upon the cap before the charge is ignited*. All these little things make a difference in the shooting and help to produce unaccountable misses. The same care and nicety should be observed in loading each and every cartridge as would be required in loading the most elaborate muzzle loader. Begging your pardon for occupying your time and space, and hoping that the above hints may be of use to some rifleman,

I remain yours truly,

E. A. PALMER.

JUDGING DISTANCES.

PUTNAM, CONN., March 26, 1877.

EDITOR FOREST AND STREAM.

I have got a notion in my head (strange, don't it?), and you know an ocean must have its own sway, and though it has its tides, yet it will not be tied, and woebetide the man who tries it; *vide* King Canute.

My notion is this: that it would be of no little practical benefit to riflemen if each club should adopt a plan for practice something like this: The captain to select a firing point at some unknown (for certain) distance from the target, from which point each man to fire, say five shots, no man to have the benefit of another's experience; then the captain to select another point, and so on, at as many different distances as they may care to try; the idea being to form an approximately accurate judgment of distance, as hardly any *game* will stand still and let you measure up to it, and if it will, why, you don't need any gun, but simply some salt to put on its tail, which kind of salt you will *not* find in mine ocean.

I am not a rifleman of fifty years' standing, in fact, I object, on principle, to standing as many minutes when I can get a good seat, but I give the above for what it is worth, simply suggesting that the details may be varied to suit each club, the main thing being to learn the rifleman to judge of distance. Yours truly,

O'VERICUS.

[We have always contended that the practice of judging distances should be exercised more by riflemen.—ED.]

SUB-CALIBRE RIFLES AGAIN.

N. S., March 28, 1877.

EDITOR FOREST AND STREAM.

SIR: While conceding the mechanical practicability of the sub-calibre rifle barrel, you say that a gun to which one was fitted would be a nondescript piece of little value. To that view permit me to express, under correction, my decided dissent. To your question, as to where the rifle barrel should be carried when on a long trip and for mixed shooting, let me answer by asking, "What better gun could you have for mixed shooting, than a rifle and shot-gun combined?" My idea was to have only one rifle barrel, though, of course, two could be used, but would make rather too heavy a gun to carry around all day. When only small game was expected, as is generally the case in the Middle and Eastern States, the rifle should be left at home. I regard "Wacautah's" experience as decidedly favoring my views, while that of "Forest i's" proves nothing against them, as the barrels he had may not have fitted accurately and snugly, an indispensable pre-requisite to good shooting, and which can be best done by a large manufacturer, who has the necessary facilities in the way of machinery, etc. In this connection let me quote from the Catalogue of Nichols & Lefever for 1877, which was the firm I alluded to as making the barrels, but charging too much for them. It says, "We insert a rifle barrel into our breech-loading shot guns when desired. This barrel is so constructed that it can be adjusted in a minute, with nearly the same ease as to insert and withdraw the shell. The weight is from 1¼ to 2½ pounds. It takes the same shell that we use in our single and double rifles. *These inserted barrels shoot nearly as accurately as any other rifle, etc.*"

The Baker gun is doubtless very convenient, but we can't all buy these guns in addition to the one we already possess, while, for a small additional outlay, every owner of a B. L. shot-gun may have a good sporting rifle in the most compact shape. I would like to know the ideas of a practical manufacturer on the subject, and hope some of them may be induced to give them. B. L.

EDITOR FOREST AND STREAM.

I notice in your remarks, prefacing my article on sub-calibre rifles, that you ask, "Why not have it a permanent fixture, like the Baker gun?" In reply I will say, that such a gun would be too heavy as a shot-gun. You ask, also, "Where would the rifle barrel be carried?" I answer, in a sheath, and slung like an army carbine. You will notice that I recommend *two* rifle barrels of different calibre (or bore, not *box*), as your compositor made it in two places), and these barrels could be readily carried in a double sheath or scabbard, and slung as stated. In addition to the usual shot-gun sight, each shot barrel should be mounted with a set of rifle sights, and the difficulty complained of by Toronto would be obviated. For fifteen or twenty years past I have argued, that the first company that fitted up for the manufacture of such a combined gun as I describe would get plenty of orders, and I see no reason to change my opinion, providing good work is turned out.

WACAUTAH (not Macantah).

The Kennel.

THE NEW YORK BENCH SHOW.

The arrangements for this event are progressing satisfactorily, and the interest in it daily increases. Not the least notable fact is that many persons who on ordinary occasions would not be known as exhibitors are coming to the front. On Friday last an old gentleman, eighty-two years of age, Mr. H. C. Durell, applied for entry blanks, and will show the setters over which he still shoots with unabated vigor. This is but one instance of many which will give special interest to this show.

NEW YORK, April 2, 1877.

EDITOR FOREST AND STREAM.

SIR—The progress of this show is going on very satisfactorily; the interest manifested by all parties is greatly on the increase, as the applications and entries abundantly testify. Many of those have been received from parties who have never before exhibited at any bench show. The non-sporting classes promises to be quite a feature of the show, as many ladies in New York and adjoining cities will show their pet dogs.

Several additional special prizes have been sent in, which will be classified by the Committee at their next meeting, and at once put in the printer's hands, so as to be ready for circulation the last of this week. Mr. John Davidson, of Monroe, has accepted to act as one of the judges, and probably will be assigned to the classes for English setters. Capt. J. M. Taylor has also accepted. The names of the other judges have not yet been decided on, as the Committee are taking time to secure the most competent men and to divide them into the classes they are most adapted for. Application has been made to the various railroad companies for the free transportation of dogs, the result of which will be announced.

Yours, truly, CHAS. LINCOLN, Supt.

Since the above was written a letter has been received from the Rev. J. Cumming Macdona, accepting the invitation of the Westminster Kennel Club to visit this country and act as judge. He will bring a large party with him. Letters have also been received from many prominent English breeders and exhibitors.

A GOOD IDEA.—The Westminster Kennel Club have made arrangements with the North British and Mercantile Insurance Co., by which any owner, for a trifling sum, may have his dog insured against death by fire or any cause connected therewith. The cost of insurance will be but 25 cents for fifty dollars, or 50 cents for each one hundred dollars. The Company will have a clerk at the Garden on Monday and Tuesday of the show-week to issue certificates, or insurance can be effected through Mr. Lincoln, or by addressing Philip Latourette, Esq., N. B. M. Ins. Co., No. 64 William St.

ROCK.—The St. Louis Kennel Club have sold their renowned setter Rock, to Messrs. J. & R. M. Nesbitt, of Cambridge, Mass. Regarding the purchase, one of our Boston correspondents writes as follows:

"All lovers of the setter will welcome this grand dog East again. The remarkable beauty, fine size, and excellent field qualities now exhibited by several of his earlier whelps, owned in the neighborhood of Boston, seem to indicate that he is just the dog to cross on our natives, and his undoubted success in this line has induced Messrs. John and Robert M. Nesbitt, of Cambridge, Mass., to purchase him from the St. Louis Kennel Club. Many of your readers will recollect the beautiful puppies exhibited at the last Springfield Bench Show by Mr. John Nesbitt, from the bitches "Maud" and "Belle." Both of these litters were by "Rock." Though we understand the Messrs. Nesbitt have bought him for private use in their own breeding kennel, we hope he will not be altogether withdrawn from the public stud. UNDER GRIP.

UNION CLUB—*Boston.*—The gentleman writing from this Club for information regarding entering a valuable setter bitch in the Kennel Register, will have to write his name more distinctly to enable us to comply with his request.

—Mr. L. H. Smith, of Strathroy, Ontario, writes us that his Field Trial setter bitch Dart, whelped twelve puppies to Leicester, on the 23d of March.

—Mr. Avery W. Gore, of Boston, claims the name of Mollie 2d for a white black and tan puppy by Rink out of Mollie, she by St. Kildare, whelped December 8th, 1876, and bred by Isaac Fiske, of Worcester, Mass.

—Capt. Foster's "Kirby" whelped at Leesburg, Va., last week, seven puppies by "Champion Rock."

BUYING DOGS.—We are in receipt of a large number of letters from persons who are desirous of purchasing dogs. To all such, and we would ask of them to accept this as a reply to their letters, we would say that during the coming Bench Show to be held in this city they will find opportunities to suit themselves such as rarely occur. Not only will prices be affixed in the catalogue to all dogs, but on the last day of the show there will be an auction sale, for which a number have already been registered. We shall be happy to execute commissions for any of our corespondents and readers who may be unable to attend in person, particularly for those wanting puppies, as there will be a large number of litters of every breed and strain from which to choose.

—Mr. O. W. Downer, of Brooklyn, claims the name of Grouse and Lassie for a brace of English setters, black and white, with slight tan markings, imported by him.

SETTERS—ENGLISH, SCOTCH, AND IRISH.

BY "STONEHENGE."

WE continue in this issue the republication of Mr. Walsh's paper on Setters, from the London *Field:*

THE BLACK-TAN SETTER (sometimes called Gordon).

The black-tan setter, until the institution of shows, was commonly called "Gordon," from the fact that the Dukes of Gordon had long possessed a strain of setters of that color, which had obtained a high reputation. At the first dog show held at Newcastle, in June, 1859, Mr. Jobling's (of Morpeth) black and tan Dandy was shown with success in an open class; and in November of the same year Mr. Burdett's Brougham followed suit at Birmingham. In 1861 Mr. Burdett's Ned (son of Brougham) won the first prize in an open class at Birmingham, after which a special class was made for dogs of that color at Birmingham, London, and other large shows, the breeders of English dogs fancying that the beautiful color of the "Gordon" was too much in their favor. Up to the above-mentioned period the black-tan setter had not been generally introduced into the midland and southern counties of England—Mr. Brown, of Melton Mowbray; Mr. Burdett, of Birmingham; the Rev. T. Pearce, of Morden; and Mr. Calver, of East Harling, Norfolk, having been the chief breeders in those districts. Mr. Burdett's Ned was a very handsome, useful-looking dog, and was sold at a good price, together with his brother, Rock, to Sir J. Rivett Carnac, of Warborne, Hampshire, by whom they were shot over for two or three seasons. Mr. Pearce won several prizes with Argyll II., Regent, and Ruby at the early shows, but it was not till the appearance of Kent, shown by Sir E. Hoare at the Ashburnham Hall show, London, in 1863, that the strong *furore*, which from that time set in, was displayed. Beating Argyll II., bred by Mr. Pearce (but shown in another name, having been previously sold), he was at once claimed by Mr. Pearce at the selling price (30 guineas), and proved a profitable investment, earning for his owner a large annual income for several years at the stud, and winning several prizes in the champion classes, together with the gold medal at the Paris show of 1865. On the show bench his grand head and rich color drew general attention to him, and it was only to those who could see him out that his rather weak hind-quarters were visible. Taking prize after prize at Cremorne, Birmingham (four times), Islington (twice), Worcester, and Paris, his extraordinary career naturally caused a great amount of jealousy, and he was called by the opposition party a "cur," a "mongrel," a "half bloodhound," and a dozen other bad names. Since that time, however, the real facts of the case have been revealed; and there is little doubt that he was descended on his sire's side from Mr. Jobling's kennel, and on his dam's from that of Mr. Adamson. He was bought when a puppy by Sir E. Hoare from an old rabbit-catcher on his estate, who had brought him up under a cat. Probably to his early confinement and bad-rearing may be attributed his weak hind-quarters. So convinced, however, was Mr. Pearce of his purity of breeding, that he determined to put the matter to the test of experiment, and offered to trust one of his stock out of Regent to the care of the writer of this article, to be brought up where he could not possibly see game, and at the proper age—namely, nine or ten months—to be introduced to it without previously being entered to it in any way. The result was in accordance with Mr. Pearce's prophecy, for the puppy not only beat his ground in fine style, but at the end of a few hours' work began to stand his birds as only a well-bred pointer or setter will do, without any artificial education of any kind. Of course the report of this trial added greatly to Kent's reputation, and being followed by the successes of Rex (the above puppy) at Stafford and Shrewsbury, where he won three cups, beating in the final trial Mr. Field's Duke, who had gained a high reputation in previous years, Kent had so strong a run at the stud for several years, that it would be difficult in the present day to find a black-tan setter without a strain of his blood. Mr. Pearce's Regent had several large litters by him, including Rex, Young Kent, Iona, La Reine, Dame, Deal, and Silk—all winners at shows or field trials. Mr. Stoke's Shot, successful at Birmingham and Islington in 1868-9, was out of La Reine; and Mr. J. H. Salter's Young Rex, winner at Brighton in 1876, is by Rex.

But, in spite of the above successes, it cannot be denied that the general opinion of good sportsmen in the south has not been in favor of the breed since the institution of field trials, in which it has been brought into competition with the English and Irish setter. Both Rex and Young Kent had shown marvelous powers of scent, but exception was taken to their tiring action, and it must be admitted that six hours' work was enough at one time for either of them, and probably too much for Young Kent. Both dogs also were headstrong, and required severe treatment to keep them under command, and though neither showed the slightest disposition to unsteadiness on the point, yet both were jealous behind, and it was difficult to make them work to hand. Among the numberless specimens of the breed (black-tan) which I have seen at work, not one has shown the solicitude to catch the eye of the shooter which is so essential to the perfect correspondence of man and dog which ensures sport. The pointer or setter ought always to know where his master is, and if put into high covert, such as beans, should raise his head at short intervals above them to ascertain his whereabouts. Now, as far as my experience goes, black-tan setters, and notably the Kents, never do this, and cannot be taken off a scent, without very great severity, till they have satisfied themselves of its fallacy. Most of those tried in the field have been dead slow, including Mr. Stoke's Shot, Mr. Purcell Llewellyn's Wick, and Mr. Furner's Dorset; but

Lang, by Reuben, was fast enough for anyone, though not showing much nose, while Young Kent displayed fair pace, and Rex was far above the average in this respect. On the whole it may be said that the verdict has gone against the breed in England, and as far as I know, no breeder of experience in the south adheres to it, with the exception of Mr. J. H. Salter; nor is it much more approved of on the moors by the general public.

The *points* of the black-tan setter are very nearly the same as those of the English dog, the only deviations being as follows:

1. The *skull* is usually a little heavier than that of the English setter, but in other respects it resembles it.
2. The *nose*, also, is like the English setter; but it is usually a trifle wider.
9. The *flag* is usually a trifle shorter than that of the English setter, which it otherwise resembles in shape.
11. The *coat* is generally harder and coarser than that of the English or Irish setter, occasionally with a strong disposition to curl, as in the celebrated champions, Reuben and Regent.
12. The *color* is much lighter on the black should be rich, without mixture with the tan, and the latter should be a deep mahogany red without any tendency to fawn. It is admitted that the original Gordons were often black, tan, and white; but, as in all our shows the classes are limited to black-tan, the long arguments which have been adduced on that score are now absolete. A little white on the chest and a white toe or two are not objected to; but a decided frill is considered by most judges to be a blemish. The red tan should be shown on lips, cheeks, throat, spot over the eyes, fore legs nearly to the elbows, hind legs up to stifles, and on the under side of the flag, but not running into its long hair.

PEDIGREE OF COLBURN'S DASH.

EDITOR FOREST AND STREAM.

I notice in your issue of March 1st the fine portrait of Colburn's "Dash." In looking over his pedigree I find a great error—where it reads "Mead's Dash," by Dash, out of "kent bitch, reddish red." Now, sir, there has been, during the last few years, quite a controversy in the sporting papers in regard to the pedigree of Paul Mead's "Dash," sire of Rodman's Dash. I supposed, at the time, that these articles would attract the attention of Mr. Johnston, the breeder of Mr. Mead's Dash, and induce him to come out with a statement, in order to correct the different views of several writers, and give the sporting public the true inwardness of the pedigree of this fine breed of dogs. Their progeny are now scattered all over the country, whose owners would be greatly gratified to see this mysterious veil lifted, and bring to light, not alone the full pedigree of the sire of Mr. Mead's "Dash," but also the dam of the last-mentioned dog. Mr. Johnston certainly owes to the sporting world the full history of this strain. Many erroneous rumors have been sent afloat in regard to Paul Mead's Dash; but I say, without any hesitation, that all these rumors are without any foundation whatever. At the time that Mr. Johnston was in possession of his imported Irish bitch, "Jenny," I often met him on the snipe patches and stubbles of Long Island. I became thoroughly acquainted with Mr. J., and found him to be a genial, jovial, and unpretentious sportsman of the old school, hospitable and charitable to a fault, who was ever ready to acknowledge everybody's dogs to be better than his own. At this time I saw in his kennel the young Irish setter pup, afterward the well-known Paul Mead's "Dash," and his full sister, "Kate." Jenny, the dam of the above dogs, I believe, was never broken in the field. Mr. J. informed me that he only imported her for breeding purposes, her strain being well known to him in Ireland, being of true blue-blooded Irish stock. Jenny was a low, long, straight-haired, deep mahogany red, with a fine, clean cut head, pendulous ears, set rather low for an Irish dog. Her hair was very coarse, but very glossy. She was well ribbed up, full in barrel, and deep in chest. Her great fault was her neck, which was rather short and thick. Her type is well stamped on many of her progeny. After breeding several litters of pups from her, Mr. J. sold, or presented, her to a Mr. Frank Distler, who was owner of her until her death. "Kate," the full sister to Mead's "Dash," was broken by Mr. Benjamin Kent, one of the best dog breakers in those days. She was very small in size, but well put together, a merry worker, and very stanch on all game. Mr. Kent finally sold her to a bird fancier—a Mr. Valentine Kunkle, now residing on Rivington Street, near Pitt Street, New York City. All the connection Mr. Kent had in regard to Jenny was, that he took her to Albany to have her lined by a fine imported Irish dog of rare quality. This last-named dog was the sire of Mr. Paul Mead's "Dash."

Should this letter meet the eyes of my old friend, "Andy," who has retired from all business to devote his last days to the gun and rod, we beg him to come forth, and give us the full pedigree of the finest breed of Irish setters that was ever bred in this country. G.

CONSUMPTION CURED.—An old physician retired from active practice, having had placed in his hands by an East Indian missionary the formula of a simple vegetable remedy for the speedy and permanent cure for Consumption, Bronchitis, Catarrh, Asthma, and all Throat and Lung affections, also a positive and radical cure for Nervous Debility and all nervous complaints, after having thoroughly tested its wonderful curative powers in thousands of cases, feels it his duty to make it known to his suffering fellows. Actuated by this motive, and a conscientious desire to relieve human suffering, he will send, free of charge, to all who desire it, this recipe, with full directions for preparing and successfully using. Sent by return mail by addressing with stamp, naming this paper, Dr. J. C. STONE, 32 North Fifth Street, Philadelphia, Pa.—*Adv.*

Sea and River Fishing.

*** For trout flies in April, see our issue of March 29th.

FISH IN MARKET.—Fish of all varieties continue scarce, with but moderate change in prices. Our quotations for the week are as follows: "Striped bass, 20 to 25 cents per pound; smelts 15 to 20 cents; salmon (frozen), 25 cents; California, 25 cents; shad (Southern), 50 cents each; native, do. $1.50; white perch, 15 cents; Spanish mackerel, 50 cents; green turtle, 20 cents; terrapin, $15 per dozen; frostfish, 8 cents per pound; halibut, 15 cents; haddock, 8 cents; codfish, 14 cents; blackfish, 15 cents; herrings, 6 cents; flounders, 10 cents; sea bass, 20 cents; eels 18 cents; lobsters, 12 cents; sheepshead, 20 cents; turbott, 20 cents; scollops, $2 per gallon; whitefish, 15 cents per pound; pickerel, 15 cents; Canada brook-trout, 25 cents; Long Island trout, $1; trout, 50 cents; pike, 10 cents; ciscoes, 10 cents; hard shell crab, $4.00 per 100; red snappers, 18 cents.

—The Germantown *Telegraph* says:

"Some fishermen, who are not troubled with a conscience, go to work, after making their hauls, to stuff the throats and stomachs of large rock-fish with small, unmarketable fish, in order to make the former weigh heavier. All fish except shad are sold in this city by weight, and rockfish treated as above are often received here. Dealers say that the fish thus unnaturally extended do not keep fresh for as long a time as when undisturbed."

What naughty men!

—The first shad of the season were taken in the North River, New York, last week, which is unusually early for these waters. Of late years they have rarely been caught before the middle of April, though last season a single fish was taken on the 5th of that month.

—Nineteen vessels, 12 being steamers, have left St. John, N. F., for the fishery. Harbor Grace also sends 19 vessels. Cod-fishing on the western coast of Newfoundland is reported good.

FISHING NOTES.—The dull weather the past week has left its impress upon the fishery, and a light catch has been the result. This, together with the fact of there being no opportunity to get fish in marketable condition, has operated unfavorably in that direction, and it may emphatically be termed a dull week for the fishing interest. Orders have been light, and most of the new stock in merchantable order is on the market waiting for a demand. The stock is not heavy for the season, and holders are anticipating that revival of business which shall give an impetus to the fish trade in common with other branches.

The number of fishing arrivals reported at this port the past week has been 39—4 from the Banks and 35 from Georges. The fish receipts have been about a million pounds of codfish and 350,000 lbs. halibut.—*Cape Ann Advertiser, March 30th.*

BLACK BASS.

BOSTON, March 26, 1877.

EDITOR FOREST AND STREAM.

As numerous interesting articles have periodically appeared in your valuable sheet, tending to establish the fact of the affinity between the black bass and the artificial fly, I have been tempted to enter the list as an advocate of the artificial allurement when angling for the same. The theory that they will not take the fly was, in my opinion, *honestly* formed by anglers who have confined the indulgence of the sport to certain waters *only*. It has been satisfactorily demonstrated in my own case that in certain ponds and lakes known to abound in bass in the State of Massachusetts they cannot be tempted with the gaudy bait, while minnows, grasshoppers, and especially crickets, are eagerly taken. Too much cannot be said in praise of the last-named bait. They should be as large as possible, in which case one will answer for a bait. If small, two or more can be used. Having tried minnows, grasshoppers, worms, small fonds, and other natural baits for the past three years, I concede the palm to the cricket as the insect best calculated to lure the bass to the cruel of the hungry angler.

But, Mr. Editor, I am wandering from the subject of fly-fishing, which was my object in addressing you. One of our finest lakes, which has been stocked with black bass for the past eight years, has been the scene of many unsuccessful attempts on my part to take them with the fly. While I have seen hundreds taken with natural bait, I have never seen or heard of one being taken with the artificial-fly. I am unable to account for this, or learn any satisfactory theory for this delicate discrimination on the part of the black bass. I mention the above circumstance in support of my theory, that those who have not succeeded in taking them with a fly may have confined their experience to limited waters *only*, and formed their opinion from the unsuccessful results.

Upon a stocked pond, in Lincoln, Mass., in August last, I experienced one of the most successful fly-fishing excursions which I ever took part in. The day was very bright and warm, and we first proceeded to the shady portion of the pond on the easterly side, where we spent the morning in bait-fishing with good success, the result, at noon being ten bass, ranging from one and three-quarter pounds to two and a half pounds. This did not include all that were taken, as, by request of the proprietors, all weighing a pound or less were returned to their native element. After spending a liberal amount of time at noon for lunch and digestion, we again entered our boat and pulled across the pond, where I rigged my eight-ounce Leonard rod, much to the amusement of my skepical companion, who desired to know "if I came out for *exercise* or *fish*." Not being certain of success I bore the insinuations with that patience which is indispensable in an aspirant for game in angling. Carefully I attached my six-foot leader, using for a stretcher (fly) a good sized red ibis, and for droppers a red ibis of smaller size and the Jenny Lind fly, which I purchased of friend Prouty, at Bradford & Anthony's. My fourth cast was successful in fastening upon a two-pounder of exceedingly lively traits of character. This was my hour of triumph; could I but safely land him, I would willingly forgive my crest-fallen companion for the aforesaid "mild insinuations." Suffice it to say that the feat was accomplished within the space of five minutes, and a revolution had taken place in the contemplative mind of my genial friend. Others were taken also, of good weight and pluck, but the summit of my bliss was reached at about 6 o'clock, when my stretcher fly was taken by a gamy fellow of one and three-quarter pounds weight. After his first leap he ran off about twenty feet of line, when I felt something which led me to believe a commotion was taking place beyond my range of vision. How my blood begun to take new life when I saw my first acquaintance again leap, but this time with a companion upon one of my droppers, which subsequently proved to weigh two and three-quarter pounds. Fifteen minutes elapsed ere I had them both safely in the boat, much to my own satisfaction, and the conversion of my friend to my theory of taking these fish with the fly. This closed our day of sport, and a most satisfactory one it was. The total amount taken must have reached nearly fifty pounds, and many were returned to the pond. During the same month I took several with a fly from Massapong Lake, in Sharon, ranging from one-half pound to four pounds.

I do not desire to further encroach upon your space, and will close with the hope that others will give their experience to eradicate any doubt upon the subject of successful fly-fishing for the black bass, and to encourage this mode of taking them. In my opinion, there is no fish of the same weight which furnishes more genuine, enthusiastic, and exciting sport than that great promoter of health—the black bass. A NEW SUBSCRIBER.

AQUADALE PONDS, Wenonah, N. J., March 26th.

EDITOR FOREST AND STREAM.

I was surprised to read in your last issue the article of your Philadelphia correspondent, THE HORATH, and not find one line or word of editorial rebuke. Your correspondent says he commenced fishing for bass early in May, and continued till late in September. From the location named, I take it for granted that he refers to the black bass, whose active breeding season is during the months of May, June, July, and August, some old fish spawning earlier, while yearlings spawn as late as September. As the black bass remains constantly on its spawning-bed till the young are large enough to take care of themselves, and subsists upon such food as comes to it, they can readily be taken with fly or bait—more easily with the latter—during this, their essentially hungry period. From the depth of water and location mentioned by your correspondent, there is no doubt about nearly if not quite all the bass taken by him being taken from their spawning-beds, thereby destroying hundreds of thousands of embryo bass. MILTON P. PEIRCE.

THAT ARTIFICIAL "WUM."

OTTAWA, Canada, March 19, 1877.

EDITOR FOREST AND STREAM.

In your last issue I saw a notice of an "artificial angle worm," and you state that it has been patented; that it can also be used as chewing-gum. Now, Mr. Editor, my motive in writing this is to warn my brothers of the angle, that no matter how toothsome the said worms are to the fishermen, they are not to the fish. I have tried them, or rather I have tried to induce fish to, but never succeeded. They are by no means a new thing. They have commonly been sold by English fishing-tackle makers for many years. I bought some more than twenty-five years ago, and never caught a fish with one, and I know my experience of them has been that of others; they are a delusion and a snare, and, like Paddy's razors, that were made to sell, not to shave; they are made to catch dollars, not fish. When a fish takes a worm, he does it quite as leisurely as an old woman does a cup of tea; for he (the fish) knows when a worm falls into water he is sure of him—that is to say, if no other large or more nimble fish than himself are close by; therefore, more senses are brought into play than that of sight, and the close observation of a motionless object, aided by touch, smell, and taste, precludes any possibility of the fish being deceived. If only the sense of sight had to be overcome, and the worm could be used when in more or less rapid motion, in the same manner as artificial flies, minnows, or fish, that are pursued by sight only, and secured by a rapid rush, so that no other faculty was allowed the fish, it might be a success; but as a still bait, never—not even when allowed to drop down to the bottom of a rapid stream. As an imitation of a worm they are perfect, not only in color and soft pliability, but they have the corrugated rings distinctly marked, as in the natural worm, and look to the eye all that a worm should look; but they have no more taste or smell than a wooden nutmeg or bass-wood ham. L. BREWI.

[Our correspondent will accept our thanks for his article. It will be seen, by reference to what we wrote, that we did not recommend the bait. It does not follow that we indorse all that we print, though we generally prefer to give our opinion.—ED. F. AND S.]

WINDSOR, March 14, 1877.

EDITOR FOREST AND STREAM.

Fenton, of No. Four, in a letter dated March 11th, says: "Snow two feet deep; have had fine weather since the middle of January. Hundreds of deer have been slaughtered in the deep snow, but none in my immediate vicinity. February 14th deposited 20,000 salmon-trout and 15,000 whitefish spawn in Beaver Lake; hope to be able to put in more next year. Wardwell goes back again to his house at Stillwater in April, which will please all who go into the wilderness by this route. Carl Hough and Luke Hammond killed a huge bear, which they found in his den. Hough has wintered at South Branch alone, doing some considerable trapping."

The young salmon that were put into the Farmington River at Windsor are being killed by the hundreds by the paper mills at Rainbow and Proquonock. They are some six inches in length, and were doing finely. It seems a pity that something can't be done to stop the mills from draining their filth into the river. What fun we might have in a few years with the fly, and so near, too. F. BOLLES, JR.

ATLANTIC YACHT CLUB.—At the last meeting of the Atlantic Yacht Club, held on March 12th, which was the annual meeting, an unusually large number of members were present. The following gentlemen were elected to membership: Richard Arnold (yacht Mab), Thomas P. Fiske (yacht Genia), Austin H. Eaton, and George A. Price. The annual election resulted as follows: Commodore, George A. Thayer; Vice-Commodore, Wm. Cooper; Rear-Commodore, Wm. Hildrath Field; Recording Secretary, John B. Morgan; Treasurer, Wm. H. H. Beebe; Measurer, C. T. Lippitt; Corresponding Secretary, J. Lawrence Marcellus; Trustees, G. A. Thayer, Wm. H. H. Beebe, J. R. Maxwell, L. A. Fish, John H. Rhodes, W. W. Beebe; Committee on Membership, A. H. Farrington, W. W. Richards, E. L. Maxwell. The following gentlemen were elected as the Regatta Committee: C. T. Lippitt, F. T. Peet, H. S. Manning. Date of regatta, Monday, June 11th. Course for each class the same as last year.

A vote of thanks was tendered to Mr. S. W. Knowles, the retiring treasurer, for the very able and efficient manner in which he had managed the finances of the club.

Mr. W. H. H. Beebe, on behalf of Capt. J. R. Bush, presented to the club a beautiful framed photograph of the yacht Madcap, and the following resolution was thereupon adopted:

Resolved, That the thanks of the club are eminently due, and are hereby tendered to Capt. J. R. Bush for his kindly remembrance of the club, in presenting them with a beautiful picture of the Coriuthian race between the yachts Madcap, Active, and Windward.

Mr L. A. Fish gave notice of his intention to offer at the next meeting the following amendment to Chapter I, section 1, of By-Laws: to insert the words 'and Measurer" after the word "Chaplain" in the last paragraph of the section, thus making the Measurer as well as Chaplains exempt from the payment of dues.

The affairs of the club in all respects were more favorable than at any previous annual meeting, and good fellowship and kindly feeling were manifest in all that took place.

—The yacht Peerless, having on board her owner, Mr. Roger Maxwell, and a party, will start early this month on a duck-shooting expedition to the Thimble Islands, in the Sound.

—Mumm, of Brooklyn, is building a 21-foot boat, 9 ft. beam, for Dr. Eldridge, of Yarmouth, Cape Cod. The boat is to draw but fifteen inches of water.

—James Smith, foot of Court Street, Brooklyn, is building a catamaran, or double boat, after the model of Mr. Herreshoff's, which is to be 45 feet long, for a gentleman of Staten Island.

EASTERN YACHTING NOTES.

[FROM OUR OWN CORRESPONDENT.]

BOSTON, March 27, 1877.

A regatta of the Mosquito Fleet, under private superintendence, is to come off at City Point, South Boston, Fast-day, April 12th, wind and weather permitting. All entries are free and must be made with Ex-Commodore Wright at the Atlantic House. The first-class comprises all centre-board boats 14 feet and under; second-class, all keel boats 12 feet to 14 feet; third-class, all keel boats under 12 feet.

As the pleasant occasion is a repetition of last year's successful trial, it is looked forward to with much interest, especially as most of the boats are tenders to the different yachts, and are sailed principally by their owners. In last year's performances Maj. McDonald's Lizzie showed herself remarkably smart, and did credit to her owner and builder. The Marquita's tender (a little boat from New York) took second prize. To an observer it seems almost impossible for so small a craft to carry such large sails. You might take the boat and wrap her up so that nothing would be seen of the hull in the canvass she flies. We wish the adventuresome ones luck.

The Violet, Capt. Frank Peabody, has put in an appearance this evening, thus eventually opening the yachting season in this part of the country for 1877.

Frank Weston, Esq., has just bought the schooner Mist. She will be entered on the lists of Boston and Dorchester clubs. The Mist has very fine accommodations, but her speed has never been tested.

THE NAHASSET YACHT CLUB.—The annual meeting of this club was held at the Parker House, March 31st. The following officers were elected for the ensuing year:—Commodore, T. Daland; Vice-Commodore, Arthur Burgess; Secretary and Treasurer, J. P. Hawes, Jr.; Fleet Captain, Henry Bryant; Measurer, Henry G. Hall. Regatta Committee: T. Daland, John Bryant, P. Grant, Jr., W. C. Hasken, J. P. Hawes, Jr. Membership Committee: L. C. Fenno, G. P. Upham, Jr., Arthur Burgess, J. C. Minot, J. C. Sharp, Jr. The club is in a very prosperous condition.

The schooner-yacht, "Elsie," was launched here this week, as were several sail boats. The yachting fever has begun to spread, and much activity is being seen in yachting circles. The sloop "Iris," that was run into in Hull Gut by a steamer two or three years ago and has since been laid up, was sold to some parties in South Boston, who have given her a thorough overhauling, and she will go into water this year in better condition than ever before. Her cabin has been raised up and finished in hard wood. Many new timbers have been added to her frame, and she will be staunch and strong.

It is rumored that the little sloop "Wanderer" has been sold to parties on Lake Champlain.

The fishing boats that have been hauled up on the beach all winter are being launched very fast; they will probably all be in the water by the middle of the month.

KEDGE.

AMATEUR CRUISING.

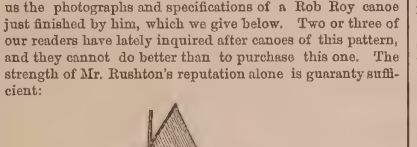
FROM BOSTON TO NEWPORT.

EDITOR FOREST AND STREAM.

A beautiful, still morning the 6th of July found five jolly fellows on board the little schooner "Josephine," ready for a cruise along the South Shore. At 6 A. M. the moorings were cast off, and with the well wishes of our friends we glided out of Boston Harbor, favored by a gentle land breeze from the southwest. Our course was laid for Scituate, where we intended adding to our number one more.

Before proceeding further, it might be well to give a description of our little floating home. I will also say, in explanation, that if any readers of this article profit from our experience, much will have been gained in writing it. Our idea in getting the boat (the way I shall hereafter describe) was to save as much expense as possible, and we made a decided hit; but we also made a great mistake. After many inquiries and much trouble, we found that we could buy this schooner for $475, and have something to show for our money after the trip was over; otherwise, we would have to hire a boat and skipper, and pay enough to buy a boat. To make a long story short, we paid the money down and owned the craft. Our first mistake commenced in not getting some one to do the chores. It is seldom you can get five or six good follows together to labor and pay expenses for any length of time. At first it was fun; after that it became work. "A new broom sweeps clean," and it is only when the new is worn off that you experience the result. I am going to give this plain and unvarnished, hoping others will get rid of very unpleasant times by our experience. We made a mistake in not having a skipper to look after the boat, and also in not hiring a man to cook and clean up. But I will also say, that when you do get chums together that are willing each to do their share you will have a very pleasant time. Instead of employing some one to do our work, we determined to utilize the talent in our midst.

The boat (nautically speaking) was a tub. She was built by the government for a harbor police boat, and was, one of those ugly conundrums "dat no mens vinds out." She was planked outside like any ordinary boat, but was cross-planked inside—for what purpose I could never tell, unless to furnish a contractor with funds, or else use up superfluous government lumber. Her dimensions were—length over all, 29 feet; beam, 10 feet, with a draft of water aft of 6 feet. Her cabin was plain and commodious, and she had a nice cook-room or forecastle. She was like a family horse—slow, but sure.



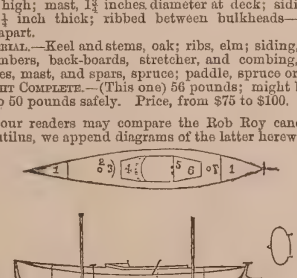
Our mess consisted of Mr. H., who aspired to be captain; for short we call him Bill (hence Captain Bill). The next was Mr. W. E. N., an artist, who had earned his title of "Knight of the Brush." We will call him Ned, and give him position as mate (hence mess-mate). Third on the list, Mr. M. M. stands for music, and a jolly fat roll of music he was, of over 200 pounds weight. I have seen him play the piano with one hand and organ with the other at the same time. The fourth position was filled by Mr. B. We will call him Charlie. He was partly an invalid, but was full of fun and quaint humor. The fifth place was filled by your humble servant—did I say filled? I correct myself. It would take five more just like me to fill the position as cook for such a crowd—always eating, always hungry. But as there was no one to do the cooking, and no one in our party but myself that knew anything about such artistic life, I of course had to volunteer, and dat's vere I made me mishdake. I ought to have played ignorance. "When ignorance is bliss, 'tis folly to be wise." Every one seemed to think that if you did the cooking, of course you must wash the dishes; and if there is one thing I hate above all others it is washing dishes.

But all this time I have been explaining for your benefit, dear reader, we have been drifting out to sea on an ebb tide. The gentle zephyr we had had on the start had died away, and to make our position as comfortable as possible, the sun burst through the smoke and haze and made the water glassy and tiresome to look at, only relieved by the occasional flitting of a swallow or Mother Carey's chicken. From the warnings of the inner man I went below to find a lunch. After rumaging over sundry packages, I brought to light some crackers, cheese, and sardines, which, with a cool lemonade, made a good quieter of appetite. Our party was strictly temperate, only one ever using tobacco. I don't believe one of us would have looked cross-eyed at a glass of whiskey or milk-punch, for the chance given to Mr. Morton, Jr., *hol!* as the day was! After washing down our feed with copious drafts of lemon-juice we took observations.

In our hurry of getting underway many things were neglected. We divided the mess—one part took the cabin, the other the decks, and in half an hour you would have thought we were old salts from the order and neatness.

The wind sprang up again from the old quarter, but we had gone so far to leeward in the tide, we could hardly lay our course. Giving her a good bull, we let her bile for over an hour. As we passed by Minot's light, we could see the huge rollers break on the black ledge off Cohasset. Tacking in shore, we laid for the "Glades" (a wilderness of wild rocks south of Cohasset). On nearing shore the wind came in spiteful puffs, hot as air from an oven, and compelled us to take in our staysail. At times we could only have half a turn on the jib-sheet. Being very round on bottom and full, she made almost as much noise as a ship. The tide was now on the flood and the water began to be choppy, occasionally we would get the spray by the bucketful and it was cool and refreshing. About 4 P. M. we anchored in the mouth of Scituate Harbor, waiting for a tide to go over the bar. The bar runs from the old light to a bluff almost south, and is dry at low water. As we had some time to wait, we fished for "cunners," or perch, and caught a number of large ones. A fisherman told us the direction to go in, "Keep the barn on the hill in sight until you open the spindle on the land, then run in where you see the large boats lay." We followed his advice, but after getting our mud-hooks down, we felt uneasy about our position. A small boy, rowing by in a dory, gave us the pleasant information, we would be aground at low-water, but an obliging native of more mature years said we were all right. I have often wished I could make, his acquaintance under similar circumstances. Hungry as sharks, we dined on fried perch, potatoes, broiled steak with stewed tomatoes, hot corn cake, and capped off with two heaping plates of griddles. Being very tired, we slept sound, only to be rudely awakened. KEDGE.

A BEAUTIFUL CANOE.—Mr. J. H. Rushton, of Canton, St. Lawrence County, New York, well-known as the builder of thirty-five pound cedar boats for Adirondack service, has sent us the photographs and specifications of a Rob Roy canoe just finished by him, which we give below. Two or three of our readers have lately inquired after canoes of this pattern, and they cannot do better than to purchase this one. The strength of Mr. Rushton's reputation alone is guaranty sufficient:



DIMENSIONS.—Length, 14 feet; beam, 26 inches; depth, 8½ inches; rise of deck, 2 inches; bulkheads, 3 feet from each end; cock-pit, 3 feet 4 inches by 18 inches; combing, 2 inches high; mast, 1⅜ inches diameter at deck; siding and decks, ¼ inch thick; ribbed between bulkheads—ribs 1½ inches apart.

MATERIAL.—Keel and stems, oak; ribs, elm; siding, decks, deck-timbers, back-boards, stretcher, and combing, cedar; gunwales, mast, and spars, spruce; paddle, spruce or ash.

WEIGHT COMPLETE.—(This one) 56 pounds; might be built down to 50 pounds safely. Price, from $75 to $100.

That our readers may compare the Rob Roy canoe with the Nautilus, we append diagrams of the latter herewith:

—The regulations for playing upon the parade ground at Prospect Park, Brooklyn, have been revised, and Mr. Charles Hunt, the efficient superintendent, has been directed to strictly enforce the following: "Hereafter no person shall be permitted to play except regularly formed clubs, nor allowed to occupy the grounds, without first having secured a permit—either from Chief Engineer John Y. Culver or from Police Headquarters.

—The weather last week prevented ball playing up to Saturday, rain and snow presenting barriers to field practice, greatly to the disgust of the hundreds ready to take the field.

National Pastimes.

ROLLER SKATING.

—This American exercise has recently been revived in the Metropolis under circumstances which will result in its establishment as a permanent recreative institution of the country, as it should be, for it has everything to commend it, alike in a sanitary as in a moral point of view, and its social attractions are such as specially to give it favor with the best class of society. There seems to be an impression prevailing in one quarter that it is a French amusement, judging from the character of the announcements made of special entertainments at the Brooklyn Rink. But the exercise is one which was first introduced here and then exported to Europe, where every skate used in the rinks of England and France are of American manufacture, the Plimpton patent skate being the only article now in use, either in Europe or America.

The sport has recently found great favor in Brooklyn, and as we are soon to have a fashionable skating rink established in Madison Avenue in this city, it will soon be equally popular here with the wealthy class of metropolitan society. In Brooklyn, besides the Rink in Clermont Avenue, there is now the large ball-room at Gallatin Hall, on Fulton Avenue, and Burnham's Gymnasium Hall, on Smith and Schermerhorn Street, devoted to roller skating; and the large building, Apollo Hall, in the Eastern District, is being transformed into a roller-skating resort. The square known as Leffert's Park, which has been the source of annoyance to the residents of the vicinity, owing to its having been the resort of rowdy pic-nic clubs, has been leased for a series of years, to be changed into a large garden and roller-skating resort for out-door use in the summer months.

BASE BALL.

—At the annual meeting of the National Asso iation of Amateur Base-ball players, March 15th, the following officers were elected for the ensuing year: President, J. G. H. Myers, Flyaway Club; Vice-President, J. L. Brooks, Mutual Club; Secretary, J. M. Tracy, Jasper Club, of Manhattan College; Treasurer, M. J. Dillon, New Rochelle Club; Judge Advocate, J. C. Shea, Monticello Club.

—Among the most important acts of the League Base-ball Convention recently was the adoption of a formal agreement, signed by the clubs, the main feature being that each club should use a self-registering apparatus connected with a turnstile, to indicate exactly how many persons go into each ground for each game. For every person who enters the ground, except players, policemen in uniform, and ten other persons, the visiting club shall receive fifteen cents.

—The Hartfords had a closely contested practice game on the Capitaline Grounds on March 31st. The attendance of spectators was not large, as the weather was chilly. The fielding was poor and the pitching wild. The score was as follows:

Hartford	1	1	2	1	0	0	1	0	0	2=8.
Field	0	0	4	0	0	0	0	1	1	0=6.

The Hartfords were short the services of Allison and Start, Knowdell catching for Larkin, and he did his work well.

—The Live Oaks, of Lynn, Mass., are to inaugurate a new departure this year by admitting ladies free, and having the grand stand covered for their comfort. The uniform of the team will be the same as last year. The club will play with the Tecumsehs, in Canada, May 24th, and the latter club will return the game in Lynn, Decoration Day, May 30th.

—On March 29th the West End Club played a game with the St. Louis Browns, ending with the following score.

West End	0	1	0	0	0	0	0	0	0	0=1.
St. Louis	0	0	0	0	3	0	5	1	0	0=9.

Umpire, Dehlman; earned runs, none. The new Chicago man, Finley, is only a gate man, and not a player of any note. It was one of Spalding's jokes on the newspaper people.

—The annual meeting of the New Jersey Amateur Base-ball Association for 1877, will be held in New Brunswick on the 18th of April. Clubs desirous of joining should address the president, James C. Shea, 139 Monticello Avenue, or Thomas Cummings, Treasurer, 614 Communipaw Avenue, Jersey City.

Tiffany & Co., Silversmiths, Jewelers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their timing watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. Tiffany & Co., are also the agents in America for Messrs. Patek, Philippe & Co., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Bronzes and Artistic Pottery is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. Union Square, New York

G. W. Simmons & Son,

32 to 38 North St., Oak Hall, Boston, Mass.

"THE BOSTON SHOOTING SUIT.—One of the most successful manufacturers of Waterproof Shooting Suits is the firm of G. W. Simmons & Son, Oak Hall, Boston. We had one of their suits on duty at Hunter's Camp at Philadelphia Centennial Exhibition It has grown gray in service, but is good for use yet. This suit is known as the 'Boston Shooting Suit,' in contradistinction no doubt, from the garments which are manufactured out west and at Washington, each of which has a local demand of its own.

The Boston Shooting Suit.'

MANUFACTURED ONLY BY

G. W. SIMMONS & SON,

Boston, Mass.

SOLD everywhere in the U. S. by all first-class dealers in

SPORTSMEN'S GOODS.

EACH GARMENT DISTINCLY MARKED

"BOSTON SHOOTING SUIT," made by C.W. Simmons & Son.

This new design of WATERPROOF SHOOTING SUIT, made from extra quality duck, has attained such popularity as to be called for from all parts of the country, and even from England.

"Shipping clothing to England strikes us very much like sending 'Coals to Newcastle,' but the merits of the "BOSTON SHOOTING SUITS" have been heard of in the Old Country, and that land of sportsmen has sent an order to Messrs. Simmons & Son, which will doubtless be followed by many others."—*Boston Paper.*

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is water-proofed by a new patent process. The seams and pocket corners are securely fastened, and nothing neglected to render the suit perfect in every respect.

THE PRICE HAS BEEN FIXED AT $13, TO INCLUDE HAT OR DOUBLE VISORED CAP, DETACHABLE HAVELOCK, COAT, VEST, AND PANTALOONS.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, waterproof quality and capacity. The coat is a marvel in this latter respect."

PERSONS ORDERING FROM A DISTANCE NEED SEND ONLY THE FOLLOWING TO BE SURE OF A PERFECT FIT:—

BREAST MEASURE.
WAIST MEASURE.
INSIDE SEAM COAT SLEEVE,
INSIDE SEAM PANTALOONS.
SIZE OF HEAD.
MENTION HEIGHT AND WEIGHT.

Offer their usual extensive assortment of STAPLE GOODS, and are introducing this season some NEW and DESIRABLE articles. We call attention to the

PATENT ADJUSTABLE FLOATS AND ADJUSTABLE SINKERS,

which can be attached and detached at will, without knotting or tying the line, or removing the bait or hook. Can also be moved readily on the line, and remain fixed wherever placed. These are rapidly taking the place of the old-fashioned floats and ringed sinkers.

SPLIT BAMBOO FLY RODS from $15 to $50 each.

We make a specialty of Artificial Flies. Our stock is unequalled in variety and extent, and unexcelled in quality.

BRADFORD & ANTHONY received the award of the U. S. Centennial Commission in 1876 for "Exhaustive Variety of Anglers' Apparatus, especially HOOKS, LINES, RODS, ARTIFICIAL FLIES, * * of the BEST QUALITY."

Our Illustrated Wholesale Catalogue of Fishing Tackle will be mailed to any dealer whose address is sent to us. 5aplt

"SPRING."

ALL those who sing of "gentle spring,"
Its many charms revealing,
Had better try and tell us why
Its faults they are concealing.
They may be right to keep in sight
The things that give us pleasure;
To paint the rare in earth and air,
The skies when they are azure;

But don't forget we're living yet
Where storms are ever rising;
Where "gentle spring" will often bring
Us weather that's surprising.
Now you may fly beyond the sky,
Where you delight in flying,
And leave behind the dust and wind,
And us poor mortals sighing.

But you'll alight some stormy night
In this most lovely season,
When bois'trous March will take the starch
Out of your very reason.
There is no doubt you've oft been out,
When wind and dust together
Would blind your eye and make you sigh
For some more pleasant weather.

Now I, forsooth, would tell the truth,
As nature it discloses,
And paint aright the dark, the light,
The thorns as well as roses.

C. P. Field.

For Forest and Stream.

The Rock Camp.

"What should we speak of,
When we are old as you? When we shall hear
The rain and wind beat dark December, how,
In this our pinching cave, shall we discourse
The freezing hours away? We have seen nothing."
—*Cymbeline*, act 3, scene 3.

"Well, 'tis done;
We'll hunt no more to-day, nor seek for danger
Where there's no profit. I prithee, to our rock."
—*Ibid*, act 4, scene 2.

ON a bright November afternoon, in the year of our Lord, one thousand eight hundred and seventy-five, I was finishing a two-days' journey on horseback which I had to make so as to reach the cabin of my friend Franz, the companion of former hunts, with whom I had made arrangements to go on a long-projected bear hunt. We had talked of that bear hunt as early as the fishing season before, or rather I should say, as early as our last deer hunt of the previous fall. In the summer Franz had hired a man to help him through with his work, so that he should have time to spare for *play* instead of work, and should have enough to let him suit the hunt to my conscience whenever I could get away from home to join him. As I broke from the darkness of the tangled spruces that shaded my warm trail, and came into the light of the clearing about Franz's house, I pressed my dear old mare with my knee, and away we went; but we could not reach the house unnoticed. The dogs set up a bark of welcome, and the next moment Franz was dancing about over the wood pile, calling to his wife, who was inside the cabin, "Hyar comes the Colonel!" "Just in the nick of time, eh, Francis?" I said, as I dismounted, and having shaken hands, I slipped off my saddle, hitched my mare to the fence until I should be ready to rub her down, and we carried gun, provisions, and other traps into the house. "By George, Colonel, I'm glad you're come! We'll just rake things," said Franz, as he drew a stool up in front of the fire and sat down. After I had been welcomed by Franz's wife, and had brought out some candy for the little ones, I pulled up another stool, sat down, and while smoking a quiet pipe, talked over again with Franz the long-expected hunt. "What about dogs, Franz?" "Well! You see Thompson, why he promised to let me have his dogs this fall for a couple of weeks, whenever it came good tracking. He ain't no chance to hunt now, he'll be too busy about McNeal's cattle, so I agreed with him about the dogs." "He promised them to me, too," I said. "Well, you see," replied Franz, "that makes it all the better. He can't go back on both his promises. Oh! we'll git the dogs, there won't be no bother about that." "That's all right, Franz, but what about snow; will we have enough of that?" "H'm! It's hard tellin.' Oh, of course, we'll have snow. It always has snowed. What! no snow in November! Why, it can't help but snow. *It's got to snow.* You see this is how we'll fix it. Let's see, this is Thursday." "Yes, and this snow will be gone by Saturday night," I put in; "and we ought to know something about bear sign before we go out and bring in the dogs. We had better look that up to-morrow." "Well, now I'll tell you what we can do," said Franz, and so we went on and talked over our arrangements, while Mrs. McCoy got ready our tea and set the table. The plan agreed upon at last was that we should spend the next two days in utilizing what little snow was still on the ground in finding out where the bears were; that then we would spend Sunday quietly at home, and on Monday morning go out in the settlements to get Thompson's dogs and some more flour and meal, coming back by Tuesday afternoon. Then, the dogs on hand, provisions in the house, and plenty of snow on the ground, we would be perfectly happy, and could start at a moment's notice for a trip of any reasonable length. The conduct of our hunt was based upon the existence, use, or possession of three things. To make a bear hunt interesting, there should be bears, or at least a bear, within the neighborhood of the hunt; then there should be snow in which to track the game to its lair, whether, as usual, in a laurel thicket, or, as once in a while, a rocky den; this done the dogs are slipped, the bear "jumped," followed, worried, treed, probably, and then killed. Delightfully simple on paper. Knowing, as the slang phrase hath it, how it was myself, even to the successful ending of hunts, I already saw in imagination my several new bear-skin rugs stretched upon the home floor; the old ones sigh as they see the new comers. One of the panther skins is relegated to the children's room, my favorite little bear goes under a table. Suddenly in come the children, "Oh! let's have a roll!" "Now, Nelly, I'm going to take the big one, you take the other one." "No! Scort, I'm the older, I must have the big one. Oh! *isn't* it a big one. Did you kill it, papa? I don't see why they kill such nice great big bears, anyhow; bears don't hurt people, at least, not *much, do* they, papa?" "Now, Nelly, you know you'd kill a bear if one came here, 'cause you always want papa to kill hawks and things when they come after birds; and panthers bite, and they're prettier than bears, because they're like cats, and people kill *them*." "When they can, Scort," I add; but at this point my imaginings are cut short by Franz, who says, "I'll tell you, Colonel, what I was thinking of; you see we'll have lots of hides presently; well, now, you can take what you want of 'em, and then I want you to sell my share, and when you get home. I want you to send me enough stuff to make me a suit like that shooting-jacket your brother Dick had last time he was out here—brown velveteen; and then I want," and he went on with his list of articles, great and small, for wife and children. Clearly we were to have "lots of hides;" and they must not sell low, either. We followed out the plan we had sketched. Friday and Saturday were spent in looking for bear sign, and we tramped many miles; deer tracks we saw, but we were not deer hunting; panther tracks we crossed, but traveling tracks two days' old, and we could not expect the snow to last long enough to make sure of catching them; so we looked for the bear tracks or signs, but in vain.

On Sunday we talked the matter over. "I'll tell you where them bear are," said Franz, evidently referring to those particular beasts whose glossy skins we had in our several imaginations devoted to such a variety of purposes; "them bear is all on the Black Mountain, where you and me pitched into 'em last time. It ain't no use to look for no bear *here*. There's too much mast. Down the river its all spruce, and only little patches of mast, and its in them little patches we'll find them bear, that's what I'm thinking." So on Monday early we went after the dogs, and that trip kept us busy as could be until late Tuesday, when we got back to the cabin, tired enough, but in good spirits. "Now, Franz, we're all right. We have the dogs, plenty of provisions, guns are all right; now, if we only have snow, what may we not have." Franz sat before the fire meditatively scraping a turnip. "Oh! we'll have snow. I ain't bothering about that. Shouldn't wonder if it snowed before morning. If it does, we ought to get four or five anyway, agin Saturday." So we went to bed.

"*Did* it snow?" says Dick, who has listened to me as I read over to him what I have thus far written. Snow! I waited ten days at that place for snow, and never saw a flake. The only season I ever knew without plenty of it at that time in November. I'll tell you what we did do, Dick. We went twice down the river to our old rock camp, a good ten miles, and each time we were gone several days, starting out expecting to have snow forthwith, and only coming back when we found the prospect of a fall over. The first time Franz and I went without company, and did not get there until after dark. While we were scrambling around the moss-covered boulders and fallen timber, that guard our camp from too curious eyes, suddenly a panther sprang from under the cliff and dashed up between the rocks to the top of the ledge, and off up the mountain side. He had been lying right in our bed. There was no snow, as you have found out by this time, so we could do nothing with him, otherwise we would have killed him next day. He did not go out of the neighborhood, for he hallooed at Franz a day or so after away up on the mountain. The second time we went there we had company. Just as we were tying up our packs out on the piazza, before McCoy's cabin, and were otherwise about ready to start, a man named Townsend came up and said good morning. "Why Franz, it looks as if you and the Colonel was thinkin' about bears." "You're right we are," said Franz, "and were goin' to start right now." Then Townsend, whom as a near neighbor of Franz's, living some five or six miles off toward the settlements, began feeling his way toward an invitation to go with us. "Well, now, Bill," said Franz, "I'll just tell you how this thing is. You see, me and the Colonel we got up this hunt; we've been a talkin' about it for the last year, ever since last fall. And the Colonel, he's gone and brought in a lot of provisions and such, and him and me went out and brought in Thompson's dogs. Well, we can kill all the bears we need just as well as if there was a dozen of us. The Colonel he's got his pumping gun (Winchester), and he can do all the shootin' needed, and the two of us is enough to trail up and to manage the dogs and make camp and all that. I don't want to be mean though, seein' as you're come over to take a hunt, you come along and join in the fun. We won't give you no share in the hides. You can have what meat you want, and if we have to go to killin' deer, why, we'll divide even all round." "That's fair enough," he replied. "I don't want no bears, I only want to join in the fun." So off we went. We had various creeks to cross at different times, and the river to ford besides. I waded through as the quickest and simplest way, but Franz was for keeping his feet dry, saying it was too cold to wade, so he started to cross the river on some fallen timber, the result of which was, that his right foot went off the left side of the log, and his left foot off the right, causing a most ingeniously complicated fall backward, gun, man, pack, and dog plunging in a confused heap into the river. I tell you what we made good time after that. Franz drove along like a professional against time. That night we lay at the Rock Camp, and instead of snow, as we had expected, had a tremendous thunder storm, which drove across the Black Mountain from the South Fork. The next day was foggy and wet; we started out to see what we could find out about bears. I went one way, and Townsend, who knew nothing about that part of the country, and McCoy went together in an opposite direction. We got nothing, but had a laugh at Townsend. It seems that he and McCoy separated away off on the mountain, to go around a spruce thicket, he to go above it, while Franz went below, and they were to meet at the brow of the mountain some half a mile beyond. When Franz got beyond the thicket he climbed to the top of the mountain, which is there a beach flat, and stood looking about for Townsend. Suddenly he heard a panther hollow at a little distance. Supposing Townsend was calling to fool him, he did not answer until the call was several times repeated, then he answered, and the calling immediately stopped. Looking to his gun, he went over to a thicket some two hundred yards off, from which he supposed the calls had come; and after calling Townsend several times without eliciting any reply, he got provoked, and calling out, "If you don't choose to answer you can let it alone," marched off to camp to get something to eat. He came in about half an hour after I did, and we then went off down the river to shoot red squirrels to feed the dogs. After I had made my fourth or fifth straight shot—twenty in. barrel—Townsend turned up; he had heard our shots and come in. It then turned out that it was a panther, and not he, calling at Franz. He had got lost on the flat on top of the mountain, and could not tell on which side to go down. He could hear water roaring below him whenever he came out to the brow of the mountain, but had he got down on any side but toward our camp, he might have traveled far enough before he would have found any one.

We were at camp so early that day that we determined to use the time well until dark and get in a good lot of firewood, so as to be prepared if the weather should turn cold suddenly, or if we should make another visit to the "rock camp," tired and hungry, and in no humor for wood-cutting, so at it we went. First we cut a beech back-log, some foot and a half or two feet through, and with the aid of handspikes and a lumberman's knowledge of log-rolling, not a politician's, placed it before our room in the rock.

Let me try to describe our camp, for it is a good one. We are at the river, which here runs northwest, a beautiful stream, some thirty yards wide, brawling along our boulders, and quieting itself now and then in a foam-dappled trout-

pool; on our right as we go down stream is Spruce Creek, a noble trout stream coming in from the eastward; cross it, and we are upon the great Spruce Mountain, on the point of which between creek and river lies our camp. Around this point of mountain, about a quarter of a mile back from the river, runs a ledge of rocks; sometimes broken down so as to be easily surmounted, in other places forty or fifty feet high. Leaving the creek and climbing to the foot of this ledge, we follow it some half a mile down stream until we come to a narrow ravine, cut down the mountain-side by a cold spring brook; scrambling across this we mount the other side, and now we are near home. A splendid wall of rock rises vertically before us some thirty or more feet high, crowned with nodding birches and stiff-necked spruces, nested all of them, the lazy fellows, in a carpet of moss, soft and deep. A great beach, felled by us for wood, lies prone along the cliff foot. We walk the length of its trunk, jump down, turn the angle of the cliff, and we are at camp. Under this cliff, facing the river, is a dry, comfortable room, into which no storms beat; a platform in front is wide enough to admit a large fire and not make things too hot; shelves are handy for laying up things in the dry, and holes to stow them away out of sight. There is room for four men with comfort. Some ten steps away, a little down hill, is the dog-house, another dry cave with water convenient; for the cold spring which bubbles out almost within arm's reach of our bed of boughs, and under cover, too, trickles down through the rocks and forms a basin at the kennel.

But we must finish our wood-cutting. Franz stood axe in hand at the top of our big beech, looking up at the black birches crowning our cliff like ferns stuck in a "Gres de Flandres" mug. Presently he speaks. "What do you think of them birches, Colonel?" "What do I think of them? Admirable trees; I always did like them; graceful lithesome creatures, tough as the mischief, too, like some other graceful things; the lumbermen, you know, used to cut them sometimes and sell the stuff with their cherry." "I believe, by jing, I'll cut that one," says Franz, and off he goes, scrambling among the rocks; after awhile he comes out to the edge of the rock above us and peeps over; with his hand around the very tree that is holding him that moment, to be soon hacked and hewed until it tumbles headlong from its perch. No more useless standing still on top of rocks; no more whispering and rustlings; no more caresses and noddings from the innocent looking spruces, as they stood in the soft breezes under the moonlight; but instead, harsh strokes of the axe, a relentless shove, then a tremendous plunge headlong, a crash, and there he lies beside the beech; more axe strokes, and then fierce heart-burnings, until at last no birch is left at all, but in the mind of man lives the remembrance of how much good it did. "I tell you what, that was a fire," Franz says, "Did you see Townsend crawling around and twisting away? I thought I'd give him a dose, he's always rolling in between me and the fire. I thought the birch 'ld fetch him. Did you see him scoot off down the hill?" "Birch! you did some good, after all."

Our second expedition to the Rock Camp proved as barren as the first, at least so much as the killing of bears was concerned, and the returning home in triumph laden with hides. I have no doubt that the others enjoyed themselves, however, despite the "bare" hunt. I am very sure I did, for to me, half the pleasure, or more, to be found in such an expedition comes from the general conduct and changing incidents of the every-day life in the woods. The freedom from restraint, the self-imposed activity or laziness as the whim of the moment may dictate, the delightful effects of flickering lights and shadows about the camp-fire as seen from a bed of fresh hemlock boughs—the very smell of the woods even, in itself a delight—all these make accessories which help to fill up the completed picture of a true hunt. At last we came to the reluctant conclusion that we would have no snow, no matter how long we waited, so we determined to go home to McCoy's and take a few day's knocking over deer. We started, therefore, early one morning, and thought it well to make the journey more interesting by going a new and roundabout way home, that was, to go up the Spruce Creek three or four miles, then cross the parks, turn south, surmount the big Spruce Creek Mountain and camp some where in the great basin beyond it, from where we could reach McCoy's house the next day. We traveled quietly along without incident until near 11 o'clock in the morning, when we were suddenly startled out of our tranquility in a manner not altogether unexpected, and assuredly not unwelcome. We were going along on a bench, about half-way up the side of the ridge separating the forks of Spruce Creek, through an open beech and maple forest, when all at once "Nig," the shepherd pup, who was nosing about on his own account, gave a yelp some where to our rear and above us, and almost at the instant, as we turned to listen, down dashed in front of us from the next higher bench a tremendous buck, his horns white and polished glistening in the morning sun. I was behind, McCoy and Townsend just in front of me. My Winchester was slung on my back over my pack, encased in a heavy woolen mitten and had wrapped around it a dozen turns of the leather thong, by which I was leading one of the bear dogs. To unwind the trap with the dog jumping and pulling like a stump extractor took some time, and then my hand was so moist with perspiration that I tugged hard at my mitten with my teeth before I could get it off, and by then the deer was out of reach. Meantime, McCoy had blazed away as soon as he could, but as one of the dogs jumped against his legs just as he was about to touch the trigger, he accomplished nothing. Townsend had a fair shot, and the deer running within twenty steps of him, he cut-loose at him, as he called it, and "scalped," that is to say, grazed or scratched him, low down through the body. He thought he had missed him and so did Franz and I, until we happened to notice the splashed blood on the leaves, while we were laughing at each other. When I untied the dog string from my hand, I threw the end of it on the ground, and as I supposed, put my foot on it to hold the dog, my hand being thus free for my gun; but the dog did not wait for my foot to fasten him; he darted off, taking the trap with him, and about the moment we thought about and missed him he set up a tremendous tonguing down the valley. We followed as fast as we could for some half or three-quarters of a mile, still hearing the dog in front, when suddenly it occurred to Franz and me to look in the creek and see whether the deer might not have doubled on the dogs and be now retracing his steps to escape in the water. This was well timed, for as we reached the bank there was the buck, some thirty yards off, and entirely ignorant of our neighborhood. Nig had come trotting along contentedly after us, well assured apparently that we would manage it all right without any further help from him, and certain that he would not be neglected when feeding time came. The sight of the deer which he headed off roused him, and he dashed into the water at the buck, who bristled up and raked at him with his horns. Watching the deer's graceful movements for a few minutes, I waited until he held his head still an instant, and fired at the butt of his ear, knocking him over. No sooner had we dispatched our game than we set to work to prepare a feast for ourselves and the dogs. Our packs were hung up, a fire built, and we soon had the deer's liver and heart broiling on the sticks for our delectation, while the dogs crammed themselves with such pieces as we threw to them until they had eaten all the meat and offal, except what we proposed to carry home. We had an enjoyable meal of broiled liver and toast and then took a quiet smoke, leaning lazily on our elbows and watching the dogs, which, stuffed as full as they could waddle, looked at us with knowing eyes, as much as to say, "Keep doing this sort of thing." We could not spare much time, however, if we meant to carry out our programme, so we soon slung our packs and started off again. Franz took the saddle—cut short—with the hide and legs left on; I took my pack full of fore-quarter meat, and Townsend took some in his pack, carrying also McCoy's gun and leading one bear dog. I had the other to lead, letting Nig, who was a privileged character, run loose.

The ascent of the big Spruce Creek Mountain was a tough climb, over moss-covered rocks and through plenty of fallen timber. We did not reach the far-brow until about an hour and a half before dark, when we stood in a little opening at the edge of the descent and looked out over the great basin below us, in which we would somewhere have to spend the night, and beyond which we would have to go to reach home. We looked out over the sea of forest below us for some time in silence, until at last Franz said, "Look here Colonel, don't you believe we could find old Tom's? If we could do that, he would be just the thing." "Where is old Tom's?" "Well, I don't know where it is, but surely you and me can find it. I ain't never been there, but they tell me he's gone in there to make a hacking for old man Moore, and I judge he's got hands a helping him and provisions plenty, so we could have a good time and stir the old fellow up a bit." "How are we to find him if we don't know where he's gone?" "Why, I'll tell you. You know Camp Run?" "No; where is it?" "Why don't you mind where you and me and old Tom came out and killed a panther two or three years ago; we crossed a low divide at the foot of a steep spruce ridge, just where the panther had killed a deer?" "Yes, I do." "Well! that run beyond the divide is Camp Run, I believe, and it must be in there somewhere that old Tom is now."

The next point was to settle to our satisfaction just where we thought Camp Run lay from our stand-point; a few minutes settled that as near as we could guess, for Franz never disagreed much with me as to direction in the woods, if it was a country I knew anything about. I glanced at the compass in my gun-stock, and we determined to strike a perfectly straight course down the mountain and across country, regardless of any and every obstacle, until we should either get to the desired point or be overtaken by darkness. We started. "Franz, let me carry them saddles," said Townsend. "Pshaw!" Franz replied. "You can't carry them; go ahead." However, Townsend would try it, so Franz put them on his back and took gun and pack instead. The unlucky Townsend found his new load more than he had bargained for, and gave it up sooner than he had expected to, for his foot slipped just as he started down hill, and away he went head-over-heels for several hundred feet, rolling and tumbling, unable to stop until he brought up against a big spruce. Franz took his proper load again and away we went at a round pace. We kept a straight course, up hill and down, until just about dark, when we halted in an open field of beech and maple woods to consult as to what to do. I suggested that we had come straight to the point of the ridge which we had picked out as most likely to be the one overhanging Camp Run, and that as we had not reached any clearing and had seen no signs of any man having been about, we had better camp. We had not talked two minutes as we stood there, when suddenly we heard hack! hack! hack! "There's an axe," said Franz. We ran forward a hundred yards, and looking round the point of the ridge there lay the clearing. Franz looked at Townsend—"Bill, didn't I tell you the Colonel and me could find any place in these woods?"

We had a delightful time that night. Old Tom had just finished his log-cabin so that it could be occupied. We had a grand supper and a smoke, and no end of stories afterward. Townsend's pack was made a thing of naught to give the old man a piece of venison. We felt almost as if we were home but I can tell you we had a hard enough tramp next day. It began to rain early in the morning, and we had to travel from early breakfast time until half-past three in the afternoon to get to McCoy's, through a drenching storm. At last, however, we cast off our packs at the familiar porch, tied up the dogs, took a good wash, lit our pipes, and then gave Mrs. McCoy our several and particular accounts of our bear hunt, and how and why it was that hides were scarce, and that Franz would go without his velveteen coat, and she and the children would miss their promised gifts. As I said before, a bear hunt to be interesting needs three things: bears, snow, and dogs. Having only one of these, the dogs, we were obliged to go without the other two.

I spent several days after this shooting deer, which were tolerably numerous about McCoy's, and then with a fine pair or two of horns as trophies, mounted my old mare "Stoopid," and started on my two days' ride to civilization.

HOUNDING DEER IN MISSISSIPPI.

We live twenty-two miles below Natchez, entirely isolated from the world, seldom seeing a stranger, as they have no business in this country. Our only communication is through a boy on a mule, who carries the mail between Natchez and Woodville tri-weekly, that is, he trys to to make the trip in a week. We never go any where, as after meat and bread is paid for we have nothing to go on. We heard incidentally that there had been some sort of a show in Philadelphia last year, and they say there has been a presidential election, but we don't know who was elected. We are not dependent upon such an office for the proper administration of our home affairs, as we have an organization known as "Bulldozers," that dispense justice, and are all that we require, as results prove.

We have during the winter many idle days, which if it were not for our packs of hounds, we would find difficult to dispose of. Deer are plenty, but owing to the immense country they have to run in, they are difficult to kill.

I have a breed of hounds that I think are superior to any in the world; they are descendants from a pack owned by the Chinchester's of Virginia. A few days ago I left home early in the morning to see a neighbor; two of my hounds persisted in following me; they soon got a deer trail going parallel to the road. In a short time they jumped and went due south, away from home and the river; I could hear them some time, as the wind was from the south. On my return home about 2 o'clock P. M., I found the buck dressed and hung up. The two dogs had caught him within a hundred yards of the house. They had run him about five hours.

About a month ago I was out driving, started a doe and ran her in the river. The dogs—four—on the way back to me bounced a buck, who ran straight away from the river. After a while he turned and made for the river, but he had gone out too far, and they caught and killed him within two hundred yards of me. Time from start about two hours. After the running season was over an old buck located himself in a drive within a quarter of a mile of the house. I ran him out one morning and he went straight to the river, I knew he would come back that night, so I sent a friend to stand for him the next morning. I soon had the old fellow moving; he concluded to circle a while before he went to water, but he made one circle too many, for they caught him in sight of the stander, who was near the river. And though six dogs were tugging at him, he dragged along up to the stander, who drove him off and shot the buck in the head. Time from start about three and a half hours.

One morning in December the hounds took a trail that went away due south (away from the river); they were soon out of hearing. We (W. C. Cage and myself) posted ourselves on stands, through which the deer would pass on the way to the river. After several hours Cage heard the dogs. When within a quarter of a mile of him he saw a buck coming, mouth open and much distressed. It ran up to him and he killed it—a three point. Just then he heard the pack stop, and one dog baying he ran to them, and found they had caught a five point buck. He was so near dead that he had no trouble in cutting his throat. They were hung up for the night, and the next morning brought in. Upon butchering the buck caught, we found that he had dislocated his right knee in running, rendering it useless to him—the leg standing out at an angle from the body. The accident had happened within a short distance of where he was caught, as we hounded up his track where he had crossed an opening with the other buck and then he was all right. After he crippled himself the other buck ran away from him, and would have escaped if Cage had have had less patience, as he remained on the stand about seven hours. My pack is too fast and run too long to drive with. They run the deer entirely out of the country, and after two or three races the deer will not come back. They seldom come back (the dogs) under forty-eight hours if the deer does not go directly to water, and they may catch a great many that I never hear of. For successful driving a dog should be slow and mouthy, but game enough to run all day.

DARRINGTON.

For Forest and Stream.

REMINISCENCES OF THE (COW PASTURE) DORCHESTER MARSHES.

There are many in this city, lovers of sports by flood and field, who will remember pleasurably the good times they have had and the bags of snipe and plover obtained in a day's shooting on the old Cow Pasture, familiar to old Boston gunners. The writer of these lines has had many a good day's shooting there in years gone by, and found many agreeable friends from the brother sportsmen he met there. First among them was Caleb L., a celebrated Nimrod, and beloved by all for his sterling qualities. He would always get a good bag, and seemed to have a very fascinating way with the birds. Then there was Joseph K., an old veteran, who was often seen at nightfall wending his way in the direction of the old barn which stood near the centre of the marsh, where he intended to quarter for the night, and be on hand bright and early in the morning. There were also W. L., B. F., and numbers of others; but as we speak of all these, let us drop a tear to their memory. They have passed away from the mortal to the immortal shore, and we shall see them no more. Of the living representatives of those times let us call up a few of them.

First, there was Seth O., the indefatigable gunner, who always had some interesting story to tell. Often as we sat ensconced in the stand have we seen him on the railroad walking from Boston, with his basket of decoys covered by his rubber poncho on one arm, and his gun on his shoulder, on the way to a favorite position in the centre of the marsh, directly opposite the point stand, where he would shortly be seen blazing away at the approaching birds and anathematizing all greenhorns.

Then there were the brothers, R. R. J. and U. R. J., veteran duck and snipe slayers and moonlight inveiglers of ye gentle quawk. Quawking expeditions were much in vogue during those palmy days, and the solemn stillness of the midnight hour was often made to ring with the roar of the Messrs. J.'s guns.

Then there were H. and B. (we have seen neither of them for years), also, T. H. S., the famous gunner, who has done favors innumerable for his brother sportsmen in the way of fixing guns, making and painting decoys, fashioning fine bird calls, etc., etc., and whose authority is so excellent on all subjects pertaining to the gun.

We now recall to mind G. H. M., whose door is always open to his friends and whose kind welcome and pleasant company we have often experienced. Many a fine day's gunning have we enjoyed with him, and we desire to thank him sincerely for his liberality in placing his guns and boats at our disposal so often. Next in order comes F. W., W. P., and O. T. C., who could be seen on almost any day from the 20th of August to the 10th of September, at sunrise, snugly established in the usual place, the point stand, where the continual crack of their guns betokened the sport they were having. We have met them a number of times returning from the marsh with large strings of game, for they invariably met with good success. Their convenient shooting-box in the immediate vicinity was the resort of all the gunners of the neighborhood. What pleasant times we have had within its walls, and methinks I hear the merry laughter of the sportsmen who used to assemble there, at the various ludicrous stories which were told and the comical adventures met with on the marshes. This paradise for gunners has long since disappeared, and the place whereon it stood is now covered by the green turf, and as we gaze on the vacant place a feeling of sadness comes over us at the memory of those good old times, and of some of the happiest moments of our life.

Many a time have we stepped into the old box after a successful day's sport, with a nice bunch of fat brown-backs, yellow-legs, grass-birds, and plovers, with now and then a sprinkling of brant birds, sickle-bill curlew, and willet, and

also numerous smaller birds, such as ringnecks, sanderlings, peeps, and winter snipe, which we did not think worthy of much notice; and on rare occasions we have shot jack-curlews, stilts, phalaropes, and avocets; and oh! the odor of those delicious pot-pies! I can almost smell them now, and can imagine I see the bones of vast numbers of departed snipe passing in procession before me.

Let us pause a moment and brush the cobwebs from our brain, and endeavor to call up some of our other sporting friends, whose faces we have not seen for a long time. There were H. M., H. G., D. C., B. M., and a host of others. We have also heard tell of W. H. C., an enthusiastic sportsman, whose facility for ferreting out all the holes and pitfalls in the marsh and exploring their inky depths by inserting his pedals into them, much to his consternation, was wonderful and unaccountable. Like the gentleman who, after falling into a ditch, was reminded by his companion in advance that there was a large bog-hole behind him, he could say, "It is no matter, for I have found it;" but the sport with the birds would soon after erase from his mind the memory of his mishap. We can heartily sympathize with him, for we have on several occasions experienced the horrors of a sudden plunge into some muddy ditch in our strenuous exertions to capture some stray plover, and should the eye of our above-mentioned friend chance to read these lines, he will no doubt smile at the recollection of his exploits.

We now recall to mind a certain small boy, C. F. P. by name, who, being very anxious to experience the delights of a day's shooting on the marshes, and seeing in imagination visions of great flocks of birds, had prevailed upon two of our fellow gunners to take him on one of their trips; and he, being loaded with a superabundance of clothes to prevent his catching cold, a long gun, an umbrella, and a pair of ponderous rubber boots, was thereby made the unwilling victim of numerous plunges into bog-holes, from which, amidst much tribulation on his part, he would be extricated by dint of hard pulling on the part of the others. We have also heard of the dexterity he displayed in crawling upon his stomach from the stand in search of the powder flask, which had been dropped at a short distance in a sudden rush made for the place during the approach of a flock of beetle-head plover, and of his safe return with the coveted article to his friend, who was anxiously awaiting him, momentarily expecting to see the birds take flight without his getting a shot at them; and the boom of the gun which shortly followed, told the result of stratagem by the increased weight of the contents of the game-bag We think the said boy performed this exploit in a manner which would have reflected credit upon even an old gunner, as every sportsman knows how wary an old beetle-head is. He also again contributed to the success of the day by shooting several large birds, and although he has now grown to man's estate, we have often heard him speak of his pleasant experiences on that occasion.

We will now make a few passing remarks about the old barn which we have before mentioned. Many a time has it afforded us a place of refuge from an approaching deluge of rain. From within its sheltering walls we have watched the dark clouds rolling over the marshes, and the rain drops pattering on its moss-grown roof, together with the vivid flashes of lightning and the reverberating peals of thunder, forming a scene at once grand and sublime; and the thunder of our guns, which were discharged from the open door at an occasional flock of passing birds which where hurrying by to avoid the tempest, added to the uproar of the elements. Many a fat snipe we laid low here, and during the darkness of night it has often given us rest and repose, and upon its soft beds of new-mown hay we have sunk into the arms of Morpheus to dream "our battles o'er again." We remember being told the experience of G. W. W. P. and J. E. W., who together passed a night there. On one occasion, of the unaccountable rustling of the hay and loud breathings which they heard, highly suggestive of ghosts, especially as after a vigorous search of the premises they could find no one about. J. E. W. being rather a nervous individual on the ghost question, was very anxious to keep his companion awake, zealously poking him in the ribs for the furtherance of that laudable object. Perhaps it was the spirit of some dead sportsman returned to haunt his accustomed place. But the inscrutable finger of time has long since swept away this favorite retreat, and its owner, who has often spoken a cheerful word to us as we toiled homeward under our load of game, decoys, and other trappings, has years ago gone to his long home. Let us remember with pleasure the departed glories of the old marsh, and while we breathe a sigh to the memory of our many dead comrades who took part with us in those bright scenes, we will hope our living fellow sportsmen will ever keep green the recollections of those good old times; and as death is gradually thinning our ranks, may the survivors be knit closer together by the bonds of friendship which were formed on the "Old Cow Pasture."

POWDER HORN.

For Forest and Stream.

A QUAIL HUNT IN VIRGINIA.

IN looking over an old diary of 1872 I find the following entry, in reference to my first visit to Virginia upon a shooting expedition.

"Jan. 8th. Left home Monday A. M., via Pennsylvania Railroad, and met my friend H. at Morris Junction, by previous appointment. We were well equipped with guns, dogs, etc., and anticipated a very pleasant and successful trip, although it was our first attempt, and I am glad to say we were not disappointed, which I can assure you is not always the case. Enjoyed a very quick and pleasant race down to Washington, and here we determined to take a sleeping coach and go on the same evening to Lynchburg. We did so and had a very comfortable night's rest, and arrived in the city Tuesday morning at four o'clock. Stopped at the 'Worrell House,' and received good attention and meals, etc. Glad to find one of its proprietors a sportsman, from whom we got much valuable information, and concluded to make that point our base of operations from whence to do our shooting. Here we soon became acquainted with other sportsmen, and it was their opinion we could not find much good 'partridge' shooting within a distance of ten miles of the city. Obtaining an early lunch we got a carriage and drove out into the country to try our luck. It had been raining very hard during the night, and the red, sticky clay soil was not the most inviting, as we found to our sorrow. The face of the country is very undulating, rough, and broken, and of course the walking difficult, even when the ground is dry and firm. The 'Blue Mountains' are in full view some fifteen or twenty miles distant, and the 'Peaks of Otter' loom up in bold and undeniable grandeur, affording the most conspicuous and unmistakable landmark to the traveler in a new and strange land. All through this portion of the State there is much land, 'turned out' as they call it, and suffered to grow up in broom-corn sedge, briars, sassafras, scrub-oak, and pines. This, I suppose is so from the fact of its being so sterile as not to pay cultivation; and because they have so much of it that they are 'land poor.' Upon a large and neglected plantation of this description you often find plenty of 'partridges' and excellent cover, and good feed to protect and sustain the game. It was quite late in the P. M. when we arrived upon our shooting ground, owing to the heavy roads and the slow advance we made. It was not long before we found game in good open wood shooting, feeding we thought upon small acorns, etc. Mr. Irvine, whose acquaintance we had made in the city, a most gentlemanly and thorough sportsman, had kindly consented to accompany us, and being well armed with a breech-loader as well as Mr. D., it was not long before the hills and roads began to resound with the reports of our guns, and we were having first-rate sport, if we did not do so much execution in filling the bag. Upon our return we counted out some fifteen nice fat birds, which was doing pretty well considering all things. In simple justice to my friend D., I must say this was about the first real experience he had ever had wing-shooting, and had only undertaken the trip upon the recommendation of his physician to regain his wonted health and strength. Having been thrown from his carriage and injured very much sometime previous, he was advised to take exercise walking, and in order to combine amusement with it, to get a dog and gun, and this was about his first effort, and as he assured me resulted very beneficially to him. Earthworks were still visible in many places surrounding the city, and I think it was not captured during the war. I could not suppress the reflection that the peaceful and pleasant way in which we were burning powder was much more sensible, and certainly less dangerous, than the hostile attitude of the combatants of the recent civil strife.

Wednesday, concluded to try another locality, and enjoy as good shooting with less hard and tiresome walking. Appomattox County was recommended, and we left on the morning train, and arrived at the station at eleven o'clock A. M. This is a very small place and no hotel accommodations at all; and the best we could do was to get quarters with a private family for a few days. Another gentleman and sportsman kindly acted as guide to this place; had it not been for him we could not have got any place to stay at all. I regret I have lost his name and address, and will always feel grateful to him for some fine shooting. The walking was much better here and game quite as plenty, and we made a remarkably fine bag for the time we were in the field—thirty 'partridges' and five hares.

Thursday was a fine hunting day and we expected to give our 'contraband' a heavy load, besides our 'quacks' which he carried along. We got a good start and were lucky in finding some full coveys of birds, and some excellent marksmanship was displayed, and, as I had foretold, our bag was well filled—I think nearly forty head.

Friday our good friend returned to L. with a fine lot of game. We had some left and gave away to others. To-day we got thirty more, and twelve in a half day, Saturday. Sent home a box containing sixty or seventy, and at 12 M. Saturday took the train for Richmond to spend the Sabbath. Found excellent accommodations at the 'Exchange.' Visiting the principal objects of interest in the city in the morning, and in the afternoon rode out of town to see the crumbling earthworks, and on Monday we went directly by rail to 'Acquia Creek' to enjoy some duck shooting, as we were told immense numbers had collected there and in its adjacent waters. We soon discovered the importance of being better posted to avoid disappointment in looking up a locating, reliable shooting ground. It was true wild fowl were here in abundance, but the place did not have a guide, boat, decoys, and not even a hotel, and we were only too glad to get upon the staunch old steamboat Keyport in time to continue our journey to Washington that evening. We were served with a most excellent meal, and I felt very much at home upon the steamer, as I had taken many trips upon her in more northern waters and near my own home before. As far as the quail shooting we had enjoyed during the trip was concerned, it was a success, but our original intention was to have a chance at the wild fowl also. At Baltimore we thought we would try our luck again. My friend was acquainted with members of the various sporting clubs of the city, and thought certainly through the kindness and courtesy of some of them to enjoy some fine sport down below the city upon the river or bay. In this we were doomed to disappointment. The most violent snow storm set in and continued with unabated fury for several days, and it being impossible for us to stay from home longer, we reluctantly turned our faces homeward, and arrived in good health, safe, and sound. My friend D. wrote me soon after; he was so much pleased with his experiment that he desired me to go West with him. Every year since I have been shooting from one to two weeks either in Virginia or Maryland, and have uniformly had a good time, with fine success in the field, but *no duck* shooting. M.

Game Bag and Gun.

GAME IN SEASON IN APRIL.

Wild Ducks, Brant, Geese, Etc.

SNIPE.—Some few birds have been killed on the Hackensack and adjacent meadows, but the main flight has not, up to this writing come along. Our friend, Justus Von Lengerke who generally gets about the first bunch, very generously divided his bag with us on Sunday. On the meadows in Morris County there is still too much water to enable farmers to do well.

VERMONT, *Ferrisburg, Vt., April 7th.*—Ducks very scarce here this spring—and no snipe. Of the last there are never but few seen in the spring migration. The Lake, (Champlain) has been broken up for some days, but the weather is unpleasant. Northerly winds prevailing.

R. E. R.

MASSACHUSETTS, *Salem, Mass., April 9th.*—The past week has shown the first snipe of the season, taken on the 4th by Mr. G. B. Stone. Weather and birds, including woodcock and ordinary spring migrants backward. Geese flew thick on Wednesday and Thursday, April 4th and 5th. "TEAL."

WISCONSIN, WESTFIELD, April 7th.

Spring shooting has fairly opened in this section. Wild fowl have arrived in considerable numbers, and snipe are just putting in an appearance. The welcome booming of the pinnated grouse is heard upon the meadows and low lands, and the inspiring carols of the song birds assure us that spring is here. But very few wild geese have as yet been seen. It is probable that this week the woods will be filled with "amateur" hunters after pigeons; the advent of these migratory birds being the signal for "every man, boy, and fool who can sport a fowling piece" to go forth and slay to their heart's content. When viewed in the line of *sport* pigeon shooting does not rank high, but coming as it does after a long cessation of all shooting, the practice is quite pleasurable. The woodcock is indeed a *rara avis* in this section, never being pursued solely for sport, but occasionally shot by sportsmen out after grouse, etc. FRED.

WISCONSIN, *Janesville, April 9th.*—Ducks, geese, cranes, etc., here in abundance; a few pigeons have been seen. Robins, black birds, and blue birds have been here for several days. Koshkonong Lake is still full of ice, but think it will be clear in a day or two.

—We have never known English snipe to be so scarce at this season as they now are. The few that are for sale by our city game dealers are sold at one dollar per pair. They come from the lower part of the State of Delaware. At this price they are decidedly the dearest delicacy in the market. Every year the bird seems to be growing less numerous. We have heard of several parties who hunted for them without success this spring in localities where they were formerly abundant. —*Germantown Telegraph.*

PENNSYLVANIA—*Philadelphia, April 3d.*—A pigeon match was shot at the Wheat Sheaf Hotel, on Easter Monday, between MESSRS. Fry, Boudwin, and Irwin, for Sweepstakes, $10 entrance, 12 birds each, 1¼ ounce shot. The following is the score:

E. Fry	1	1	1	1	0	1	1	1	0	1	1—10
G. Boudwin	1	0	1	1	1	1	0	1	0	1	1— 9
A. Irwin	1	1	1	0	1	0	0	1	1	1	1— 9

The Mr. Boudwin that shot in this match is our celebrated taxidermist, and he is as able and ready with the gun as he is skillful and artistic in preserving its victims.

POSTAGE.

A DOUBLE SHOT.

BOSTON, April 6th.

EDITOR FOREST AND STREAM.

If you think the following item is worthy of publication, please let it be recorded, that Dr. H. M. Knowles, iron manufacturer, of Cleveland, Ohio, while on a gunning expedition at the "Hone's Point" club grounds in Ohio, had his attention called to a woodchuck by one of the natives, who asked the Dr. to shoot it (the woodchuck I mean), which the Dr. in his usual graceful and accommodating manner did; and immediately as the report of his gun rang out on the air, the native exclaimed "There goes a fox!" when the Dr. quickly wheeled around and gave "Jack Reynard, Esq." the contents of the other barrel of his gun, rolling the aforesaid Esq. Reynard over in fine style, thus making a double shot of a woodchuck with one barrel and a fox with the other, much to the astonishment of the native, and to the pleasure of the Dr. Very truly yours, SLUG BROOK.

TAXING GUNS.

ALBANY, April 4th, 1877.

MR. EDITOR.—Your correspondent Venator in his article on Pot Hunting says *all* sportsmen would willingly pay a tax of $15 per annum on their guns to know that it would debar so many from owning guns. This is the only construction you can put upon his letter. How else could there be such a suppression of shooting throughout the country? Does he mean all *true* sportsmen or only that class who call themselves such, but in reality are a lot of selfish tyrants with no thought but self, with means to go when and where they choose, whose one wish is to enjoy themselves no matter if poor people do or not, who think the birds of the air and fishes of the sea (to quote Scripture) were created to be monopolized by the more fortunate, while the poorer class are considered as mere machinery to cater to their tastes and wants, without enjoying any of the privileges intended for all—the rich and poor alike. There are many men who exert themselves, and squeeze their purses to have a few days shooting; this they can hardly afford, without being compelled to pay a tax for the sake of owning a gun. Now, Mr. Venator, suppose the farmers should be as tyrannical as you wish to be, and not allow any one to shoot on their grounds, then what benefit would your guns be to you? Only to look at and sigh over, like the man who bought the elephant to prevent his neighbor from having it, but could make no use of it after all. If Venator and a few more such liberal-minded sportsmen would donate their $15 and some of their energies to the prosecution of law breakers, it would be more creditable to themselves and beneficial to all. Although no friend of Pot Hunters, still I do not like to see any one wish to deprive the poor man of his privileges.

Wishing V. and all others the best of success in their earnest and sincere desire to promote the interest of their fellow men, I am yours very truly, DEXTER.

[We do not believe in a gun tax for this country, but we heartily approve of one on dogs. As for the term "Pot Hunter," our definition of it is, "one who shoots game for profit and not for pleasure, and who is not particular as to the mode or means used; who would rather shoot into a bevy on the ground than at a single bird on the wing, and who corresponds with a game dealer."—ED.]

JOSEPH BRADDELL & SON'S GUNS.

LONDON, ONT., March 26, 1877.

EDITOR FOREST AND STREAM.

In your issue of the 22d, "Inquirer," San Francisco, asks about Jos. Braddell & Son's (Belfast, Ireland) guns. I have known the present representative of the firm since my school days, and have used his guns for over ten years. Several of my friends, who were so much pleased with the workmanship and shooting of the gun he made for me, have ordered guns from him, and in every instance have given the utmost satisfaction. The gun I at present own—made for me six years since, breech-loading, C. F., 12-gauge, 30-inch barrel, 7½ lbs., with a charge of 3½ drs. of powder, 1 oz. of No. 8 shot—will fetch quail every time between 50 and 60 yards, if held straight, which I consider a very good test of how a gun, without choke-boring, throws its shot. I have no hesitation in recommending Joseph Braddell & Son's guns as being first-class in every respect, and all they warrant them to be.

—Baldwin, the clothier of Broadway and Canal Street, retails C. O. D. over Four Hundred Thousand Dollars worth of Boy's clothing annually, and competition thus far has failed to decrease the amount a single dollar. Parents know where to make selections for the boys.—*Exchange.*

Fish Culture.

THE HISTORY, DEVELOPMENT AND UTILITY OF AQUARIA.

ICHTHYOLOGY is a hard word to master, but it is nevertheless so fast assuming prominence, that it promises soon to become a household word. Very little was known until quite recently of the habits of the denizens of the deep. The movements of a few edible fishes which inhabit shallow water had been studied a little, but of the great mass of the finny tribes we knew absolutely nothing; not so much because of a lack of interest in such knowledge, as for the reason that we had no means of acquiring the desired information. In fact, the inhabitants of our rivers, oceans, and lakes were nearly as much concealed from observation as they would be were they inhabitants of another world. But the activity and persistence of thought and research at the present day have most effectually overcome the principal obstacles to studies of this kind, and finally, conditions and curious facts connected with life in the water. The dredging of ocean beds and even the deepest sea soundings have revealed the most astonishing fact, that life exists even at very great depth, and under condilions of pressure which seem almost incredible. But little difficulty has been found to learn what of life the sea contains; but to become acquainted with the habit-, mode of life, etc., of the denizens of deep water was almost impossible, until the aquarium was introduced, whereby we could preserve the lives of fishes under conditions which would permit of our constant examination of them while free to move and act at will.

It has long been known that animals living in water may be kept in transparent glass vessels by frequently changing the water; but it is only by the modern discoveries of chemistry and physiology that means have been pointed out, whereby aquatic life may be long maintained without the frequent and inconvenient renewals of the water. Science has now taught us that plants growing in water restore to that element the oxygen so necessary to the life of the fish, and remove therefrom, by absorption, the carbonic acid thrown off by them, as by land animals, in the process of respiration. Again, it has been found necessary to add certain varieties of water animals, which feed on decomposing animals and vegetables, to act as scavengers for the more particular members of the fish community, to whom any considerable amount of decaying matter is found injurious or fatal. The discovery of these facts and conditions has made the employment of aquaria on a large scale a practical possibility, and introduced to the world a new and interesting means of material progress in the study of natural history.

The first experiment of this kind on a large scale was undertaken at the Zoological Gardens, Regent's Park, London, in 1853, only twenty-four years ago. Quite a number of tanks were fitted up, the largest of which were 6 feet in length by 30 inches in depth. They were fitted very much as those now shown at Woodward's Gardens have been, and were supplied with sand, gravel, appropriate vegetation, molluscs for scavengers, etc. The water was simply allowed to run off and be pumped back again, falling into the tanks, as seen at Woodward's, in such a manner as to carry considerable quantities of air entangled with it. Thus a quantity of water can be used indefinitely, care being taken to secure the presence in the tanks of such fish as will act as scavengers in removing any decaying substances which may be present. It should be borne in mind that air is as necessary to sustain life in aquatic animals as it is for those which live upon the land, the gills of the former serving the same purpose as the lungs of the latter, the blood being decarbonized or purified by the particles of air, which are mixed with the water, coming in contact with the gills, just as the blood of land animals is purified by coming in contact with the air in the lungs.

The success which attended the aquarium at Regent's Park induced the construction of aquaria in several of the largest cities in Europe, and finally in our own country. The largest and most complete work of this kind has been constructed at Brighton, one of the most famous and charming watering-places in England. It was opened to the public about five years ago, after nearly two years of time and a vast outlay of money had been expended in its construction. This aquaruim is divided into a series of corridors, the largest of which is 220 feet long, most beautifully and appropriately ornamented. The aquarium contains a great number of tanks, some of unusual size, and the largest of which is 120 feet long. Several works of the kind have been constructed in the United States, but that one lately rebuilt by Mr. Woodward, at his Gardens in this city, is the second largest and most complete after the New York Aquarium, and that gentleman is deserving of the highest credit for the enterprise and zeal which he has displayed in furnishing the public of California with such an extensive and useful medium for the study of one of the most interesting branches of natural history. A most complete opportunity is here provided for watching the movements and habits of living creatures, possessing most interesting and remarkable characteristics, but whose haunts have heretofore been confined to the most obscure and unapproachable recesses of ponds, rivers, and oceans. By the facilities which Mr. Woodward has here provided, the student is able to actually walk amid the very habitations of the most curious and recluse of the finny tribe; where their every movement is as open and free to observation as is that of the tiny goldfish, which disports itself in a crystal globe upon a parlor table. Such an exhibition cannot fail to prove a source of unlimited interest to the sight-seer, and an object of the most intense gratification to the scientific investigator. A volume of natural history is opened here, illustrated and illuminated in a manner which cannot fail to excite the interest and attention of the most indifferent; and certainly no one who will look upon it can go away uninstructed or unimpressed with the volume and its pages. A writer upon natural history says:

"Studies of animated nature have been pursued with increased ardor and success since the establishment of aquaria. Vast regions of animal and vegetable life, the mere existence of which was known to but a few of our leading naturalists ten years ago, are now explored by thousands of observers, and the wonders of the brook, the river, and the mysterious sea have familiar things among persons of intelligence and scientific inquiry, who, without the help of the aquarium, must, for lack of leisure and means, have remained content with brief technical descriptions, conveyed in pondrous books, to the perusal of which there would have been no sympathies to attract them. It has created a taste for deep-sea studies, and then fed that taste with wholesome truths; and by giving delight to the eye, and stimulating, through the medium of recreation, the spirit of scientific inquiry, it has brought subjects of profoundest interest within the practical reach of the humblest student of the ways of God and nature."

Who can tell the interest or enthusiasm in scientific study and research which may be engendered in the minds of the thousands of children and youth who weekly visit the vast and instructive collections in all the various branches of natural history, botany, mineralogy, etc., which have been collected and thrown open to the public in this vast conservatory of art and science? If Mr. Woodward had never done anything else, this work alone would form a monument of industry, genius, and usefulness which any man might well be proud to leave as a legacy of life-work to future generations.

San Francisco, Feb. 28, 1877. OSCAR SPITZER

GROWTH OF SALMON AND TROUT.

Our illustrations herewith show the development of salmon from its ova to the adult. They will apply equally to trout.

No. 1 shows the young ova developing the head (magnified);

No. 2 shows ditto developed (magnified);

No. 3, the head and body of the fish developed (magnified);

No. 4, young ova before the developing in natural size;

No 5 shows the ova of the natural size, after the vital principle has been developed. The body of the fish in this stage has a pinkish tinge and the eyes are very large.

No. 6, the shell of the ovum just burst, and the head of the fish protruding from it.

No. 7, the state of the ovum shown after the bursting of the shell, when the pulsations of the heart become visible.

No. 8, the shell just thrown off, the tail drooping; about a third part of the shell, which is transparent, is fractured by the fish in its exertions to extricate itself. Before the shell is broken the tail envelopes the yolk, which is seen attached to the body of the fish.

No. 9. The tail in a short time becomes straight, and the fish more lively; the mouth assumes a distinct form, and the lower and pectoral fins, which are quite transparent, are in motion simultaneously with the actions of the heart, which beats from sixty to sixty-five times in a minute.

No. 10 is a magnified representation of No. 7, the fish adhering to the shell, which is partly broken.

No. 11 represents No. 9 magnified; the heart is before the pectoral fins, under the throat.

No. 12 is a still more enlarged view of No. 9, showing the direction in which the blood circulates, as seen by a microscope.

No. 13. Salmon (developed shape).

No. 14. Salmon, male (in summer).

No. 15. Salmon (in fall).

The blood flows from under the body of the fish through the blood vessels, ramified along the sides of the back, and is then collected into the large vessel which runs along the front and bottom of the bag, communicating directly with the heart. An equal quantity of air, or some transparent matter, circulates with the blood. The blood is drawn by the heart from the large vessel alluded to, and thrown in regular pulsations into the vessels of the head and throat, where it assumes a dark color. The rays of the gills are visible, and the fish soon begins to assume a brownish color.

Salmon fry, or smolts, for some time wander about the sides of the stream, where the current is obstructed, but as they acquire strength, they trust themselves to the midstream, play in the pools and deep spots, and on the setting in of the spring rains in the following year, are carried down to the junction of the river with the salt water, where they remain till habituated to the novel element, into which they then proceed. The growth of the smolts, or young fish, is very rapid, especially after they have reached the sea, where food is in abundance. Fry marked in April or May have returned by the end of June, weighing from two to three pounds and upward, and a month or two later they have been found to weigh as much as six pounds. The small sized fish under the weight of two pounds are called "salmon-peel," all above that weight "grilse." The growth of the grilse during the second visit to the sea and for several subsequent years equals, if it does not exceed, that of the first year. The land-lance and other fishes constitute the food of the salmon when out of sea; and that it is a voracious feeder may be inferred, both from its rapid increase of size and its dental arrangement.—*Canadian Illustrated News.*

ABSTRACT OF THE SEVENTH ANNUAL REPORT OF THE COMMISSIONERS OF FISHERIES OF THE STATE OF NEW JERSEY.

THE Commissioners open their Report with a reference to the question of legislation, and finding that laws relating to the same interests are at variance in different localities, they suggest that laws of a more general character be enacted, to give the necessary protection to and fostering care over the fishing interests on the seaboard, as well as on the inland waters. Attention is also called to the unsatisfactory character of the laws regulating fishing in the Delaware, which river, once abounding in the choicest varieties of permanent as well as anadromous fishes, has been greatly depleted of them in late years. Riparian to the States of Pennsylvania, Delaware, and New Jersey, each of these is interested to a greater or less extent in the fishing of this great river and bay. As between the States of New Jersey and Pennsylvania the laws have always been concurrent, but Delaware claiming jurisdiction over the entire surface of the river within the "Twelve Mile Circle," the result has been to permit illegal fishing to be carried on without let or hindrance, to an extent which has seriously affected the interests of all three States, and it is hoped that the question will be speedily settled. The concurrent laws of New Jersey and Pennsylvania have been so frequently supplemented by acts supplied to meet arising contingencies, that they have become exceedingly complicated and obscure. To remedy this evil, the Commissioners of both States have prepared a draft of a law, which is printed in the appendix to be submitted to their respective legislatures, which it is thought will meet all difficulties.

In reference to shore fisheries generally, the Commissioners are of the opinion that pounds, weirs, and other stationary apparatus for the capture of fish should be prohibited, except in certain cases, where they should be licensed. The reports of the Fish Wardens show that shad fishing in the Delaware was less remunerative the past season than the previous one, the reasons given being the severity of the season, and the fact of an unusually large number of drift nets being in use on the bay, caused by an expected unusually large demand at Philadelphia during the Centennial Exhibition. The aggregate catch, however, is admitted to have been far less than usual. For convenience, the State is divided into two departments, viz.: the Southern or Tidal Department, and the Northern or Non-Tidal Department. The counties in the different departments are each in charge of a Fish Warden, whose individual reports form the bulk of the general reports. Our space will permit us to give but a brief abstract of each.

The Warden of Cumberland County reports 34 drift nets in use, against 15 for 1875, the lengths being also much longer, averaging over 500 fathoms each. The average catch was about 1,000 (shad) per net, against 2,500 the previous year. The price was about $25 per hundred. During the season three schooners were engaged in sturgeon fishing at the headwaters at Bay Side. They took between 1,500 and 2,000 sturgeons, but we could not ascertain where they came from. The Warden has neither seen nor heard of the black bass placed in the waters of the county the previous fall, although he has made diligent inquiry concerning them.

The Warden for Salem County reports the catch of three shore-nets in his district at 5,000 shad and 200,000 herrings—not enough to pay expenses. There went out from Salem County about 125 shad drift-nets owned and fished by residents, and about 100 of the same kind owned and fished by non-residents, making a total of 225, against 175 of the previous season. The Warden ascribes this increase of drift-nets to the obnoxious "license" law of the State of Delaware, which discriminates between her citizens and non-residents, by imposing a tax of $5 on the former and $20 on the latter, thus driving her citizens, and also non-residents, to the other side of the river to avoid the payment of the said tax. These drift-nets range from 325 to 600 fathoms in length, and are sunk twenty feet below the float line. The catch by drift-nets was about 246,233, against 316,000 the year previous. The price averaged about $18 per hundred. The difficulty alluded to before, with regard to the "Twelve Mile Circle," was fully exemplified, as the Warden has counted twenty nets fishing within the circle of a Sunday, and was powerless to prevent them. On the 15th of November, 1875, the Warden assisted in planting fifty black bass in Salem Creek, below the dam at Sharptown, and forty-nine in Alloway Creek, below the dam at Alloway town, since which time he has neither seen nor heard from them.

The Warden of Burlington County sends a voluminous report, which is so distributed in detail that we cannot summarize the catches from the various fishing stations. The tenor is the same as those given above, with the exception that the fish are reported to be larger. From the Warden's reports, it would seem that while the fishing for fifty miles below Philadelphia was unusually remunerative, that above, as far as Trenton, was quite the reverse. The catch of shad at the shore fisheries afford a fair index of the deterioration gradually going on in the river generally. Before the introduction of the drift-nets in the rivers of the Atlantic slope, there seemed to be no diminution of shad caught at the shore fisheries. With the increase in numbers and in the length of these drift-nets the catch has decreased, and to

such an extent that more than one-half of the original shore fisheries have been abandoned, while the remaining half have become almost valueless. This falling off has been the more apparent since the adoption of float-lines, by means of which, with a comparatively small depth of web, the net is suffered to fish near the bottom of the river, where most of the shad are found, and thus more effectually preventing the shad from passing to their spawning beds in the upper Delaware. Thus another cogent reason is presented for the strict observance of the close times.

There are numerous reports from the wardens of various counties in the Non-Tidal Department. From Sussex we learn that progress has been made in procuring the assistance of the Pike County (Penn.) officials. It is to be hoped that between them they will be able to stop some of the illegal fishing in the Delaware. In Warren County the Warden removed all weirs found in the Delaware, and those in many of its tributaries, notwithstanding threatened violence. He reports that large numbers of young salmon were seen late in the summer in the Pequest, and that one weighing 3½ pounds had been taken. The Warden of Hunterdon, in speaking of the shad fisheries, says: "It is with regret that I look forward to the destruction of this delicious fish in this, the best river in the country for them: but unless additional protection is given to their propagation they will soon be destroyed. One agent of destruction I have called attention to in previous reports. I allude to the Delaware and Raritan Feeder and the Trenton Water Power. Owing to the low water in the river in the fall of the year, nearly all the young shad coming down the river are turned into the feeder and destroyed by going through the turbine wheels at the different mills on the banks of the feeder" Another cause of destruction to the young shad is the recent introduction of black bass into the river. The increase of the black bass has indeed been wonderful. Although but few were put into the river at Phillipsburg, some five years ago, now they are caught by thousands, and by many appear to be appreciated more as an article of food than any other fish. But as the principal food of the bass is young fish, I regard them as a destructive foe to the young shad, and I believe that unless something be done for the more successful propagation of shad, the bass will in a few years utterly destroy them.

From Mercer County come many complaints of violations of the law, and the same report with regard to the scarcity of shad. Black bass are very numerous and some of large size taken with the rod.

The Warden of Passaic County says, that the fishing in his county, particularly for perch and *pickerel*, has been excellent during the past season, and he has taken a great number. In Greenwood Lake, he says black bass have been taken in extraordinary numbers, and he is of the opinion that these fish should be introduced into all the waters of the State. Trout fishing has been poor, owing to the scarcity of water (we should have attributed it to the scarcity of trout); in fact (he says), most of the trout streams have disappeared altogether from sight, and he recommends the restocking of those streams which still remain in existence. The Warden appointed, especially for Greenwood Lake appears to have done good service in destroying nets, etc. About 12,000 perch and pickerel were placed in Passaic River and Pompton Lake, according to orders.

The Commissioners report that, in the upper part of the State the Wardens have done good service and the new law has worked well. Posters, giving the text of the recent enactments and the names and addresses of the Wardens, have been printed and distributed.

It appears from the Reports, that in all sections the people demand fishes for the purpose of stocking the streams. Now that the work of protecting the streams is fairly inaugurated, it is proper to satisfy this demand as far as possible. Commissioners have placed during the past year more than 7,000 bass in the waters of the State, having distributed them among all the counties. All sent out were large enough to take care of themselves, and will spawn next year.

The salmon which were in the hatching-house at the date of the last Report were all placed in the tributaries of the Delaware and the Raritan, in Warren and Hunterdon Counties. It is possible that the almost unprecedented drouth of last summer, which caused lower water in the Delaware River than has been known for half a century, and also a corresponding increase in the temperature, may have injuriously affected this class of fishes. It is known, however that those which remained in the tributaries (as the Pequest) near the headquarters of the Delaware were not injured. Further down the river, near Lambertville, quantities of the hardiest varieties of fishes perished from disease produced by the high temperature of the water. The Warden of Hunterdon, who is an old fisherman, reports that he has never before seen so many fishes destroyed by this cause.

The culture of carp is dwelt upon in the Report and its introduction advocated. The Commissioners made no effort the past year for the artificial propagation of shad on account of the difficulty of getting spawners.

"The necessity for adequate legislation to prevent the wholesale destruction of young fishes on their way to the sea by the Water Power and the Feeder has, in consequence of the unusually low water in the river during the last season, been made more apparent than ever. A proper guard or screen at these places through the months of August and September would remedy the mischief. The evil is fully set forth in the reports of the Hunterdon and Mercer County Wardens. We have directed attention to it in several of our previous Reports, and we again allude to the matter, believing that no artificial propagation, however successful, could completely repair the waste from this cause."

NEW YORK.—We learn from the *Greenville Advance* that Seth Weeks, proprietor of the Corry Fish Hatchery, has notified the Fish Warden at that place (Mr. N. C. Packard) that he has been directed by the State Fish Commissioners to furnish him with 3,000 salmon trout fry, being the first installment for stocking the Shenangos at their head waters. The Warden will receive and deposit the fish as soon as the water assumes a natural temperature. This class of fish flourished in those waters years ago, and were frequently taken at weights from ten to twenty pounds. Future installments will embrace other branches of the salmon family.

CONNECTICUT—*Rockville, April 3d.*—This forenoon Mr. Brady arrived here with 5,000 land-locked salmon, one-third of which we placed in a pond I prepared on purpose, and the balance (excepting about 50) were carefully placed in the brooks emptying in the Snipsic Lake, of 625 acres extent. This work has been carefully performed and I hope for good results. Truly yours,

JOS. M. WADE.

FISH HATCHING IN MICHIGAN.—A desirable opportunity is now afforded to any one wishing to buy the well-known Fish Hatching establishment of the Messrs. Clark, at Northfield, Michigan. Capacity of springs about 1,500 gallons per minute: hatching house 30x80 feet. Large trout and grayling in ponds. Dwelling house, etc.

Natural History.

For Forest and Stream.

THE DOMESTIC LIFE OF THE BROWN THRASHER.

BY ERNEST INGERSOLL.

THE brown thrush—also called red thrush, sandy mocking-bird, red mavis, and ferruginous thrush, and whose name in the books is *Harporhynchus rufus*—inhabits the Eastern United States, extending north to the Red River; west through Nebraska, Dacotah, and Colorado; and south to the Rio Grande, beyond which the type is replaced by other races. It winters in the Southern United States and breeds throughout its range.

The nest of this bird has a peculiar charm for me, for it was the first one that I distinctly remember to have found, and it was priceless to me. That first nest was sunk in the grass of swampy woods, but this situation I soon found out to be the only one affected by the thrasher. He is an inhabitant of out-of-the way orchards and the edges of the woods, where his "querulous smack" or versatile song is heard among the first-comers in the spring. In such a locality he builds his nest. It may be on the ground or sunk into it, on a brush pile, on the end of a fence-rail, in the dense centre of a hawthorn or a hedge never fail to look into every thorn bush), or twenty feet up in the fork of a sapling.

Early in March, in Florida and Louisiana, the birds having paired, they begin to look about for some such a place for a homestead. In Pennsylvania this does not happen until early in May, and by the time the thrashers have reached New England, in the middle of the month, they seem to have already paired off and immediately begin nesting. "After the selection of a suitable site both birds set diligently to work until a nest is completed, which is the result of four or five days' steady labor." If placed above the ground, the nest is composed outwardly of a layer of twigs; sometimes with many dry leaves underneath, then leaves and strips of cedar and grape-vine bark, or broad grasses and fibrous roots, firmly woven into a broad and flattish structure. It is not so loose as the cat-bird's, so bulky as the blue jay's, or so ragged and disreputable-looking as the king-bird's, nor has it hardly any mud in its composition. If on the ground, or sunk into it—like that first proud discovery of mine, or a very handsome one I found under a tiny evergreen bush on a side-hill in Connecticut last year—the nest will be found constructed almost entirely of interwoven broad grasses securely bound together, and with the edges overcast in the best style of basket-finishing. Mr. Gentry considers that its firmness is due to the previous condition of the materials, which, having been moistened with water and plastered with mud, become so agglutinated as to require great effort to detach them from the fabric. Its thickness is also great. This strength and trimness give it an indefinable character not easily mistaken by the experienced eye.

Occupation closely follows the completion of the nest and lasts through a week, three to five eggs being laid. Their color is greenish, or dirty white, over which is thickly sprinkled a pepper-and-salt of reddish-brown. These minute dots tend to aggregate at the great end, around which they sometimes form a perfect wreath. Their length varies from .98 to 1.12 inches, with a mean of 1.05; their breadth ranges from .77 to .87 of an inch, with a mean of .82.

In the duties of incubation it is probable that the males frequently share, although some observers say that the female alone sits on the eggs. Thirteen or fourteen days are required to hatch them, the time depending somewhat upon the weather. Both parents watch over each other and their charge with great care and anxiety, wreaking instant vengeance upon all intruders. Like the cat-bird, the thrasher is often called upon to resist a dreaded enemy—the black-snake—which coils himself around the beautiful structure and devours the callow young in spite of the frenzied parents, who fight so recklessly as often to fall a prey to their own temerity. I myself have seen it once. The terrible beauty, the black, shining folds, the easy-gliding movement, the erect head, jewel-eyes, tongue "playing like subtile flame," bring to mind the great myth of the Tempter and his intrusion into that first home long ago, and make us wonder whether, after all, the woman was really to blame for yielding under the terrible fascination of such a presence.

When the nest is taken the thrashers utter a gutteral, whining complaint, and follow the person who carries it away. The mother's call to her little ones consists of tender, solicitous whistlings, followed by a few smacking chicks, not very loud. The male rarely sings to his mate close to the nest, fearing to attract attention. They are intolerant of any tampering with their eggs, and readily detect imposition. Dr. T. M Brower removed three eggs from one of their nests and left three robin's eggs. In a few moments the female approached, gave the contents of the nest a hasty survey, and immediately flew off. She returned in a short time in company with her mate, and both flew to the nest, apparently in the greatest rage, took each an egg in their claws and dashed it against the ground at the distance of more than a rod from the nest, the female repeating the same to the other egg. This done, they continued to vent their rage on the broken eggs, and afterward forsook the nest. Not more than one brood is usually raised in the Northern States, although beginning so early, but South two are brought up in a season.

The young are fed upon the larvæ of various beetles and other insects, and eat an enormous quantity of these grubs, with a desert of small, soft berries. Their bellies become distended until they almost burst and lose all semblance to the bodies of birds. Yet, whenever they hear the mother's call, or an imitation of it, they will open wide their gaping, yellow mouths for more. It is some days, however, before they learn their parents' voices. They breed well in aviaries, and the young are raised in the same manner and upon the same food as mocking-birds.

The Texas thrasher (var *longirostris*) is a darker race, inhabiting eastern Mexico, and northward to the Rio Grande. Its nest is placed in the tops of bushes and is rudely constructed of sticks. The eggs measure 1.13 by .79, and are indistinguishable from those of the eastern thrasher, except that the spots are larger.

CHIPMONKS IN THE BLACK HILLS.—Chipmunks, or ground squirrels, are thicker here than fleas in Egypt, and are the pests of society. They live under log, stone, and brush pile; they are worse than office-holders in Washington; they are a heavier burden than the internal revenue tax: they will invade a miner's sanctum by day and by night; they will come in tens and fifties and hundreds, and bring their families with them: they eat open the flour sacks and spill all the flour; they will steal your sugar, pack off your coffee, nibble your bread into crumbs, defile your beef-steak, tear up your letters, hide your only pair of socks, and take all the starch out of your Sunday shirt, and make themselves generally disagreeable. The miners first adopted the plan of shooting their heads off, and found for every chipmonk that was killed one day there would be ten hungry relatives applying for his situation before sun-up the next morning.

TYPOGRAPHICAL ERRORS.—Our attention has kindly been called by our correspondent, Mr. E. Brooks Gleason, to a typographical error in a recent note on the King duck *Somateria spectabilis*, taken a short time ago near Syracuse by Mr. Fred. Howlett. The generic name in the cutting from which we quoted was given as *Fuligula*, but in its transfer to our columns it got badly mixed. It is true, as Mr Gleason suggests, that the King eider occasionally occurs as far south as New York, but is also true that such occurrences are of extreme rarity, and the bird can scarcely be regarded as a regular winter visitant south of Massachusetts. Several years close watch of the New York markets has failed to secure us a specimen, though in that time many specimens of *Somateria mollissima* were noticed. In the note, as originally printed, our intention was to give prominence to the fact, that the bird has been taken so far from the sea coast rather than that it had come so far south.

NESTING OF THE ROSE-BREASTED GROSBEAK.

(*Goniaphea ludoviciana.*)

While out collecting on the 20th of May, 1871, my attention was attracted by two male Grosbeak's quarreling; they were soon joined by a female, and with her help, one of the males was before long driven away. The pair now flew to a tree, where I soon discovered a nest, so, after shooting them I ascended the tree to secure the nest and eggs. Much to my surprise, I found the eggs to be different from any I had previously found. The nest was built in a large, maple tree, about twenty-five feet from the ground, and was composed of slender twigs lined with fine grass; the eggs were four in number, measuring 1x.75 inches; the ground color was *pure white*, marked with small spots and dashes of brown. Again, on the 14th day of May, 1873, I took a nest with similar eggs, but the nest was entirely different, being composed of very coarse grass, and was a large, bulky affair, measuring outside, nine inches; inside, three inches; depth outside, five inches: inside, two and a half inches; built on a clump of bushes about three feet from the ground. ADOLPHE B. COVERT.

EELS CONSTRUCTING DAMS.

NEW YORK, March 27, 1877.

EDITOR FOREST AND STREAM.

An article in your last issue, headed "Curious Habit of a Catfish," was extremely interesting and new to me. Such facts, when well authenticated, are very valuable, adding to our limited knowledge of the habits of many kinds of fish. I suppose the catfish spoken of must have been a distinct variety, and not the common cat of the southern and western rivers. I trust that between Prof. Baird and his correspondent this point may be satisfactorily settled.

I now wish to state a fact which came under my own observation, and one that I regarded as rather curious. Did you ever, Mr. Editor, know of fish imitating the beaver and building dams across streams? Whether you have or not, I once witnessed that fact. One summer day some three or four years since I was following up a trout stream whose waters fall into the Housatonic River, Conn. This brook was quite crooked, and its bed in some places consisted of clean sand and small pebbles while in other places it flowed over stones of various sizes, which were more or less smoothed and rounded by the action of running water. As I walked along, I came to a broad, shallow pool through which the stream flowed with a smooth, even, and slower current than it did in other places. As I arrived at the lower end of this pool I stopped, hesitating, and trying to make up my mind whether to cross the stream at that point or not. Happening to look into the pool I saw an eel about twenty-eight inches long, in the act of swimming up-stream, as I then thought; but before I had time to more than get a fair look at it, it stopped its wriggling motions and its head slowly sank down to the bottom. But no sooner had it reached this position than it commenced its struggles again, and I then saw that it was slowly making its way backward down-stream with something attached to its head, which upon close inspection I discovered to be a smooth stone about the size of a goose's egg. It would struggle and raise the stone from the bottom, the current at the same time assisting to carry it down-stream, and as the stone would soon sink again to the bottom, the fish would rest only until the current had swung it into the line of its course, when it would repeat its efforts. As it neared the lower end of the pool I noticed that a wall or dam of stones was placed across the brook. They varied in size, some being no larger than a hickory nut, and others looking as though they would weigh three or four pounds. This dam was about 18 inches wide at the bottom, and perhaps 12 inches high at the deepest place. The top was as nearly water level as it could be made. The eel, who kept its tail well elevated toward the surface, no sooner touched the dam than it gave a powerful struggle, and lifted the stone so that it landed on the dam about two-thirds of the way up, while the body of the fish went over and partly below the dam, over which less than two inches of water was flowing, with a fall of some seven or eight inches. As the fish went over the top of the dam it was partly out of the water, and I then saw that it was a lamprey and not a common eel. It made another effort and dragged the stone to a position nearly on the top of the dam, and then seeming to be satisfied with its position, it let go and dashed forward into the pool again, and swimming along more slowly soon selected another stone, which was soon on its way to join the one I had just seen placed. I watched it for some time, and I assure you it worked with beaver-like energy and persistence. It had already placed three or four bushels of stones in position, and succeeded in raising the water in the pool several inches; but for what purpose? Was the dam itself to be a hatching-house or nursery for its fry? or was it merely to insure for itself a greater quantity of water for its comfort and enjoyment? These questions I leave to others better informed than I am about the habits of the lamprey to answer. It was *a fact*, and as such I give it, to be preserved if worth it. HALCYON.

SOME NEWFOUNDLAND BIRDS.

HARBOR GRACE, Feb. 14, 1877.

EDITOR FOREST AND STREAM.

Of a morning standing on the shores of a lake one will hear a whistle, which I might well express by telegraphic signals, as ——

— — ....., one long note, three short notes, and six dots. I heard first that it was called the Lone bird, but its real name is whip-poor-will. What is its Latin name? I have often tried to see it, but cannot. My own name for it is the Telegraph bird. Our snow-bird or ortolan, I believe, visited us the other day in considerable flocks. It is of a white color: he speaks by one short note. How often when a boy we caught this bird in a trap formed of a cinder riddle, support stick, and line!

The little tomtit also visits us in flocks, and a friend of mine here says they will come and get food near his parlor window, which is quite complimentary to the gentle hearts of his young ladies. The jay is another bird here; he is gray and white. We have two prominent species of owls—the white and the small gray, or the cat-owl. Some years ago two hawks were in the habit during the winter of visiting the harbor, and as sure as ever they came we always had heavy weather shortly thereafter. Being connected with the meteorological service we take a deep interest in the signs of birds, which are often wiser than men. We can't shoot partridge now, because the law is against it, and we are strongly of opinion that every sportsman should make it a matter of honor to obey this law. C.

[The Latin name of the whip-poor-will is *Antrostomus vociferus;* but is it to this bird that he refers?—Ed.]

THE BIRDS OF WEBSTER, NEW HAMPSHIRE, AND ADJOINING TOWNS.

BY CHARLES F. GOODHUE.

Continued from our issue of March 29th.

TETRAONIDÆ—THE GROUSE.

Bonasa umbellus. Ruffed grouse. Common resident; breeds. This bird does great damage to apple trees in winter, by picking off the buds; have seen seven in one small orchard at once, and this not more than ten rods from the house.

PERDICIDÆ—THE PARTRIDGES.

Ortyx virginiana. Quail. Rare resident; probably breeds.

SCOLOPASIDÆ—THE SNIPES.

Philohela minor. Woodcock. Common summer resident; breeds. When they first arrive in the spring, the male will sit on the ground in the evening and make his peculiar note, which sounds like the night hawk, something like the syllable *sneap.* This he continues for several minutes, when he rises on the wing with a sharp whistling sound to a great height, flying in large circles. This is continued for a few minutes, when he descends to nearly the same place. This is repeated until it is quite dark. I have never heard of any one speak of this before, but the habit is such as I have described it.

Gallinago Wilsonii. English snipe. Not common until this fall, 1876; they stayed until the ground froze.

Rhyacophilus solitarius. Solitary sandpiper. Common summer resident; breeds.

Actiturus bartramius. Upland plover. Same as preceding.

ARDEIDÆ—THE HERONS.

Ardea herodias. Great blue heron. Common summer resident; may breed now; did a few years ago.

Botaurus lentiginosus. Bittern—Dunkadow. Common in summer; probably breeds, but have never been able to find its nest, though I have looked for it carefully.

Butorides virescens. Green heron. Not a common summer resident.

ANATIDÆ—THE GEESE, DUCKS, ETC.

Bernicla canadensis. Wild goose. Spring and autumn migrant.

Anas obscura. Black duck. Summer resident; breeds.

Aix sponsa. Wood duck. Same as the preceding, but more common.

Querquedula discors. Blue-winged teal. Not common in the migrations.

Mergus americanus. Sheldrake. Common in the migrations.

Lophodytes cucullatus. Hooded merganser. Rare in the migrations.

COLYMBIDÆ—THE LOONS AND DIVERS.

Colymbus torquatus. Great Northern diver. Common summer resident; may breed, did years ago.

Colymbus septentrionalis. Red-throated diver; very rare, perhaps accidental; have known of its being found here but once—adult male, in the fall of 1876.

PODICIPIDÆ—THE GREBES.

Podiceps Holbollii. Red-necked grebe. Accidental, from the coast. There were some five or six specimens taken this last spring (1876), and I shot a specimen in the river in June. This is the only time I have known of its being taken in this section.

Podilymbus podiceps. Prod-billed grebe. Not a common summer resident.

[The habit of the woodcock, mentioned by our correspondent is well known, and has been noticed by more than one ornithological writer.—Ed.]

A HEARTLESS PARENT.—The following somewhat apocryphal story comes to us from the *Chronique de la Société d'Acclimation;* our readers can believe it—if they want to: In the Transvaal Republic the coffee plantations are much exposed to the ravages of large cynocephalic apes, and a good guard has to be kept in order not to loose, through these animals, the fruits of long labor. Among the coffee-trees there grows a shrub (whose scientific name the writer did not know), the fruits of which are borne very close to the trunk. A species of wasp, whose sting is very painful, had chosen several of these shrubs to attach their nests to, and the baboons had often been observed casting envious glances toward the fruit, but not daring to touch it for fear of getting stung. One fine morning the planter heard terrible cries, and with the aid of a good opera-glass he witnessed the following scene: A large, venerable baboon, chief of the band, was laying hold of young apes, and pitching them into the shrub, and he was doing this again and again, in spite of the most piteous cries and groans. The shock brought down the nests of the wasps, which attacked the poor victims in swarms, and during this time the old wretch proceeded quietly to feed on the fruits, deigning occasionally to throw the remains to some females and young a little way off.

THE NEW YORK ACCLIMATIZATION SOCIETY.—At a meeting of the Directors of the Blooming Grove Park Association, held at the Hoffman House, April 5, 1877, the inclosed resolution was offered and passed unanimously:

Whereas, The Blooming Grove Park Association, by their Charter from the State of Pennsylvania, has been created for the purpose of acclimatizing and domesticating any foreign as well as American species of animals, birds, plants, or fishes; therefore, be it

Resolved, That our Association, in hopes of furthering the said object, do hereby extend to the American Acclimatization Society of New York the free use of our grounds for acclimatizing any of the above named species they may desire to introduce, and will in such case receive and give them the necessary care, attention, and protection requisite for their preservation, domestication, and successful acclimatization.

It is to be hoped that this combination may produce results that will do credit to the mutual enterprise and to the country at large. We shall refer to this subject hereafter at length.

Woodland, Farm and Garden.

REGRAFTING OLD FRUIT TREES.

THERE is scarcely a country home that has not a few old and worthless apple or pear trees on it, that perhaps bearing a few fruit every year, the owner does not wish to destroy, and which could yet be easily made a source of pleasure and profit at a very slight expense. Grafting is not difficult by any means, though it is not easy to describe without drawings the *modus operandi* of the various methods. The simplest, most commonly practiced, and perhaps as good a plan as any, is called cleft grafting. The limb being cut carefully off so as not to tear the bark, is split through the centre, and the split being kept open by a small wedge in the centre, the scion (about three inches long of last season's wood will do) is cut with a sharp knife wedge-shaped, one side being a little thicker than the other, and inserted, one on each side of the branch if large, particular care being taken that the inner edges of both barks match each other, then cover carefully with wax or waxed cloth so as to exclude the air, and the deed is done. The wax is easily prepared by melting two parts tallow, two parts rosin, and three parts beeswax, very gradually over a slow fire, carefully stirring it all the time. It will keep for years and should be kept covered up. A most exhaustive article on grafting, well illustrated, appeared in the *American Agriculturist* for April, page 123. There are quite a variety of tools manufactured to assist the cultivator, many of them of great practical utility—Wagener's improved grafting saw and scion cutter being the latest, and if it prove to be all that is claimed for it, it will be a great boon to those who have much grafting to do, as it cuts a mortise for the scion and then cuts the scion exactly to fit the mortise. Scions can be had of any nurseryman, and for six apples ripening at different periods, *Maiden's Blush, Fall Pippin, Early Joe, Spitzenberg Northern Spy,* and *Baldwin* are also good sorts; while *Bartlett, Seckel, Duchess d'Angoulême, Louise Bonne de Jersey,* and *Flemish Beauty,* all first-rate sorts of pears, will give a supply for several months. W. J. D.

NEW YORK HORTICULTURAL SOCIETY.—We have again great pleasure in noting the increasing interest taken in horticultural matters in New York, from the large attendance at the regular monthly meeting of the above society at its rooms, 55 West 33d Street, on Tuesday, the 3d ult. Mr. W. C. Wilson, Astoria, L. I., sent some noble specimens of Palms and Tree Ferns to decorate the room, while the smaller plants and cut flowers were arranged in groups, or placed on the tables, where they would show to the best advantage. Fourteen new members were elected, and after the report of the finance committee for 1876 was read and accepted, Mr. David Foulis read a very instructive paper on "Ornamental designs in Cut flowers," giving first a very full list of the plants and flowers most generally grown for that purpose, followed by very lucid and practical remarks on the best and most natural methods of arranging them. The following premiums were awarded: To James Riddle, gardener; to Mrs. Elisha Brooks, Inwood, for six Cinerarias and a fine large pan of Boyden's No. 30 strawberry in fruit; to H. Herbert Reynolds, Flatbush, L. I., for six Scarlet Geraniums; to R. B. Parsons, Flushing, for Azaleas; to Charles Zeller, Flatbush, for Cut Flowers; to Geo. Such, South Amboy, for Azaleas, and Orchids; to William Bennett, Flatbush, for thirty splendid plants of *Lilium longiflorum* with from eight to twelve flowers on each; and to William A. Burgess, Glencove, for a magnificent basket over two feet in diameter of Marechal Neil roses.

In addition to the regular monthly meeting on May 1st, the society will hold their semi-annual exhibition at Gilmore's Garden on May 29th, 30th, and 31st. The liberal schedule of premiums offered (over $1,000) should induce amateurs as well as growers to contribute largely, and make this exhibition a still greater success than that of last season. The schedule of premiums or any information about the society can be had of the secretary, W. I. Davidson, Box 191, Brooklyn, N. Y.

SOME TEXAS PASTURES.—A correspondent of the Galveston *News* writes to know if Texas is as wild as it was twenty years ago, and if it is really true that stock is raised in inclosed pastures there. People were in doubt about it, it appears. Their doubts will be removed by the editor's answer. There are innumerable enclosed pastures in Texas, many of them gigantic in size, and in which feed and thrive countless numbers of cattle, horses, sheep, and goats. For the benefit of our correspondent and his incredulous friends, we enumerate a few of the largest inclosures.

Messrs. Coleman, Mathias & Fulton have in Aransas, San Pantricio, and Nueces Counties, pastures under fence inclosing 200,428 acres: Capt. Kennedy has, to the southwest of Corpus Christi, 133,000: and Capt. King 175,000. In the same vicinity other parties have, in the aggregate, 209,000 acres; in Calhoun County there are 69,000 acres belonging to different parties. In Refugio County there are 83,000 acres. McCampbell & Bros. near Rockport, have 30,000 acres: John Woods, near St. Mary's, has 65,000 acres; Thomas O'Connor 40,000; John Welder has 28,000 acres; Henry Scott has 15,000 acres; Jerry O'Driscoll has 20,000, the last four all in Refugio County. In Bee County, sundry persons have 42,000 acres; and in Atascosa County 75,000 acres. In Live Oak County there are 80,000 acres; in Victoria County, 45,000 acres. Mr. Butler has, in Galveston and Harris Counties, 60,000 acres: Mr. Sam Allen, in the same two counties, has 120,000 acres. Mr. Kuram, in Jackson, has 75,000 acres; Pierre, Vayle & Co., same county, have 30,000 acres; and sundry persons in that and adjoining counties, 160,000 acres. West of San Antonio and in other parts of the State there are many large inclosed pastures, the owners and dimensions of which cannot be given. We hope enough has been said to satisfy the incredulous gentleman of St Louis that there are a few pastures in Texas, and that some of them are something more than horse lots or cow pens, such as exist in Missouri and other less favored States than Texas.

LICE ON CATTLE.—This subject is disturbing the peace of the farmers at present. We have given several recipes—some of our own, some borrowed from contemporaries. In the *Country Gentleman* of April 4th are several new ones furnished by correspondents. One recommends sifting ground plaster along the back and neck:

"Two or three applications did the work effectually. The plaster should be very fine and dry. Another method used with great satisfaction is carbolic acid. One ounce of carbolic crystals, one pound of common bar soap, melted together by the addition of a little water. Let an animal be washed in a strong suds made with this, and it is sure death to all parasites, and will cure all skin diseases. Both these remedies are simple, harmless, and effectual. Lice will live for a long time in the wood work about the barn; it is a good plan to whitewash about the lean-to, and prevent their spreading in that way."

Here is an internal remedy guaranteed to kill the lice without killing the cattle:

Give a teaspoonful or so of sulphur at intervals of a day or two, and apply lard with kerosene oil enough to thin it so as to rub it in easily cold, with a little sulphur in, the lice will die or leave in disgust. Usually the internal remedy will suffice. There are cattle, however, that seem to breed lice, as they will return again and again, after the most heroic treatment, and while the remainder of the herd are clean. A little sulphur in the meal will sicken hen lice also."

A third correspondent says:

"Twist lightly a few strands of yarn, and draw through mercurial ointment until thoroughly saturated; tie this around the animal's neck tolerably tight, and it will kill every louse on it in a short time."

We believe mercurial ointment to be very efficacious.

Again:

"Put two quarts of air-slaked lime into a cotton cloth bag, and shake it over the cattle, whipping them lightly with it under the belly and between the legs."

THE DESTRUCTION OF WOODS.—In the able report upon Chili by Mr. Rumbold, to which we lately referred, we find some remarks on the effect that has been produced by the destruction of the woods that formerly covered the country, which are well deserving of attention. During the past thirty years an extraordinary extension of agriculture has occurred in Chili. Formerly she was an importer of corn, now she is a large exporter. The first impetus was given by the discovery of gold in California; a great demand for wheat arose, and Chili set to work to supply it. Then the discovery of gold in Australia opened a new and profitable market, and now Peru offers another outlet. In their eagerness to produce wheat and barley, the peasants recklessly burned down the woods on the lower Cordilleras near the coast. The progress of mining led to the same result in the valleys of the main chain of the Andes; the consequence of this unwooding has been to deprive the country of its due rain-fall and to threaten the soil with sterility. Thirty years ago, Mr. Rumbold tells us, travelers posting between Valparaiso and Santiago—a distance of only ninety miles—were sometimes in winter detained as many as five days by the swollen state of the rivers and the heaviness of the roads, and it regularly took bullock carts a month to make the journey. In 1872 "there were 325 dry days, of which 233 were entirely cloudless and 102 either partially or entirely overcast. There was much rain on nineteen, and it was showery on twelve out of the remaining thirty-one days. In 1873, when the winter was more severe, the rainy days amounted to twenty-five and the showery days to eleven." The result is, that one, whom Mr. Rumbold describes as a great authority, speaks of "the sterility which is invading with alarming rapidity the fields of the central region, now devoid of woods, and the slopes of the hills robbed of the vegetable soil, while nothing now prevents the rains from washing down into the valleys."—*London Economist.*

TO CORRESPONDENTS.

EDITOR FOREST AND STREAM.

SIR: Do you think you could find room in FOREST AND STREAM for the inclosed letter relating to the writings of Mr. Barton Wallop? and would you add to your former courtesies by naming the two plants I send, if you can do so from such imperfect specimens? One of them is, I think, the common cockle-bur, *Xanthium.* I am, dear sir, yours,

X.

X.—There is no doubt that the larger of the two specimens sent for name is *Amaranthus albus,* L., a very rank-growing weed in rich ground, and showing its tropical derivation by growing best in the hottest weather; there being only the seed vessels of the other specimen left, it is impossible to determine what it is. Could not our correspondent forward a specimen with flower and leaf.

J.—EPIGÆA REPENS, L. Ground Laurel or Trailing Arbutus; in New England called MAY FLOWER.

A CARD.

To the public, and especially to those whom it may immediately concern.

Encouraged by some kind friends, and in hopes to benefit myself and those dependent upon me for support, and also in hopes to benefit the State and people of Florida, where and with whom I have contracted so many warm ties of friendship, I recently associated myself with a scheme called the "Florida Home Association," having for its object the inducement to purchase and improve lands in Florida, under a scheme operated by the sale of tickets, several of which tickets have been sold.

But more mature reflection, on investigation, and the advice of those better able to comprehend the working of such a scheme, and the necessary preparations and details for making the same a success as a business matter, and properly certain and just toward those who have or should become the purchasers of tickets, I am convinced my efforts cannot be made to realize the hopes of myself or the just expectations of others (at all events, as at present proposed and arranged), and I therefore feel it to be a duty to myself and justice to others to abandon the project and my connection therewith. Those who were so kind as to purchase tickets will have their money refunded to them, and to the good friends who were pleased to proffer me their aid in supplying the land designed to be allotted under the scheme now abandoned, in releasing them from their engagements, I beg to bestow upon them all that a grateful heart can utter—my warmest thanks.

MRS. M. A. BAILOR.

Jacksonville, March 16, 1877.

—By an unfortunate error in printing the first copies of the Special Prize List, Mr. Dudley Olcott's cup for the best English setter dog or bitch out of a native bitch by an imported dog, the value of the cup was put at $50, whereas it should have been $100.

—Mr. C. Z. Miley's red Irish setter bitch, Floss, has visited his imported red Irish setter dog, Buck.

—Mr. Wm. Jarvis, of Claremont, N. H., writes us that Elcho has visited Kathleen.

—Mr. Allen Dodge's (of Georgetown, D. C.,) liver-colored pointer bitch Dolly whelped, on March 17th, twelve puppies, eight bitches and four dogs, mainly lemon and white, by Sensation.

ACKNOWLEDGMENTS.—From Kinney Bro's., Tobacco Manufacturers, 141 W. B'dway, a box of delightful cigarettes and smoking tobacco. This firm is well-known, and their goods are in great request by smokers. One of our editorial staff who does not smoke did these gentlemen great injustice a week or two ago, by informing an inquiring correspondent that he did not know the address of the house of K. & Bro. We have before us the most delightful evidence of its existence, and shall take pleasure in informing our friends of its whereabouts.

C. L. Ritzman & Co., 946 Broadway, have received an order for a duplicate gun, for a Mr. Lane, which has attracted much attention as a beautiful specimen of workmanship and effective weapon. Both Mr. Ritzman and his patron are deservedly proud of it.

Gregg & Co., of St. Louis, Mo., have sent us a box of the artificial angle worms, such as we have repeatedly noticed. They resemble the real thing very much, and a cullud acquaintance of ours who has had them in his mouth, says they "*taste* mighty like 'em, too, boss."

—Don't spend your money foolishly in trifles, because that will infallibly lead you to be foolish in larger expenditures. For instance, in the matter of toilet soaps. By purchasing B. T. Babbitt's Toilet Soap you get absolutely the finest that can be manufactured and the most economical; for it goes much further than the ordinary scented soaps, that come to us with pretentious labels, and are really but whited sepulchres.—*Adv.*

New Publications.

LIFE OF GEN. GEO. A. CUSTER. By Frederick Whittaker. Sheldon & Co., New York.

This is a biography of the gallant general whose services in the field have won universal admiration, as his untimely death in the prime of his life and usefulness has the regret and sympathy of the world. The author is an army officer whose familiarity with his subject has enabled him to produce a volume of a quality that has already secured for it a sale of 10,000 copies, if we are not misinformed.

The first chapter of the book treats of Custer's boyhood and youth; the second to the fifth treat of his services during the war of the Rebellion; the sixth of his services in Texas and elsewhere, up to the year 1867, mentioning incidentally his love for hunting and other out-of-door pastimes, which his temporary residence in Texas enabled him to avail himself of. During this period, the book says, he "had accumulated a pack of some twenty fox-hounds, for he was a great admirer of dogs and a connoisseur of breeds. When the fox-hound pack of Texas was broken up, except one or two of the finest dogs, which he afterward took to Monroe, Mich. (the record runs), he became wonderfully interested in the Scotch deerhound, of which he saw one or two specimens. He ended by buying a pair, bred in Canada from imported dogs, and afterward received a present of another, an imported dog. From these others were afterward bred, so that in a few years he possessed quite a pack of these dogs, besides fox-hounds, setters, spaniels, and others. He had always managed to have dogs at all periods of his career even, when as a lieutenant he took old 'Rose' to Washington with him, but as soon as he was able to indulge his fancy freely, he perfectly revelled in the collection of animals, having as many and varied a pack as used to attend Sir Walter Scott at Abbotsford in days gone by."

Chapter seven is very interesting, being devoted to details of his Indian campaigns and sporting life on the Plains; chapter eight is occupied by a history of his last and terribly fatal campaign; the ninth chapter is devoted to a general review of his life as a soldier and a man, and an analysis of his continued and unqualified success; and the tenth and last chapter to personal reminiscences by Lawrence Barrett.

This book should be bought and preserved as a souvenir by every one who admires talent, bravery, and manly qualities, especially in their relation and application to one of our most popular and esteemed army officers. The illustrations include admirable portraits of Gen. Custer and his luckless relatives who fell with him in the last Indian battle, and of the celebrated Indian chiefs, Satanta and Rain-in-the-Face. The book contains 687 pages.

HELMICK'S HARD TIMES TREASURY. We have received from F. W. Helmick, 50 West Fourth Street, Cincinnati, Ohio, a musical portfolio containing ten comic songs, adapted for the piano or organ, which the publishers will send by mail free of charge on receipt of $1. It is hardly necessary to say that the selections would have to be poor indeed not to be worth the trifling sum asked.

ORNITHOLOGISTS' DIRECTORY. S. L. Willard & Co., of Utica, have recently issued a small publication, which contains the names of taxidermists and egg collectors in various parts of this country and Europe. Besides, it contains a list of valuable works of reference, and other matters of general interest and usefulness to students and naturalists.

HERBERT'S WORKS. It will please many of our readers to know that Messrs. T. B. Peterson & Brothers have issued cheap editions of some of the most popular of "Frank Forrester's" works. We have received "My Shooting Box," "Warwick Woodlands," "Quorndon Hounds," and "Deer Stalkers." These sell at 75 cents each, but they can also be had in two volumes handsomely bound for $4.

PHELAN'S CHECKER PLAYER.—The game of checkers has assumed such a place among games, that we doubt not there are a large number of persons who will be pleased to meet with the Messrs. Phelan's neat little magazine, which is to be devoted entirely to the interests of checker playing. We have received the April number, and should judge that it contained all that could be desired. The publishers are Messrs. Phelan & Bros., No. 510 West Fifty-seventh Street, New York.

Lippincott's for April is of more than usual interest. "The Tartar and His Home," and the "Valley of Peen," are most graphically pictured. "The Chapter of Real Life" is no doubt the experience of many unfortunate emigrants who arrive in this country without settled plans. The readers of *Lippincott* will regret to part from "Young Aloys, the Gaelk from America," so soon—charmingly written by Auerbach, full of truth and nature. "The Marquis of Lossie" promises to be one of MacDonald's crow ing efforts. Miss Lazarus' "Will of the Wisp" is extremely good, and leads us to expect great things from her pen; and we might also say the same of Miss Hilliard. The usual "Monthly Gossip" and literary criticism conclude the number.

Answers To Correspondents

No Notice Taken of Anonymous Communications.

C. E. C., Boston.—Where can I buy and what would be the cost of a small birch-bark canoe, one large enough to hold two persons? Ans. Address Fitz Cochran, Halifax, Nova Scotia; or David Dresser, Princeton, Maine. Cost about $16.

J. A. L., Philadelphia.—Will you please inform me of the best trout streams in Pennsylvania, and during which month I would find the best fishing in them? Ans. In McKean, Potter, Elk, and Pike Counties in May and June.

MAX, Clearfield, Pa.—What is proper dose of santonine for a large setter, to kill worms, and how is it administered? Ans. Two grains morning and night, and on the fifth day a large dose of castor oil. The santonine can be given in the dog's food.

T. W. J., Kane, Pa.—Is it not a little out of order for trout to be caught in the streams of Cameron County, this State, in the month of March? One party at Emporium, Pa., claims the honor of catching several the past week weighing over two pounds each.

BAGSTOCK, Montreal.—Could you oblige me with the name and address of several of your best race boat builders (row boats)? Ans. Stephen Roberts, No. 368 South Street, N. Y.; Thomas Fearon, Yonkers, N. Y.; C. B. Elliott, Greenpoint, N. Y.; Wm. Blaikie, Cambridge, Mass.

G. W. R., Waynesburg, Pa.—I send you the head of a snipe. Please say what kind it is. They have just come. I killed this one to-day. Ans. The head is that of the Wilson or American snipe, erroneously termed English. They are now migrating to their northern breeding grounds.

J. H. B., Meshoppen.—1st. Will wild rice grow in this climate? 2d. What time of year does it want to be sown? 3d. How long would it be (after planting) before it would serve as food for ducks? Ans. 1st. Yes. 2d. Both spring and fall. 3d. The same season. See answer to H. R. B. in issue of March 15th.

READER, Uniontown, Pa.—What will it cost to get one barrel in each of three guns choke-bored, to make a pattern of about 240 pellets, No. 6 shot, in a 30 inch circle, at 40 yards? Do you consider that an extreme or moderate choke? Ans. About $5 each to have the pattern guaranteed. It will be called a full choke.

H. G. P., N. Y.—Can you or any of your readers give me any information, names, etc., regarding a brace of setters imported by Robt. Hawkins of Hoboken, in about 1868, one of which is now stuffed and in some club-house in this city? Ans. We do not know, but perhaps some of our readers can supply the information.

M. H. B., Greenville, Pa.—Are there any rules in regard to shooting glass balls? Do they have to be broken in the air? If the neck of a ball is found to be broken by shot, is it scored for or against the shooter? Ans. We have sent you the Bogardus rules. The ball itself must be broken to count.

C. S. O., Philadelphia.—What place would you recommend me to go to for a two weeks' hunt in the first two weeks of August, and would you recommend Squan Beach, N. J., and if so, what birds could I find there at that time? Ans. The only shooting you could get at that time would be bay birds, and Squan Beach would be a very good place.

J. N., New York.—I have in my possession a pup (dog) two months old, a cross of water spaniel and shepherd dog; color, white and red. Do you think he can be made of any use in the field or duck shooting? If so, at what age would it be best to break him? Ans. Your dog could only be used as a retriever. You should commence breaking him when he is six months old.

J. S. R., Philadelphia.—1st. Can steam be seen? 2d. What is it we see coming from the exhaust of an engine, steam or watery vapor? 3d. Which is the motor, steam or watery vapor such as we see coming from the exhaust? Ans. 1st. If you had ever observed one of the small engines made of glass, sometimes exhibited by glass-blowers, you would have noticed that no steam could be seen in the boiler. 2d. Watery vapor. 3d. Steam.

R. A. G., Pittsburg.—I have a pointer dog two years old whose nose keeps running a thick, white discharge; for about six months it stopped, then started running again, and has been running ever since? Ans. Give your dog a mild laxative to open his bowels and then commence a thorough course of tonic treatment. Give cod-liver oil, a tablespoonful twice or three times a day, and quinine and tincture iron in small doses, or for quinine you can substitute sulph. cinchona in five grain doses.

H. A. H., Brooklyn.—I have been ordered out of town on account of my eyes. Where can I go inland that I may get plenty of fishing and boating, together with good accommodations at reasonable price? I wish to leave as soon as possible, and stay say three months or longer. Ans. We should recommend Greenwood Lake, but there will not be much fishing for two months yet. Milford, Pa., would be a good place, as you could get some trout fishing.

E. C., Albany.—Will you please inform me where I can procure a copy of the game laws of New York State? Also the price of the same? A friend of mine has an artificial trout pond, but says his fish die off in great numbers. What is the cause of it? Ans. Have sent you a copy of game laws. Your fish die because the water is too warm or otherwise deleterious; or because there is decayed animal or vegetable matter in the pond; or because they have not been properly fed; or possibly because they have been handled.

AVIS, Utica, New York.—1st. Is Archæology considered a natural or applied science? 2d. Is Philology a natural or applied science? 3d. What science does Dr. Le Conte, of Philadelphia, study? Ans. 1st. Archæology and Philology are certainly not applied sciences. Whether they come strictly under the head of natural sciences we are not prepared at the moment to say. 3d. Prof. John LeConte, of Philadelphia, is an entomologist, and we believe makes the *Coleoptera* his specialty.

E. W. L., Philadelphia.—Can you inform me where a party of four can spend a couple of weeks (the last two in June) fishing? We want to camp; have been recommended to Porter's Lake, Pike County, Pa. Can you give me any information in reference to this lake? Ans. Porter's Lake is a large sheet of water well stocked with black bass and pickerel? Take Erie Railroad to Hawley, and wagon from there. It is a favorite place for camping. There are trout within a few miles. Good territory all through Pike County for sportsmen.

W. S., Rouse's Point, N. Y.—1st. I have a spaniel whose urine comes from him as red as blood, and his eyes have a watery discharge. What is the matter with him? 2d. What do you think of Mr. M. P. McKoon's cockers, and do you know of a better place to get them? Ans. 1st. Your dog has haematuria; give him one teaspoonful of sweet spirits of nitre three times a day, also five grains of gallic acid in capsules three times a day until the water becomes clear. 2d. We have not seen Mr. McKoon's cockers, but believe them to be very good.

N. H. B., Pontiac, Mich.—1st. I have a setter dog about 17 months old; about three or four months ago he commenced to have a peculiar hacking dry cough; sometimes he will vomit considerable slime. With this exception he has no signs of sickness. Can you tell me what is the matter with him and suggest a remedy? 2d. What can we do to get the lice from a canary? Ans. 1st. Your dog has taken a cold which has probably affected his lungs. The vomiting is caused by the excessive coughing. Give him cod liver oil and tincture of iron as suggested to (E. A. G.) in this column, and good nourishment. A Dovers powder night and morning, for ten days, would probably relieve him. 2d. Try sulphur dust under his wings.

JERSEY, Newark.—Symptoms too long to print. Give your dog—If he is not improving on treatment sent by mail—two tablespoonsful of Hoffman's solution of meat every two hours during the day; also five grains sulphate quinine and ten drops tincture of iron three times a day. After the dog has taken two pots of meat, give him a tablespoonful or two of cod liver oil three times a day. The meat can be had at Hoffman's, Forty-fifth Street and Sixth Avenue, this city. This treatment is for a dog debilitated by a severe attack of distemper, with apparent inflammation of the intestines.

C. A. F., Newport, Ky.—1st, Where can I get a good disinfectant to use in a kennel in which a dog has just died from distemper? 2d. Please tell me of what breed the following setter is: Small size; head rather sharp and liver-colored; legs liver-colored and well feathered; body straight-haired and thin-bitten, with liver-colored spots; tail inclined to crook sideways, but when held out has the right shape, and hair inclined to curl or twist, well feathered? Ans. 1st. The "Girondin" disinfectant advertised in our columns is an excellent one. 2d. Your dog is probably a native English setter.

OLD SUBSCRIBER, Nashville, Tenn.—1st. What is the circumference and how thick are the glass balls used by Bogardus in his matches? 2d. Can they be bought this side of New York, and at what price? 3d. What will be the freight on 500 from New York to Nashville? Ans. 1st. The balls are about the size of large billiard balls, say 2½ inches in diameter, and a little thinner than thin bottle glass. 2d. We do not know where they can be bought out of New York. 3d. A barrel containing 400 balls weighs 100 pounds; your freight agent can tell you the rates.

C. M. S., Lawndale, Logan Co., Ill.—1st. Will you please give me the address of the Spencer Manufacturing Company—that is, if they use a central-fire cartridge? If they do not I care nothing about them. I want to find a magazine rifle that uses powder and lead enough to do execution among large game. 2d. What length and calibre military rifle (Rem.) is used at Creedmoor most? Ans. 1st. There is no Spencer Manufacturing Co. now, and they never used or made central-fire cartridges. The only magazine rifles now made are the Winchester and Evans. 2d. Remington, 50 cal., 70 grains powder, 30-inch barrel.

W. H., Jr., New Orleans.—Can you or any of your numerous readers tell me anything about the pedigree of my black Gordon setter Snyder? He was bought by Mr. Sherman, of Duncan, Sherman & Co., New York, in Alabama, it is believed. He must be seven years old now, is black as coal, except his breast, and is called a black Gordon. Like the parents of a lost boy, any "information will be received" by his inquisitive owner, W. H. Jr., box 1,046, New Orleans, La., who proposes to enter him for the New York Bench Show. Ans. We do not know the dog Snyder, but perhaps, as he was broken North, some of our readers may.

J. C. A., 2d., Lowell.—1st. Would you please inform me through the columns of your paper the best food for the common red crossbill? 2d. Do the game laws of Minnesota prohibit shooting game in July and August, and if so, what kinds? 3d. Can the blue-bird and yellow-bird be domesticated to cage life? Ans. 1st. The food of the red crossbill consists mainly of the seeds of the various species of pine and hemlock. Give your bird a liberal supply of cones and he will find the seeds. If cones cannot be obtained try oats, buckwheat, wheat, etc. 2d. Yes, all kinds. 3d. Yes; we have had both do well in confinement, but the blue-birds at least must be reared from the nest by hand.

W. M., Savannah, Tenn.—Do the pike-perch or Ohio salmon ever rise to any? If so, what flies would be most killing? Can you tell me the names of such bass flies as would prove suitable in these waters? Also where they can be had, and at what cost. Ans. The pike-perch, white salmon, Ohio salmon, or wall-eyed pike, as it is severally called, is often taken by the same flies as the black bass. The habitat of the two fish is much the same, and they are very frequently taken in the same waters. In limestone streams like yours the combination of green and gold would kill better than an all ibis. A scarlet body and turkey wings would make an attractive lure. Your best plan is to experiment and use the fly that takes the best.

R. M. G., Washington, Pa.—Myself and friend are going to Illinois this summer for a ten days' chicken hunt. Can you advise me of the best place and time to go? and how many dogs to take to do our dogs justice? The dogs are used to hills, but do not wish to work them too hard. We thought four would be enough to take, work two at a time. What No. shot do we need? how much to use? how large charge powder? we shoot Parker gun, 12 bore? Ans. We can not tell at this date when "chickens" will be most abundant, but from all accounts, you can hardly go amiss. If you go in September four dogs will not be too many. Use No. 8 shot, changing to No. 6 later in the season. We cannot give charges of powder and shot without knowing weight of gun; probably in your case 3½ drs. powder and 1⅛ oz. shot.

J. W. C., Rouse's Point.—Will you please tell me what to do for my pointer pup, three months old? She has the mange. Should I keep her in a warm place? or will it hurt her to go out in the daytime? Also will my spaniel pup catch the mange by playing with her? I do not let them sleep together. Ans. Wash your dog well with carbolic soap, and when thoroughly dry apply the following ointment: Take of Basilicon ointment 2 ounces; flour of sulphur ½ ounce; spirits turpentine enough to make of the proper consistency. Feed little or no meat, and when the weather is fine let your dog be out of doors as much as possible. If you wash your spaniel occasionally with carbolic soap, and do not allow him to be too much in contact with the other dog, he will probably not take the mange.

A READER, Schenectady, N. Y.—My pointer pup, two months old, has been troubled for four or five days with a weakness of the knee joints, the knees springing forward like those of a badly "knee-sprung" horse, and trembling excessively when standing. He appears well otherwise, nose cold, lively, and playful, with perhaps not quite as good an appetite as he ought to have. He was taken from the dam but about ten days ago; since which he has been fed principally upon cornmeal mush, in which a few scraps of meat had been boiled, and milk. Ans. The probability is that your puppy has worms. We should give him about 20 grains areca nut in three doses, followed by a teaspoonful of castor oil. Keep him warm and dry, and feed oatmeal and milk.

A. F. B., Providence.—Has the book called "Birds of New England," by Mr. H. D. Minot, been published? If it has, how does it compare with Mr. Samuels' work? What is the price? Is there any other work upon this subject that is more desirable? Can you inform me of any book that treats of the fish of New England, or of the United States, from the smallest and most insignificant to the largest and most important—a work that would interest the naturalist rather than the sportsman? Ans. "The Birds of New England" has been published and is for sale by the Naturalists' Agency, Salem, Mass. It is a good work. See review in No. 25, Vol. VII of FOREST AND STREAM. We know of no work devoted to this particular section of the country which is more desirable. As for the fishes, you may not live to see a complete, comprehensive work such as you speak of. For coast fishes consult Baird's "Northern Coast Fishes from Greenland to Georgia," published by the Smithsonian, 1872, and Gill's accompanying catalogue, which mentions every species, with classification, but without description. It contains a bibliography which refers to all works published on coast and inland fishes.

UNDOUBTEDLY one of the best and cheapest stocks of Carpetings, Oil-Cloths, Mattings, etc., etc., to be found in the United States is that of Messrs. JOHN H. PRAY, SONS & CO., Washington Street, Boston. J. W. Adams is the sportsman of the firm, and will take special pains to please any of our friends calling upon him, or with any orders sent him. It is a good, reliable house.—*Adv.*

FOREST AND STREAM

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

Terms, Four Dollars a Year, Strictly in Advance.

Twenty-five per cent. off for Clubs of Three or more

Advertising Rates.

Inside pages, nonpareil type, 30 cents per line; outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

*** Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, APRIL 12, 1877.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

☞ Trade supplied by American News Company.

CHARLES HALLOCK,
Editor and Business Manager.

DON'T YOU FORGET IT.

—On the 1st of May next the office of FOREST AND STREAM will be removed back to its original quarters, 103 Fulton Street.

FISHING RIGHTS ON NON-TIDAL RIVERS.—In the Canadian Parliament this question is at present under discussion. The result will be looked for with general interest in that country and this. The question arose on the motion of Mr. Palmer for an order of the House for a return of leases of right to fish in the tidal waters of New Brunswick. He claimed that the proprietors of riparian rights had to be protected from any innovation, as it would tend to destroy or injure those rights. Whenever a person had a right of soil in a river where the tide does not flow, he had an exclusive right to that property just as if it were an ordinary piece of property. He held that the Dominion had no right to interfere with that right. He cited the act to prove that it was not contemplated to interfere with that right. He held, that if the power given to the Government did give them control over fish in sea and inland waters, still it did not give them any privileges of interfering with private rights. But it was not even clear to his mind that they had the power to deal with the fisheries of our tidal waters. He did not complain that any wrong had ensued, but he desired to have an important question settled.

Hon. Mr. Smith said he hoped that an action now pending in the courts would result in some decision being arrived at on the subject.

COACHING.—Colonel Delancey Kane commences his regular coaching season on the route between the city and Pelham on May 1st. The coach has been entirely refitted, and named the "Tally-Ho." The start will be as before, from the Brunswick, and the route will be the same as last year. Seats are now booked in advance for the whole of May. Saturday, May 26th, has been fixed for the annual parade of the Coaching Club.

QUERY FOR SCIENTISTS.—What is the difference between a manatee and men-at-ease?

—People intending going to the sea shore the coming season, or going shooting, should go to the Halsey House, advertised in another column, where they will be sure to find a good table, rooms that will suit the most fastidious, and first-class guests. Send to him for a circular. —*Adv.*

THOUGHTS ON EDUCATION.—IV.

AND now with regard to the physical part of the problem, and proceeding in the same way by adducing examples, is there no kind of a connection between the sound, healthy, eloquent productions of the pen of Kit North, and the strong physique and lion-like appearance of the Scotch professor? Wilson alternated his lectures on moral philosophy and his editorial labors on "Maga" with fishing and shooting excursions, and in his "Recreations" has given us some of the most joyous and healthful literature in the language. They are the work of a man full of exuberant life and infectious hilarity, who could play a salmon with the same skill with which he could enforce the principles of philosophy. We do not say that the same qualities are invariably associated. Mind sometimes fairly triumphs over its fleshly temple, as in the case of Hood, who could joke and exercise his wit when in sickness and pain, for the ruling passion is found strong even in death. But, by way of explanation, let us take the instances supplied by Keats and Henry Kirke White. It is said that Keats died of the *Quarterly*. To be lashed by a reviewer is sometimes a credit, sometimes a disgrace, according to the character of the castigator; to be killed by one is to demonstrate the possession of a morbid sensitiveness never allied with a healthy physique or moral force. It would be hard to find anything noble or elevating in the picture of a poet wriggling on the point of a pen; rather commend us to the sturdy manliness which led Byron to pour forth his famous satire in reply to the taunts in the "Edinburgh." "Poor Keats," is the usual pitying way in which we speak of the talented author of "Endymion," and "poor Keats" he will remain to the end of the chapter. His moral character or stamina must have been weak, but to let his life ooze out through the wound made by the deadliest goose quill ever wielded must further be held to bespeak a decided lack of the blood, bone, nerve, and sound digestion, which a more complete education would have given him. White, again, simply read himself to death. He, one of the most promising of England's *literati*, chose to neglect every rule for keeping body and soul together, and so they parted company, and all the labors of his maturity were lost to the world. There are men enough like him today, who will persist in attempting to solve the problem as to how a lamp can be kept burning without oil. We will merely hint at their folly in exaggerating the importance of brain over body, and state the fact that they are demonstrating the unsoundness of their education. We might put it in the light of a duty they owe themselves and the community to which they belong, to have some regard for their bodily health, but we prefer to lay the burden of duty upon their teachers, and thus we arrive at the true system of education.

In the first place, there are in some odd nooks and corners of this world institutions called "infant schools," every one of which ought summarily to be put down. They answer no purpose ever heard of under heaven, except to keep the children of the poor out of mischief while their mothers are at work; and that object is attained at what is surely a fearful expense, if the brains of the little ones are to be roused and stimulated to unnatural activity, and their limbs and health crippled. Why not call them nurseries, and not schools, if such be their use, and then the agonizing spectacle might consistently be abolished of seeing children struggling to emit sounds, to which they are incapable of attaching any sense, and to which their unruly—in the sense of being unformed or incapable—tongues refuse to give intelligible utterance?

To speak of the more general system now in force, a law should, if necessary, be passed to supply a legislative substitute for the common-sense lacking in the community, making ten or twelve the minimum age for admission as a scholar at any public school. The first objection to this mode of treating the case is, that the government is called upon to interfere arbitrarily in the affairs of citizens. But education has, in many places, been removed from the category of things to be left to private judgment and individual discretion. Compulsory education has its advocates everywhere, and there are many sound and just reasons why it should be made a subject for legislative supervision. If it can be justified in this respect, it becomes at once obvious that the lesser hardship of conforming to a prescribed method ought to be met by no demurrer. Ignorance has always been the first to raise a barrier to enlightenment. The people who have received no education cannot have any just conception of the benefits it confers; and in the same way, those who have suffered no evil consequences in their own persons, at least tangibly, from a certain system, are the last to recognize its prejudicial elements. In both sets of circumstances it is only reasonable that superior knowledge should have a directive power.

The main opposition, however, will be found to arise from the preconceived and erroneous notions entertained by most people of the means of acquiring education—to use a current but dubious phraseology—and of the possibilities involved in the problem the process presents. They argue, that if a youth requires a certain amount of intellectual capital, the sooner he is set about accumulating it and the harder he is pushed in piling it up, the sooner he will be ready for that work in the world in which it is be turned to account. Suppose, for a moment, we look at the parallel physical problem. You wish to make your son a bargee or a coal-heaver? Do you suppose that if you exercise his muscle sufficiently from infancy up, you can turn out a fully developed *man* at fourteen? One might as well suppose that, given a certain amount of food to carry a man through a year, he can eat it all in one month, and live on the fruits of his masticating and digesting industry during the other eleven, always supposing that he survives the month of feasting; and so the fact remains, that beyond a certain point intellectual cultivation cannot be forced. The brain should be led on to discharge its functions in the health and strength of a vigorous maturity, and when in early years nature's limit is passed, there is the immediate danger of an impending sudden collapse from the over tension, and the certainty of future but early and rapid decay. Too heavy a call upon the brain when it is weak may produce in response the deceptive flash of precocity, but in the after years no harvest is reaped corresponding with the early promise; the lamp sheds but a glimmering and sickly light when it should be burning at its brightest.

What could have been more pernicious and foolish than giving a public school-boy such a subject as "The Centennial Exposition—Its Influence on the Future of Our Country" to wrestle with, in order to gain a ten-dollar essay prize, or asking a school-girl's views in the form of an essay upon "The most Important Branch of Female Education?" We need not go into the side issues of teaching the young dishonesty, by compelling them for honor's sake to beg, borrow, and steal ideas and language, but let us look at the honest essayist without pity if we can. His subject is one that men with trained intellects and experience might cope with, but to the boy it offers nothing upon which either his reading or his experience enables him to seize. He tugs and strains at the tough problem, looks at it on every side and in every light conceivable to him, but it remains where it was at first—above his comprehension. Why not force him to break his back in attempting to turn over a house? The physical and intellectual tasks are exactly parallel.

We have already hinted at schools and teachers other than those practically recognized by the educational faculty of our day. In the tender years of childhood and early youth as much freedom from restraint as is consistent with the most liberal kind of discipline is the first requisite. Nature should be helped, not thwarted; and she, the mighty and prolific mother, should be the first teacher—the child's parents the next. The earliest educators, we repeat, should be nature and mothers; the first schools, the country and the nursery.

A GREAT WORK PROMISED.

AT last we are to have a complete and reliable *History of North American Mammals*, and that, too, a history which shall include not merely bare and dry scientific facts and details, but also the story of the lives and habits of the numerous and varied forms of mammalian life in which our country abounds, many of which, alas! are fast passing away for ever. In order to secure the greatest possible amount of information, and this from as many different localities as possible, Dr. Coues, who promises us this greatly needed work, has issued a circular addressed to the medical officers of the army, setting forth what is proposed for the work and what is desired of observers. This circular we append, in the belief that many of our readers may be able and willing to furnish matter of interest, which we feel sure will be gladly received and acknowledged. To speak of Dr. Coues' especial fitness for the labor he has undertaken is of course needless. Those who are familiar with his *Key to North American Birds*, his *Birds of the Northwest*, and the important chapter on mammals contributed by himself and Dr. Yarrow to the recently published volume on the Zoology of Lieut. Wheeler's Survey, will decide for themselves that the work could not have been entrusted to more competent hands. While Dr. Coues is nothing if not scientific, he possesses a grace and beauty of diction and a vein of poetic fervor, when treating of his favorite subjects, which will make the Life Histories of our Mammals delightful reading to every cultivated mind. The circular, which, by the way, is strongly indorsed by the Surgeon-General, is as follows:

OFFICE OF THE U. S. ZOOLOGICAL AND GEOGRAPHICAL SURVEY,
WASHINGTON, D. C., March 13, 1877.

To the Medical Officers of the Army.

Medical officers of the army and others who may be interested in the matter are respectfully and earnestly invited to co-operate with the undersigned in the preparation of a work entitled, "History of North American Mammals," to be published by the Government.

It is now twenty years since the last general work upon the quadrupeds of this country appeared. The progress of our knowledge during this period renders the demand for a new treatise imperative. It is proposed to make the forthcoming "History" a standard scientific treatise, covering the whole ground, and fully exhibiting the present state of our knowledge of the subject. The plan of the work may be briefly indicated; its scope includes:

1. The classification of North American Mammals according to the latest and most approved views of leading therologists, including diagnoses of the orders, families, genera, and species.

2. The most acceptable nomenclature of each species and variety, with extensive synonymy.

3. The elaborate technical description of each species and variety, including much anatomical detail, especially respecting the skull and teeth.

4. The geographical distribution of the species—an important matter, concerning which much remains to be learned.

5. The "life-histories" of the species, or an account, as full and complete as it can be made, of their *habits*. This is also a matter requiring much further study.

6. The bibliography of the subject.

While the strictly scientific character of the work will be maintained, the "life-histories," being of general interest, will be divested as far as possible of technicalities, and treated with a free hand, in popular style. The author has long been engaged in gathering material for this work, already far advanced, and hopes to publish at no distant day. His resources and facilities for the preparation of the descriptive and other technical portions of the treatise have been ample; but he has still, in common with other naturalists, much to learn respecting the geographical distribution and habits of North American Mammals. To these points, therefore, special attention is invited, with the expectation that much important and valuable information may be secured with the assistance of medical and other officers of the army, many of whom enjoy unusual facilities for acquiring a knowledge of this subject, and whose individual experiences in many cases represent a fund of information not yet on scientific record, but which, it is hoped, may now be made fully available.

The geographical distribution of animals can be thoroughly worked out only by means of observations made at very many different places. To this end it is desirable that lists should be prepared of the various species found in any given locality, noting their relative abundance or scarcity, times of appearance and disappearance, nature of their customary resorts, and other pertinent particulars. A sufficient number of such reports, from various stations, would greatly increase our knowledge, and render it more precise. It is believed that the "History of the Post," as already prepared by medical officers, usually includes information of this kind, which, by the permission of the Surgeon-General, is made available for the present purpose.

As a rule, the habits of *larger* "game" animals, such as are ordinarily objects of the chase for pleasure or profit, and of all those which sustain obvious economic relations with man, as furnishing food or furs, or as committing depredations upon crops or live stock, are the best known; yet there is much to be learned even respecting these. The habits of many of the *smaller*, insignificant, or obscure species are almost entirely unknown. Full and accurate information respecting the habits of the numerous species of hares, squirrels, shrews, moles, mice, rats, bats, weasels, gophers, etc., is particularly desired. The bats offer a peculiarly inviting and little explored field of research. Among points to which attention may be directed, in any case, are the following:

Date and duration of the rut. Period of gestation. Usual time of reproduction. Number of young produced. Duration of lactation. Care of the young, by one or both parents. State of monogamy or polygamy. Times of disappearance and reappearance of such animals as are migratory, and of such as are hybernate. Completeness or interruption of torpidity. Times of changing pelage, of acquiring, shedding, and renewing horns. Habits peculiar to the breeding and rutting seasons. Construction of nests, burrows, or other artificial retreats. Natural resorts at different seasons. Nature of food at various seasons; mode of procuring it; laying-up of supplies; quantity required. Various cries, of what indicative. Natural means of offense and defense, and how employed. General disposition, traits, characteristics. Methods of capturing or destroying, of taming or domesticating. Economic relations with man; how injurious or beneficial, to what extent, used for what purposes, yielding what products of value.

Other points will doubtless suggest themselves to the observer. Anatomical notes of careful dissections of soft parts, particularly of the digestive and reproductive organs, are valuable. Anecdotal records of personal experiences possess at least the interest which attaches to originality, and are very acceptable. Persons are frequently deterred from communicating their observations for fear that what they have to offer may not be wanted. This is generally a mistake. In the first place, duplication of data serves the important purpose of corroborating and confirming the accuracy of reports furnished, and in all cases of seasonal phenomena, which of course vary with latitude, the same observations may be profitably repeated at different stations. Secondly, persons who write books are generally supposed to know more than they really do.

Specimens of common and well-known animals, especially if bulky, are of course less desirable than those of rare and obscure species; but specimens of any species secured beyond the ordinary geographical range, or illustrating unusual conditions, such as albinism, melanism, or malformations, or representing certain stages of growth, are always in demand. Small, dry parcels may be conveniently mailed direct to the undersigned; large packages should be sent in accordance with Circular Orders, No. 2, War Department, Surgeon-General's Office, April 13, 1875, (copy herewith), or by express, if the Quartermaster's Department cannot furnish transportation. Specimens, after examination by the undersigned for the purposes of the work in hand, will be deposited in the name of the donor, in the Army Medical Museum, or in the National Museum.

Printed instructions for collecting and preserving specimens will be furnished on application to the undersigned, or to this Institution. Medical Officers receiving this circular are requested to bring it to the notice of others who may be interested in the matter, and are cordially invited to open correspondence with the writer upon the subject.

It is proper to add that, for all information or specimens furnished, full credit will be given in every instance, both in the text of the treatise in which such material is utilized, and in the records and publications of the Museum in which it is finally deposited, and that the author will regard co-operation in this work as a personal favor, to be fully appreciated and gratefully acknowledged.

ELLIOTT COUES,
Assistant-Surgeon U. S. Army.

GAME PROTECTION.

NEW YORK.—The annual meeting of the Onondaga County Sportsmen's Club, of Syracuse, was held at the club rooms in the Kimber Block last evening. The following officers were elected: President, Samuel W. Sherlock; 1st Vice-President, Thomas E. Townsend; 2d Vice-President, George Lodder; Secretary, John Stedman; Financial Secretary, Edward Lodder; Treasurer, Thomas Kimber, Jr.; Attorney, George W. Gray; Executive Committee, D. H. Bruce, F. E. Carroll, W. H. Larrabee.

The regular monthly meeting of the New York Association for the Protection of Game was held on Monday night at the residence of Mr. Clinton Gilbert, President of the Association, No. 20 West Tenth Street. Mr. Thomas N. Cuthbert, Secretary, read a large number of communications from correspondents in all parts of the State, the majority of which contained suggestions for the amendments to the game laws, which, however, had already been incorporated by the Committee on Game Laws into the bill now pending before the Legislature. Mr. Cuthbert also reported that the legislative committee had adopted the amendment of the association prohibiting the killing of deer on Long Island, and had gone further, in prohibiting the killing of deer in Suffolk County for an indefinite time.

Senator Wagstaff announced that the bill drafted by the association had, with a few amendments, which the association would approve of, been ordered to a third reading, and would probably become law in a day or two, a very friendly feeling being manifested toward it in the Assembly.

On motion of Senator Wagstaff, the President was authorized to appoint a committee of five to represent the association at the next Sportsmen's Convention in this State.

Mr. Charles E. Whitehead, counsel to the association, reported that with the recurrence of the 1st of March he had found the usual number of delinquents engaged in selling game contrary to law. This significant fact, however, was noticeable, that very few offenders were found among market men (who formerly were the most persistent violaters of the law), the majority of the delinquents being dealers on the remote avenues in the city, and nearly all were Germans. He had had the city patrolled by three detectives on the 1st of March, and as a result 21 complaints had been made. On these complaints he had brought 18 suits. Half those suits were met by a general denial, and the other half by letters begging for clemency, on the ground that the offenders had not violated the law intentionally, but through ignorance. He felt confident that a number of the offenders did not intend to violate the law, and thought the objects of the association would be fully carried out by withdrawing the suits against such offenders on the payment by them of costs. The only market men found violating the law were A. & D. Robbins, against whom he had brought suit. On motion, Mr. Whitehead was authorized to withdraw, at his discretion, suits against all such offenders as had violated the law inadvertently, on the payment of costs.

A communication was received from Dr. Torry, President of the Yonkers Game Association, requesting the club to take action for the protection of oysters in the Hudson River between Yonkers and New York. The Secretary was directed to correspond with Senator Robertson, who represents the district in question, on the subject.

Mr. H. N. Munn moved that the association print a sufficient number of copies of the Game Laws to be hung up in each of the post-offices in the State, so that the residents of each district would be kept informed of the dates of the opening and closing of the game season.

On motion of Mr. Robert B. Roosevelt, a committee of three was appointed to estimate the cost of printing, and report at next meeting.

The meeting then adjourned.

—The Adirondack Club has recently been incorporated. Its object is the protection of game and fish in the North Woods. The territory over which the club claims jurisdiction is in Essex County, and it consists of 95,000 acres. The tract is owned by the Adirondack Iron and Steel Company, and the club has taken a ten-years' lease on it. It is well supplied with small lakes and streams, and so fish, as well as furred and feathered game, are abundant. Already one of the lakes has been stocked with 20,000 of the young fry of the California and the land-locked salmon of Maine. James R. Thompson is the President of the club, Wm. E. Parsons the Treasurer, and Thomas J. Hall the Secretary. These officers, with Francis H. Weeks, W. H. Folsom, and W. H. Forsey, constitute the Executive Committee.

MASSACHUSETTS FISH AND GAME PROTECTIVE ASSOCIATION.—The first annual meeting of the Massachusetts Fish and Game Protective Association was held Friday evening, 9th inst., at the rooms of the Association in Boston. Dr. John P. Ordway presided, and after the reading of the records of the last meeting Hon. Charles Levi Woodbury was elected a life member of the Association and the names of the following gentlemen were proposed for annual membership: C. M. Clapp, Hon. William Aspinwall, and T. J. Dunbar.

The following gentlemen, whose names were proposed at the last meeting, were then elected to membership: John H. Blake, Donald Kennedy, Luther Adams, and George A. Bullens.

The acceptance of the act of the Legislature changing the name of the Anglers' Association to that of the Massachusetts Fish and Game Protective Association making certain changes in the by-laws necessary was considered, and Hon. Daniel Needham, Weston Lewis, H. H. Kimball, and Dr. John P. Ordway were appointed a committee to report such amendments as may be deemed necessary.

Charles Hallock, editor of the FOREST AND STREAM, was proposed for honorary membership, after which the following officers were elected for the ensuing year: President, Dr. John P. Ordway; Vice-Presidents, Hon. Thomas Talbot, Hon. Chas. Levi Woodbury, Hon. Daniel Needham, C. Warren Jordon, Charles Stanwood; Treasurer, Wm. F. Story; Recording Secretary, Henry H. Kimball; Librarian, James A. McKee; Executive Committee, James P. Richardson, Walter M. Brackett, James Walker, L. Prouty, Weston Lewis; Committee on Membership, D. T. Curtis, E. Delano, C. T. Jenkins.

Mr. Charles E. Pierce declining a re-election as Corresponding Secretary, a position which he has filled for the past three years; a resolution extending the thanks of the Association for his able and efficient services was adopted

The Secretary reported that there were 16 life, 66 honorary, and 440 annual members. During the past year 22 meetings have been held, 50 names proposed, 5 lectures delivered, and 5 deaths have taken place.

Mr. Neil of Winchester was invited to deliver a lecture before the Association on Wednesday evening, April 25th, to which time the meeting adjourned.

ILLINOIS.—Those interested in the protection of game in this State will be pleased to learn that the game bill has passed the Senate and become a law. The bill provides "That it shall be unlawful for any person or persons to hunt or pursue, kill or trap, net or ensnare, destroy, or attempt to kill, trap, net, ensnare, or otherwise destroy any prairie-hen or chicken, or any woodcock, between the fifteenth day of January and the first day of September in each and every year; or any deer, fawn, wild turkey, ruffed grouse or pheasant, between the first day of February and the first day of October in each and every year; or any quail between the first day of February and the first day of November in each and every year; or any wild goose, duck, snipe, brant, or other water-fowl, between the first day of May and the fifteenth day of August in each and every year. *Provided*, That it shall be unlawful for any person or persons to net any quail at any time after this act shall take effect and be in force; and, *provided further*, That it shall be unlawful for any person or persons, who is or are now residents of this State, to kill, ensnare, net, or trap any deer, fawn, wild turkey, prairie-hen, or chicken, ruffed grouse, quail, woodcock, wild goose, wild duck, or brant, or any snipe, in any county of this State, at any time, for the purpose of selling or marketing, or running the same outside of this State. Every person who violates any of the provisions of this section shall, for each and every offence, be deemed guilty of a misdemeanor, and on conviction shall be fined in any sum not less than five dollars ($5), nor more than twenty-five dollars ($25), and costs of suit for each and every separate bird or animal of the above enumerated list, so unlawfully hunted or pursued, killed, trapped, nested, ensnared, or destroyed, or attempted to be killed, trapped, ensnared, or otherwise destroyed, and shall stand committed to the county jail until each fine and costs are paid, but each imprisonment shall not exceed ten days. No person or persons shall sell, or expose for sale, or have any in his or their possession, for the purpose of selling or exposing for sale, any of the animals, wild fowls or birds, mentioned in section one of this act, after the expiration of five days next succeeding the first day of the period in which it shall be unlawful to kill, trap, or ensnare such animals, wild fowls, or birds. And any person so offending shall on conviction be fined and dealt with as specified in section one of this act.

A bill of the above nature was much needed in Illinois to stop the wholesale destruction of our native game.

Much good is expected from this judicious legislation.

ROVER.

MINNESOTA.—We are indebted to a correspondent at Hastings, Minnesota, for a copy of the game laws passed by the last Legislature of that State. The law is a very long one and filled with those double and twisted sentences in which some legislators delight, and without which they think a law is no law, but by means of which their meaning and intent is some times very much perfected. For instance, we find in section 4 that,

"Until after March 1st, 1880, no person shall sell or expose for sale, nor have in his possession or custody, or under his control, with intent to sell or dispose of, any woodcock, save only during the month of July, after the 31 day thereof and during the months of August, September, and October, nor any white-breasted or sharp-tailed grouse or prairie chicken, save only during the month of August, after the 14th day thereof, and during the month of September; nor any quail or partridge, save only during the months of September, October, and November; nor any ruffed grouse or pheasant, save only during the months of September, October, and November succeeding; nor any aquatic fowl, save only between the 1st day of September and 15th day of May succeeding; nor any elk, deer, buck, doe, or fawn, or piece, or green skin, or either or any of them, save only during the months of November and December, and up to and including the 14th day thereof; nor any speckled, river, or brook-trout, save only during the months of April, May, June, July, August, and September, in any year."

There are twenty-one sections in all in the act, the others referring to penalties, trespass, etc., but the above contains the close seasons.

—"Guyon" drops us a line from Corinth, Miss., in this wise, style characteristic.

"Some thick-skulled legislators have so altered the game laws that the close season for turkeys commences the first of March. This cuts off our spring hunting for goblers, unless we go over and invade Guido's territory. But they have a game law over there, in some parts of the State. But you don't claim McNairy, eh Guido?

"We will drive our gobblers 'o'er the borders' and then bag them. Snipes have been scarce and fearfully wild; have only bagged a few. Tried a bittern cooked after Frank Forester's style the other day. Now, with all due deference to Forester or any other man who likes bitterns, I will say as did the man when asked to eat *crow*, 'I *can* eat crow, but don't *hanker* arter it.'

'It is my private opinion that they, the bitterns eat tadpoles and *smirk* too; any way I tried the aforesaid, one with a 'squeeze of lemon, and a dash cayenne,' and I am bound to admit I had more trouble in 'worrying it down' than the old woman did the rye after it was made into whiskey. I am not *open* for any more engagements with broiled bitterns."

GUYON.

CANADA.—The correspondent whose letter we print below writes to us from the Megantic District under date of March 29th. His information is undoubtedly correct, and will be received by Canadian sportsmen, as well as by many in this country, with deep regret. It seems incredible that one class of the population should be exempt from the operation of laws made for the benefit of all, and we have no doubt but that his timely protest will have the effect of remedying the evil. His name is a familiar one to our readers, and we can endorse his statements as being worthy of full credence.

EDITOR FOREST AND STREAM:

Large numbers of deer have been slaughtered in this district since the close season, began February 1st. On the first Sunday of that month in one locality alone twelve deer were run down in the deep snow and knocked in the head. The most of the work has been done by the French settlers, who have lately come into this country, and there have not been any efforts made as to yet put a stop to this work, for the officers whose duties are to put the game laws in operation against these offenders have received instructions from Mr. Garneau, the Crown Lands Commissioner in Quebec, ordering them not to prosecute any French settler who may be found killing deer or moose out of season, and also to refrain from taking action against them for any other violation of the game laws without first reporting the case to him in each individual instance. Which are we to obey—the laws of the land, or Mr. Garneau? "Do we live under a despotism? that a petty official should have the power to say who should, or who should not, be prosecuted for violation of the law?" If so, it's high time that every sober-minded voter should see that there be a change of those now in power. As it is, there will be magistrates found who will not shirk their duties, and will switch to the full extent of the law every person who may be brought before them and convicted with violating the game laws. It was a great piece of folly that made our present Government offer such great inducements as they did to the Frenchmen to return from the States and settle here. The most of the land is old and stony, not suitable for agriculture. In a few years times will have improved in the United States, and these Frenchmen will have sucked the government pap dry by that time. Then they will abandon their lands here and return from whence they came; but in the meantime they will have destroyed the best timber in our forests, the moose and the deer, and have cleaned the trout out of the streams and lakes with their nets, spears, and lights, leaving this once beautiful district looking as if a curse had fallen upon it, a fit emblem of the policy adopted by Mons. Garneau and his associates to aid their brethren at the expense of our public.

STANSTEAD.

TORONTO, Canada, March 10, 1877.

EDITOR FOREST AND STREAM.

As I know you take a deep interest in the matter of game protection I write to you regarding a notice I have just seen of a new game bill on your side of the line. Some one has sent me a slip from a Detroit paper of the 27th February, which describes Senator Burleigh's new game bill. Has this bill become a law or is it only a proposal? I think the bill is a very good one in many respects, but why only three kinds of duck to be protected? Wood duck, teal, and mallards only are mentioned; surely it is not intended that other ducks may be shot or killed at any season. We, in Canada, have a law which allows certain ducks, which are supposed not to breed in the country, to be shot in the spring, whilst those breeding here are protected. The consequence is that all ducks are shot, and we find it almost impossible to punish those who kill protected ducks, as they make the excuse that they cannot always tell one duck from another, and this excuse is generally accepted by the magistrate. If your law is not yet in force, I hope you will endeavor to have all ducks and water-fowl protected.

We tried this year to have our game laws amended by abolishing spring shooting and lengthening the close season for woodcock and snipe, but without success. I send you a copy of our proposed bill and think that we shall be able to carry it next year without doubt.

Yours very truly, T. HERBERT MARSH.
Sec. and Treasurer Ontario Fish and Game Protective Association.

THE FISH TRADE OF CANADA.—The opening of the Intercolonial Railway has certainly opened a new era for the fisheries of the Gulf of the St. Lawrence, and will cause considerable attention to be devoted to them. Hitherto, in good seasons, it has proved almost impossible to find a suitable market for fresh fish, which could not be preserved till conveyed very far inland by water. Now, however, it is asserted that fresh fish may be taken even in the heat of summer, in special cars prepared for its reception by the Intercolonial Railway, all the way from Halifax to Chicago. We observe from our exchanges that the people of the Lower Provinces fare fully aware of the increased importance of the fisheries, land in Halifax a new company has been formed to purchase and own fishing vessels and sell the fish fresh. It is called the "Nova Scotia Fishing Co.," and has a capital stock of $300,000. Its prospectus declares that it expects profits sufficient to pay a dividend of thirty per cent. upon paid-up stock, but like a great many other assertions, this is probably a very extravagant one.—*Quebec Budget.*

CANADA.—The London District Fish, Game, and Insectivorous Birds Protective Society had its annual meeting last month. The report of the secretary showed that much good had been accomplished through the efforts of the society, not only in preventing illegal hunting and fishing in their own vicinity, but by bringing about the formation of other similar societies throughout the Dominion. The following officers were elected to serve during the ensuing year: President, Dr. W. Woodruff; First Vice-President, Col. J. Walker; Second Vice-President, Dr. J. S. Niven; Secretary, Mr. B. C. Marshall; Treasurer, Mr. Jas. A. Mahon; Executive Committee, Messrs. W. C. L. Gill, W. Hudson, F. A. Despard, Charles Murray, A. Smith, T. H. Smallman, and Harry Bruce.

Sporting Notes from Abroad.

LONDON, March 26th.

Our se the one absorbing topic of the day, not only in sporting but in social circles, is the great race rowed on the Thames on Saturday between Oxford and Cambridge Universities. The cable will have informed you so thoroughly as to the result and particulars, that it would be supererogatory for me to go into them. Suffice it to say, that it was the closest and most exciting race ever rowed in these waters. There were all the usual scenes attendant upon this aquatic Derby; the crowds on the river bank and bridges, half-swamped barges, and pretty girls wearing either light or dark blue, as their inclinations or affections tended. The result you know; the two eight-oared shells starting simultaneously, with Oxford soon leading a trifle; then both boats alternately leading until Hammersmith Bridge was reached and Mr. Cowles, the Oxford bow oar, caught that unlucky crab which broke his rowlock or his oar, nobody seems to know which; and although the news that Oxford had won was first telegraphed through the city, it soon become known that the umpire's decision was "a dead heat." Many Americans witnessed the race, but I missed the face of Mr. George Wilkes, *The Spirit of the Times*, who has been present at so many of these events. The American sporting press, however, was worthily represented by Mr. James Watson, erstwhile of your city.

Those of your readers who read also the London *Field* must have been very much pleased at seeing the first of the new series of articles on dogs by "Stonehenge" (Mr. Walsh, editor of the *Field*). They promise to be most interesting and valuable. A correspondent over the signature of "Setter" took occasion to write a long letter in reply to the first article treating of that breed, in which he "pitched into" Mr. Laverack rather severely, and not only underestimated the qualities of that strain, but questioned their being bred as claimed. Of course every one saw at a glance that the letter was written either by Mr. Llewellin, or his henchman, Mr. Buckle, and in a foot-note to the letter the editor rather demolished it, and alluded to the fact, that if it had not been written so palpably in the interests of "Self & Co." it would be worthy of more consideration. This, of course, enraged "Setter," and in another letter he claims that the editor of the *Field* in alluding to him as "Self & Co." was "giving him away" as you say. And now comes Mr. Macdona in a splendid letter and completely demolishes Mr. "Setter," or Self & Co," proving his aspersion on the Laverack strain to be as unfounded as were some of the merits and performances claimed for the Duke-Rhœbe strain. Mr. Macdona makes and proves the assertion that for the last six years there have been no good setters running at field trials (except his Irish setters Plunket and Music) without possessing Laverack blood. He goes on to say:

"I frankly give Mr. Laverack's famous sort a share of the credit in the merit possessed by champion Ranger, his sire, Quince II., being more than half Laverack; Rob Roy was half Laverack, as his sire, was Laverack's Blue Dash; Countess was pure Laverack; Nellie, pure Laverack; Rum, winner in the braces in Devon, pure Laverack; Ryhl, by champion Ranger, half Laverack; Mr. Barclay Field's Rose and Rake, half Laverack; Daisy, half Laverack; Queenie, half Laverack; Countess Bear, half Laverack; Leda, half Laverack; Ginx, one-fourth Laverack; Rhoda, ditto; Dash II., three-parts Laverack; Sam, quite half Laverack, being by Serjeant out of Kate, and his sons, Young Sam and Dan, consequently inheriting Laverack blood. Here are all the winners since 1871, excepting Judith, who has recently proved that she crossed quite as well with the Laverack as the Rhœbe strain."

This discussion is interesting to Americans from the fact, that many of the noted dogs mentioned, or their progeny, have gone to your side, including the famous Plunket, but it looks as though the wordy warfare of three or four years ago was to be gone over again.

In a brief resume with which "Stonehenge" prefaces his present series of papers, he notices the fact that a great fluctuation has occurred among dogs used with the gun, the retriever proper having almost displaced the pointer and setter in the South. Fully 90 per cent. of the partridges are now shot either by walking them up when driven into turnips, or by waiting for them to be driven over the sportsmen concealed behind a hedge or wall. In both cases each gun (or rather leash of guns, for the crack sportsman now requires at least a pair, and often has three, with one or two loaders) is attended by a retriever. I look upon men who are willing to kill their birds in this manner as degenerate sportsmen, and hold that half the pleasure of shooting is in seeing the dogs at work. I know that in *our* country such sport would be called pot hunting. Sitting behind a hedge and waiting for partridges to be driven up to you must be pretty tame sport. Why not get down on all fours and *stalk* them in the turnips. "Stonehenge" does not think very highly of the dachshund, claiming that it is not the equal of the beagle or spaniel in nose, and inferior to the terrier in pluck. A single fox-terrier has been sold for £250, which is cited as an instance of unaccountability of taste in dog fanciers. As regards the relative merits of setters and pointers in the field, "Stonehenge" is of the opinion that little has been done to settle the question, although after a careful analysis of field trials it would appear that the balance is slightly in favor of the setter, and as this breed is, on account of their feet standing the heather best, now used almost entirely on the moors, the only place where dogs (except retrievers) are much used at all, it is probable that they will become the favorite dogs with the public. In non-sporting dogs the St. Bernard and mastiff are the fashionable breeds in the large classes, while for real utility the colley appears to be the coming dog. Altogether these papers promise to be most interesting.

I observe in this week's issue of *Land and Water* that Mr. Frank Buckland has received a box of salmon ova, containing 5,000 or more, from the Dominion Fish-Breeding Establishment at Newcastle. They were sent over by that eminent pisiculturist and genial gentleman, Mr. Wilmot, who has done so much for fish culture in Canada. The eggs were taken to Mr. Buckland's museum where they began to hatch out immediately. But the strange part of it is that these are the first American salmon that have ever been living in England. It seems strange that while such distant parts as New Zealand has had her virgin waters stocked with American fish, that the mother country should have never attempted such a cheap and convenient method of re-stocking some of her own depleted waters.

Although Monaco has been looked upon as the headquarters of Continental pigeon shooting, the large matches are not all confined to that favored spot. Near Florence, in Italy, is San Donato, where Prince Demidoff has an estate. This gentleman is an enthusiast on the subject of shooting, and has had erected a stand which has no equal in the world, and where he distributes valuable prizes to be shot for by his friends. Recently a meeting was held at his place which was attended by many persons of distinction from Rome, Genoa, and Naples. The prizes presented by Prince Demidoff were of remarkable value and beauty, one of the cups being worth a thousand dollars. But the interesting part of the programme to me was the fact, that one of the prizes was a magnificent double breech loader made by Purdey, of London, and the identical gun that was so much admired at the Centennial Exhibition.

The O'Leary-Weston six days walking match is now a fixed fact for the first week in April; *on dit* that O'Leary threw both of his matches with Howe and Corseland, and is likely to win this one, although as Weston is backed by Sir John Astley and a strong party, the money is going freely the other way—"*Quien Sabe.*" VAQUERO.

Rifle.

THE CAUSES OF RECOIL.

PREVIOUS to the introduction of the patent breeches and percussion locks, when the flint-locks were in general use, the universal supposition was, in regard to a gun kicking, "that the powder while burning *behind* the point of ignition exerted the backward motion to the gun." As the recoil continued to exist with the improved firearms, this theory was exploded and many others took its place; among them was the following:

"The phenomena is caused by the sudden return of air to the vacuum in the barrel resulting from the explosion of the powder." This idea of the subject is favored by many riflemen, who do not stop to reason a little before jumping at the conclusion that such is the case. In the first place, it is not possible for the air to return or rebound into the barrel of the gun with such an immense force, and if it did, the smoke after the explosion would not be seen, as it is, gradually escaping from the muzzle.

At the present time the general belief among riflemen appears to be, that the force of the recoil is in proportion to the amount of resistance given to the "pent-up power" by the projectile with its inertia, the friction caused by going through the barrel, and the pressure of the atmosphere against it before leaving the gun. The explosion of the powder when driving the bullet out of the barrel communicates to the arm itself a motion which is not perceptible until the projectile has left the gun, when the confinement of the pent-up force is suddenly relieved, and on that instant the recoil is felt in the opposite direction to where the force is escaping."

The effect of this instantaneous "give way" can be practically demonstrated by the following experiment: Let two people (gun and bullet) each take one of the ends of a rope (barrel of the gun which is to contain the 'pent-up force'); now tell each to pull their ends in opposite directions with all their strength (the pent-up force); without a warning suddenly cut the rope (the bullet leaving the gun); the resistance being gone the result can be easily imagined. The bullet leaves the muzzle bearing in the line of fire, and the recoil takes place in an exactly opposite course, just as the two persons are liable to fall in reverse directions when the rope is cut.

Only a portion of the recoil is felt on account of the stock of the gun being bent to enable the eye to glance along the barrel, which decomposes the force in two parts, one acting in the direction of the axis, and the other through the stock against the shoulder.

As the point of resistance (the shoulder) is beneath the line of recoil, the explosion has a tendency to throw the muzzle up and send the bullet high. Hence, the lower the point of resistance, the higher the forward end of the barrel will be liable to fly.

A shooter cannot get a definite idea of the force with which his gun comes back if standing "clear" from everything while shooting, as there is a certain "give way" to his body. By bracing his back against any stationary object and discharging the piece from the shoulder he will discover, to his sorrow, the whole force of the recoil, as was the case a short time ago with a long-range marksman, who was not very well acquainted with the mulish propensities of his rifle. He tried the experiment of lying on the ground with the butt of his weapon to his shoulder and fired heavenward, to see what effect it would have, for the fun of the thing. His doctor had a patient with a broken collar-bone. As there was no give to the earth something else was obliged to accommodate the pressing demands of the "critter," and the experimentist recoils from further investigations in rifle shooting. The doctor's bill, however, caused a "kick" of another kind.

It is said, on good authority, that the recoil of an American long-range breech-loading rifle, similar to the ones used by our team last year, is about one hundred pounds. W. W. Greener's book on "modern breech-loaders" contains a list, with the amount of the ascertained recoil of a number of English military rifles, which may be interesting. It is as follows:

"1856 pattern rifle, service ammunition, 47½ lbs.; long Enfield Sneider, Boxer ammunition, 47 ¼ lbs.; Whitworth, hexagonal, 530 gr. bullet, 85 grs. powder, 54⅛ lbs.; Whitworth, cylinder, 530 gr. bullet, 70 gr. powder, 47½ lbs.; Westley-Richards, cavalry, breech-loader, 43⅜ lbs.; cavalry carbine, 577-bore, 43½ lbs.; cavalry carbine, with two drachms of powder and 480 gr. bullet, 39 lbs."

A gun in a machine-rest will shoot a certain distance with lower elevations than it would if fired off hand. This fact has been proven, and the difference with a Springfield musket has been found to be about eight inches in a hundred yards.

The same deflection will be found more or less with all guns under similar conditions. The cause is supposed to be due to the diminished recoil of the piece arising from the weight of the machine attached to it, causing the force, which would have been used in pushing the gun backward to be expended as extra power, in the expulsion of the projectile. In the same way, by pressing the piece firmly against the shoulder the "kick" is lessened and, theoretically, the range is increased.

The old saying—"Every rosebush has its thorns"—can be applied with an appropriate meaning to shooting, the "kick" being a thorn to the shooter's rosebush. ONICKO.

THE SWISS MATCH.—The following are the scores made in the recent match between the Zettler Rifle Team and the Columbia Rifle Team, shot with Swiss rifles, 200 yards range, at ring target; 15 men in each team; 10 shots each; possible score, 250.

ZETTLER TEAM.		COLUMBIA TEAM.	
Name.	Total.	Name.	Total.
William Kline	203	Lamtold	205
G. G. Lettler	202	J. Fiedner	197
T. Fenning	200	J. Rein	196
Theodore Kliesroth	200	J. Horney	194
L. Bird	187	W. Lippman	183
M. L. Riggs	186	M. Archbach	181
D. Miller	184	Aug. Ermuch	181
C. Judson	183	J. Heinz	180
M. Engel	182	G. Blumenberg	180
M. Dorsler	180	G. Kendall	177
B. Zettler	174	John Bandel	171
B. S. Brown	174	Chris Heinz	168
J. Datel	166	J. Schneider	161
D. L. Beck	161	George Baier	145
G. A. Schurman	130	J. Gruber	120
Grand total	2,712	Grand Total	2,647

The Zettler team winning by 65 points.

CONLIN'S BENEFIT.—Since our report last week this match has received additional prizes as follows: An elegant Japanese cabinet, presented by the Zettler Rifle Association; two fine opera glasses, presented by the Arnold & Constable Rifle Club; one fine trout rod, presented by Mr. H. D. Blydenburgh.

The targets shot in this match are placed in a sealed box, can only be measured at the close of the competition by three judges, to be appointed by the Committee of Arrangements. There are several gentleman whose targets are so near alike that it has caused a great deal of excitement to know which is ahead. The large number of prizes offered insures a premium to every competitor of average skill. It speaks well for "Conlin's" popularity that the prizes in this match have a total value of more than $250, and that all of them have been given by his friends and patrons. It is desired that these riflemen who are unable to take an active parr in the contest will lend their aid by subscribing for tickets according to their means. Such subscriptions may be sent to the Committee, P. O. Box, 5529, or to the Zettler Rifle Gallery, 207 Bowery, where the match is being held.

—The Council of the Ontario Rifle Association has under consideration the question of replacing the iron targets at present in use by canvas ones, but inasmuch as it is yet an open question which system of targets is likely to give the greatest satisfaction, they are unable to make a recommendation of any definite change at present.

—Adj.-General Franklin Townsend, has issued a circular letter to the Adjutant General of the several States calling their attention to the bronze trophy, "Soldier of Marathon," given by the State of New York, to be annually contested for in an Inter-State Rifle Match, at each fall meeting of the National Rifle Association at Creedmoor. He invites a team of twelve men from each State to contest for the trophy in a match to be shot in September next.

CONLIN'S GALLERY.—We are glad to announce that Mr. Conlin will open his new shooting gallery at 1222 Broadway tonight. The new quarters are more commodious than those recently burned, and a club room has been provided that will be placed at the disposal of the various rifle clubs in the city. We wish Mr. Conlin every success in his enterprise.

MILEY'S GALLERIES (Brooklyn).—The following is a record of last week, and up to Tuesday morning:

E. B. Castner	5 5 5 5 5 5 5 5 4 5—49
W. H. Dougherty	5 5 5 5 5 5 5 5 4 5—49
A. L. Swan	5 5 5 3 5 5 5 5 5 4—47
A. H. Dougherty, Jr.	5 5 4 5 5 5 4 5 5 3—46
F. P. Pike	5 5 3 4 5 5 5 5 5 3—45
A. H. Anderson	5 5 3 5 5 5 5 4 5 3—45
D. T. McQuillan	5 5 5 5 3 4 5 4 5 3—44
W. H. Lilliston	5 5 5 5 4 4 4 3 4 5—44

The above is made in lying down position, distance, 120 feet, at reduced target. In the press match, the Brooklyn *Union* team is ahead. Both matches will end on the 14th and 15th of this month.

SAN FRANCISCO—*California, March 26th.*—The following is a score made by Sergeant G. V. Hawes, at the Forest Gallery, at 200 yards, target reduced, distance 175 feet; the gentleman winning the first prize, a handsome gold badge, the badge to be shot for once a week for fifteen weeks.

4	4	4	4	5	4	5	5	4	4	43.	5	4	5	4	5	4	4	4	5	4	41

Total 667

Out of a 750 off-hand, 200 yards, 6 pounds pull.

OSCAR SPITZER.

—The Santa Anna, California, *News* is responsible for the tough story, that a shower of clams in the shell fell on Dr. Jones' ranch, near that place, during a recent rain. The lady of the household occupying the ranch gathered up a quantity of the clams, they being alive, and cooked them for her family.

CONSUMPTION CURED.—An old physician retired from active practice, having had placed in his hands by an East Indian missionary the formula of a simple vegetable remedy for the speedy and permanent cure for Consumption, Bronchitis, Catarrh, Asthma, and all Throat and Lung affections, also a positive and radical cure for Nervous Debility and all nervous complaints, after having thoroughly tested its wonderful curative powers in thousands of cases, feels it his duty to make it known to his suffering fellows. Actuated by this motive, and a conscientious desire to relieve human suffering, he will send, free of charge, to all who desire it, this recipe, with full directions for preparing and successfully using. Sent by return mail by addressing with stamp, naming this paper, Dr. J. C. STONE, 52 North Fifth Street, Philadelphia, Pa.—4dv.

BLACK POINTER, TOM II.

THE NEW YORK BENCH SHOW.

WE are somewhat surprised to learn that an opinion was prevalent, particularly throughout the western part of the State, that the proprietors of Gilmore's Garden were interested in the coming Bench Show. We are requested to state that the Wesminster Kennel Club have leased for a large sum of money the Garden, or Hippodrome as it is sometimes known, from its proprietors, and that the latter are in no degree whatever interested in or connected with the show. The members of the club have assumed the entire risk and responsibility, and as their expenses will approximate the sum of *eight thousand dollars*, it is hoped that owners and breeders will enter liberally for the many prizes.

We congratulate the sportsmen of the country upon the fact that so eminent an authority as the Rev. J. Cumming Macdona has consented to visit this country and act as advisory judge, although for evident reasons Mr. Macdona's functions will not extend to the setter classes. In aiding us to establish a standard for many classes such as St. Bernards, mastiffs, etc., with which his name is so intimately associated, his visit will be of immense benefit, and his kindness in coming and the enterprise of the club in sending for him should be fully appreciated, and although, as we have said, he will not take part in judging the setter classes, the instruction he will doubtless be willing to impart in this direction will be of immense value to the student in canine matters. Mr. Macdona's letter of acceptance is as follows:

CHENDALE RECTORY, Cheshire, England,
March 23d, 1877.

My Dear Sir: I thank you, and through you, the Westminister Club, for your generous invitation to visit you next May, and am most happy to accept it. I should like to go out and back in a month.

I am, my dear sir, yours truly,
J. CUMMING MACDONA.

WM. M. TILESTON, ESQ.

As far as the judging is arranged for at present, it seems that Mr. John Davidson, of Munroe, Michigan, will judge the English and Gordon setter classes. It is possible that Mr. Macdona will be invited to take the pointers if the Committee do not feel that they are asking too much of him. Mr. Macdona will also judge the fox terriers, greyhounds, stag-hounds, deer-hounds, mastiffs, St. Bernard's, etc. Mr. Kavanah, of the Junior Carlton Club, London, who is very opportunely in the city, and who is a gentleman of very large experience in this direction, will judge the terrier classes. Capt. John M. Taylor, of Virginia, will judge Classes 28, 29, 30, 31, and from 41 to 45. Several gentlemen are under consideration for the very important fox-hound, beagle and harrier classes, as it is necessary that they should be judged according to the American standard, and by some one who is thoroughly conversant with the description of dog required in this country. The number of entries promises to be very large; already the third thousand of the premium lists is being distributed. The special prize lists is remarkably valuable and well arranged. Messrs. Tiffany & Co., of Union Square, are making six cups of solid silver, and have very generously gone to an expense far beyond the value of the cups in procuring moulds from life of celebrated dogs with which to ornament them. One very interesting feature will be a picture gallery, composed entirely of paintings of dogs and sporting scenes. The ladies and children will be provided for, as there will be an exhibition of trick dogs every afternoon and evening, some of the best troupes in the country having been engaged.

Below is an abstract of the Special prize list:

SUPPLEMENTARY PREMIUM LIST.

CLASS 9 A.—Native black and tan, or black, tan and white setters, either Gordons or cross-bred with Irish or English.—For the best dog, $50.00; for the best bitch, $30.00.

SPECIAL PRIZE LIST.

For the best setter, of any breed, dog or bitch, in the show, cup, presented and manufactured by Messrs. Tiffany & Co., value $150.00.

For the best pointer, of any weight, dog or bitch, in the show, Greener gun, presented by H. C. Squires, No. 1 Courtland Street, New York, value $150.00.

For the best brace of setters, of any breed, dogs or bitches, or dog and bitch; to be owned and exhibited by one person; cup, presented by members of the N. Y. City Association for the Protection of Game, and manufactured by Messrs. Tiffany & Co., value $150.00

For the best brace of pointers, dogs or bitches, or dog and bitch; to be owned and exhibited by one person; an extra fine fly-rod, presented by Frederick Schuchardt, Esq., value $50.00.

For the best collection of sporting dogs, of any kind, not less than five, to be exhibited, and owned by one person, or from one kennel; shot-gun, presented by Messrs. Nichols & Lefever, value $150.00.

For the best English setter stud dog, either native or imported, to be shown with not less than two of his get, a Fox patent shot-gun, presented by the American Arms Co., value $100.00.

For the best red Irish setter stud dog, either native or imported, to be shown with not less than two of his get; cup, presented by FOREST AND STREAM Publishing Co., and manufactured by Messrs. Tiffany & Co., value $100.00.

For the best black and tan, or black tan and white setter stud dog, either native or imported, to be shown with not less than two of his get; a Newport bass rod and reel, presented by Messrs. J. B. Crook & Co., value $75.00.

For the best pointer stud dog, over 50 pounds weight, either native or imported, to be shown with not less than two of his get; a shot gun, presented by Messrs. Remington & Sons, N. Y., value $100.00.

For the best pointer stud dog, under 50 pounds weight, either native or imported, to be shown with not less than two of his get; a set (3) of the new patent traps and 500 glass balls, presented by Capt. A. H. Bogardus, value $50.00.

For the best English setter brood bitch, either native or imported, to be shown with not less than two of her progeny; an English sole-leather sportsman's traveling trunk, with cartridge and gun trays complete, presented by Messrs. Thomson & Son, value $50.00.

For the best red Irish setter brood bitch, either native or imported, to be shown with not less than two of her progeny; a Russia leather, silver mounted fly-book and one gross assorted flies, presented by Wakeman Holberton, Esq., value $50.00.

For the best black and tan, or black tan and white setter brood bitch; either native or imported, to be shown with not less than two of her progeny; a silver mounted split bamboo fly-rod, presented by Messrs. Conroy, Bissett & Mallison, value $50.00.

For the best pointer brood bitch, of any weight, to be shown with not less than two of her get; a silver cup, presented by Col. Le Grand B. Cannon, and manufactured by Messrs. Tiffany & Co., value $50.00.

For the best English setter, dog or bitch, native bred, out of a native bitch and by an imported dog; a silver cup, presented by Dudley Olcott, Esq., of Albany, and manufactured by Tiffany & Co., value $100.00

For the best native English setter, dog or bitch, owned in the States of New York and New Jersey; a case of stuffed North-American game birds, presented by Justus Van Lengerke, Esq., value $25.00.

For the best setter, dog or bitch, of any strain, bred in the United States; a split bamboo black bass Rod, presented by Messrs. Abbey & Imbrie, No. 48 Maiden Lane, value $60.00.

For the best native setter puppy, either dog or bitch, either English, Irish, or black and tan, or black tan and white; a United States Arms Co., 32-cal. revolver, presented by Messrs. Barton & Co., value $25.00.

For the best Irish setter puppy, either dog or bitch; an ivory enameled opera glass, presented by Messrs T. Steele & Son, Hartford, Conn., value $25.00.

For the best pointer puppy, either dog or bitch; a gold and silver mounted pearl handled revolver, presented by the Westminster Kennel Club, value $25.00.

For the best native English setter puppy, dog or bitch, under 12 months of age; one case of gun-cleaning implements, presented by the Gun Implement Manufactory.

For the best display of fox-hounds, to comprise not less than three couples; a cup presented by the Westminster Kennel Club, value $50.00.

For the best cocker spaniel, dog or bitch; an English sole-leather gun case, presented by Erdmann A. Herzberg, Esq., value $25.00.

For the best skye terrier, dog or bitch; a silver cup, presented by Gen. Alex. S. Webb, and manufactured by Messrs. Tiffany & Co., value $50.00.

Owners of dogs winning cash prizes can have cups or collars of equal value substituted if they so desire.

The entrance fee for special prizes (for which separate entries must be made) will be $3.00 as in the general classes.

In the classes for stock dogs and brood bitches, it is understood that the progeny to be entered with them need not be the property of the person making the entry.

In order that the catalogue may be prepared at the earliest possible moment it is particularly requested that exhibitors will not delay sending in their entries. No entries will be received later than April 25th, except in the case of foreign exhibitors, whose entries will be received until May 1st.

Season tickets to exhibitors, admitting them to the building at all hours, will be issued at $5.00 each; season tickets to non-exhibitors, good only from 10 A. M. to 10 P. M., will be issued at $2.00. General admittance 50 cents.

Since the above was put in type another letter has been received from Mr. Macdona, giving the date of his departure, and saying that Mr. Lort, the celebrated judge, and also Mr. G. de Landre Macdona would be of the party, so that there is likely to be no lack of judges, and we can have our native classes judged most impartially. A line should have been printed in the premium list at the head of the open classes, stating that they are "for dogs who have never won first prize at any bench show." We make this remark, because gentlemen are sending in their entries, placing their prize winning dogs in both champion and open classes. It was to be presumed, however, that if a champion class was made with $50 prizes, from which other dogs were excluded, that the champions would of course not be allowed to compete in the open classes. The object of having special classes is, that all may come together. More special premiums have been offered, a silver collar for Scotch terriers, one for pugs, also an order for a silver cup of the value of ten guineas, from "Spratt's Patent," of London, through their agent, Mr. de Luze, of this city; also C. L. Retzman, 960 Broadway, presents a gold and silver mounted revolver for the best Gordon setter puppy, dog or bitch.

TOM.—Our portrait this week is a good likeness of Mr. Frederick Schuchardt's fine old pointer dog, Tom II. Tom is now eleven years old, having been whelped in 1866. He is descended from a bitch imported by Mr. Schuchardt in 1842, and is brother to Mr. Joseph Grafton's Jim and to Gen'l. A. S. Webb's Peg, grand dame of the Westminster Kennel Clubs Whisky. Tom, in his day, was a most excellent field dog, docile and active, with keen nose and staunch to bird and gun. He is entered in the champion pointer class at the forthcoming New York Bench Show.

TO OUR CORRESPONDENTS.—The number of queries sent to us and the requests for prescriptions are increasing so fast that we must request our correspondents, in order to enable us to give them advice which shall be of value, to be most particular in sending information on the following points. It is difficult enough in any case to prescribe without seeing a patient, but with the paucity of symptoms and particulars which accompany the majority of cases, it is well nigh impossible. We shall feel obliged, therefore, if applicants will in all cases state how long the dog has been sick, how taken, and the symptoms; whether in good flesh or poor; state of appetite; state of bowels; whether playful or otherwise; age, weight (about); what medicines if any have been given, and how often, and when the last was given; whether he has fever or not, and what part of the day he coughs most, if at all. Be as concise as possible.

DOGS IN A WILD STATE.—A Michigan correspondent sends us the following account of a dog reverting to a wild state. Writing from Pontiac, Mich., he says:

The State of Michigan is building an Insane Asylum near here, and one of the workmen recently started a rabbit which ran into a rail pile. He went to try and get it when he saw a pair of eyes sparkling beneath the rails. He shot at the eyes, and when he got what he shot at behold it was a little puppy not much bigger than his fist. On removing the rails he found a woodchuck hole, and, as it afterward proved, a little bitch had whelped and raised a litter of young ones in this hole. A couple of weeks after the event recorded above the workmen noticed a dog with a litter of puppies coming round the works, picking up scraps of food which had been thrown away. They tried to catch them, but on the approach of any one the dogs would scamper off, and on being watched they were found to retreat to the woodchuck hole. They finally managed to capture two of the pups, but they were as savage as any wild animal, and would bite and fight like young tigers, though they were not much larger than rats at the time. I saw one of them a few days ago; it is full grown and does not look very much unlike in shape the picture of the German daschund which you published some time ago. He probably weighs fifteen pounds, though he is very fat now. His nose is pointed very much like a fox. The mother was shot at by some one and has not been seen since. N. H. B.

THE N. A. K. C.—Business of immediate importance demanding it, there will be a special meeting of the National American Kennel Club at the Hippodrome Building, New York, on Thursday, May 10th, at 10 o'clock A. M.

N. ROWE, President.

CHARLES H. TURNER, Secretary.
St. Louis, Mo., April 7, 1877.

—According to *Land and Water*, "1,373,936 dogs paid duty during the last financial year in Great Britain, showing an increase of more than 100,000 in spite of the nefarious practices of the dog poisoners in London and other places. The dog tax, however, is still greatly evaded, and a good deal of trouble and expense is the consequence."

Sea and River Fishing.

FISH IN SEASON IN APRIL

Speckled Trout, *Salmo fontinalis*. Land-locked Salmon—*Salmo gloveri*. White Perch, *Morone Americanus*. Shad, *Alosa*.

*** For trout flies in April, see our issue of March 29th.

FISH IN MARKET.—We have to quote generally lower prices for all description of fish this week. North River shad are, owing to the high winds, not nearly as abundant as they should be. Cod are very plentiful. We quote: striped bass, 18 cents per pound; smelts, 18 cents; salmon (frozen), 30 cents; shad (southern), 30 to 50 cents each; native, do. 50 to 75 cts.; white perch, 15 cts. per pound; Spanish mackerel, 50 cts.; green turtle, 18 cts.; terrapin, $15 per dozen; frostfish, 8 cents per pound; halibut, 18 cents; haddock, 8 cents; codfish, 8 cents; blackfish, 15 cents; herrings, 6 cents; flounders, 8 cents; sea bass, 20 cents; eels, 18 cents; lobsters, 10 cents; sheepshead, 20 cents; turbot, 20 cents; scollops, $2 per gallon; whitefish, 15 cents per pound; pickerel, 15 cents; Canada brook-trout, 25 cents; Long Island trout, $1; hard shell crab, $3.50 per 100; red snappers, 18 cents; prawns, $1.50 per gallon.

SOME FINE TROUT.—Some of the finest trout taken for years on Long Island with the fly were captured last week at Lakeside, the residence of Jno. W. Masury, near Eastport. One of them weighed full 2¾ pounds, and the aggregate of six fish was eight pounds six ounces. The gentleman who was so fortunate as to make this fine catch is as well-known for his modesty as his skill in all matters pertaining to flood and field, and in deference to his desire we refrain from making his name public. We do not know the name of the fly with which the "big un" was taken, but believe it to have been a "Palmer."

—The St. Lawrence River is clear of ice at Clayton, and the ferry-boats are crossing to Kingston.

—Salmon are being caught with nets in St. Johns Harbor. There will be very little rod fishing, however, in New Brunswick before the 10th of June.

NEW PATTERNS IN TROUT FLIES.—Dr. A. H. Fowler, the rod and reel manufacturer of Ithaca, New York, has a new black bass fly which he claims is the most killing that he has yet met with. It has a white body, scarlet ibis, and white wings, and a scarlet tail. Reuben Wood of Syracuse, has a white moth with grey wings (mallard) which ought to do good service as an evening fly, or in cloudy weather.

—Three pictures of trout, painted by Mr. T. Sedgwick Steele, of Hartford, Conn., have all been accepted and hung in the exhibition of the New York National Academy of Design. This acceptance by the committee is a decided compliment to Mr. Steele, whose pictures have now been hung by both the Brooklyn and the New York Academy's committees. The larger one of these three, entitled "The Best of the Lot," is his most ambitious production; the other two are panel pictures. In the former there are four trout hanging up; a tempting sight. The panel pieces are contrasting pictures, presenting front and back views of three trout in each, so adjusted as to present two trout in contrasting positions in each.

VERMONT *Ferrisburgh, April 6th.*—Pickerel are beginning to play, and large numbers are being shot. I hear of one man turning up nine at a single discharge. The water is very low for this season, and there is every prospect for an early spring.

MASSACHUSETTS—*New Bedford, April 4th.*—Our close season ends April 1st, and punctually on that day a variety of fishermen from the experienced old graybeard to the verdant youth whipped the waters of our swollen streams with fly-worm and minnow, but only a very few had anything but empty baskets to exhibit. On their return a very few exhibited trout of some six inches length, caught near the salt water; but these who tried the inland streams found the country completely flooded, and not a trout could be found green enough to be caught on All Fools' Day. CONCHA.

FISHING MOVEMENTS.—The late unfavorable weather has interfered with the curing of codfish, and the stock on the market in shipping order is extremely light, and it is not easy to fill orders at once, although the call is very light for the season. The fleet continues to bring in light fares, and prices are fairly maintained. The number of fishing arrivals the past week has been 33—1 from Grand Menan, 3 from Grand Banks, and 29 from Georges. The receipts have been about 600,000 pounds of Georges codfish, and 240,000 pounds halibut.—*Cape Ann Advertiser, April 7th.*

"FENTON'S"—OR "NUMBER FOUR."—Who has not heard of "*Number Four*," in the Adirondacks? Our correspondents often refer to it. Perhaps it will serve some of our readers if we print what one of them, well known in reporting circles to the northward, says of the place. Here lies our enthusiastic friend's apostrophe:

> "Oh, how happy! here's our leisure!
> Oh, how innocent our pleasures!
> Oh, ye valleys! Oh, ye mountains!
> Oh, ye graves, and crystal fountains!
> How I love, at liberty,
> By turns to come and visit ye!"

Notwithstanding the almost resistless tendency to seek new fields for angling that has possessed me for twenty years, I find myself again, for the fifth season, drawn toward Fenton's, where I have already engaged quarters for myself and family for the month of July. This is, however, not strange, as my many long trips through various parts of our great "Adirondack Wilderness" eminently qualifies me to form a correct judgment as to where I, at least, can secure the greatest amount of real pleasure. Of course, in this I include my family, who have been co-laborers with me on many of these trips. Charles Fenton's Number Four, Lewis County, although quite in the forest, is nevertheless but eighteen miles from Louisville, on the Utica and Black River Railroad, and Mr. Fenton usually carries parties to his place in about five hours. The buildings are located in the centre of a large clearing, in full view of Beaver Lake (which is about a quarter of a mile off), and commands one of the finest views that I know of in the woods. Fenton writes me that he has deposited 20,000 salmon trout fry (*Salmo confinis*) in the lake, which will afford fine sport to those who do not care to work to catch fish.

Speckled trout abound in every stream in this section, and to my mind the pleasure is greatly enhanced by tramping to some wild stream miles away, or sailing through boiling rapids, and casting deftly the delicate fly upon the water and witnessing the leaps of the speckled beauties after the tempting lure.

Here, pure, sweet milk is furnished as lavishly as the water from the well, which, in the language of the table on the curbs, *is* "the best in the world."

Messrs. Editors, you ought to go there, as several journalists, who, like yourselves, exert a good influence in the world, are in the habit of doing. I am confident it would increase your happiness, give additional length to your days and power to your pen. Respectfully,

W. W. HILL.

WINTER FISHING IN LAKE MICHIGAN.

BAY CITY, Mich., March 16, 1877.

EDITOR FOREST AND STREAM.

Having a leisure hour, I will pen you a letter from this northern country. Bay City has a population of 10,000, and is located on the east bank of the Saginaw River, four miles from its mouth, where it empties into the Saginaw Bay. It has a large and increasing number of salt works, manufacturing a staple to which there is no limit. Its fish trade rivals Newfoundland in its extent, and is yet in its infancy. Most of your readers have, no doubt, read of the Fishing City out in Saginaw Bay; for them we will give a few notes. Standing on the shore of Saginaw Bay, we see in the distance a large number of black dots on the ice, the close approach to which will show a large village of over 300 shanties. This is the Ice City. Few persons realize the stupendous undertaking, wherein some 2,000 men live in temporary shanties on the ice, engaged in fishing, from December to the latter end of March, subject to all the vicissitudes of such a life. The readers of the FOREST AND STREAM will remember, that a few years ago three hundred of these hardy fellows were carried out to sea, but fortune favored them with a change of wind, which brought them back next day. These shanties are about six feet square, high enough for a man to stand up in, and are made of undressed lumber. Each is built upon runners, so that they can be moved from place to place at will. The interior of all the shantics are alike—a row of berths on one side, and on the other a small stove, made expressly for these fishing-houses, and which serves to keep the interior comfortable. The occupants are four men, who work and watch. The mode of fishing is as follows: In the centre of the shanty a square hole is cut in the ice, about two feet each way, across which is extended a pole with a strong line attached; as a bait a piece of herring is fastened to the loose end of the string, but no hook is used. One man slowly draws the string to the surface, while the other stands ready with a spear. The fish, frequently two or three, follow the bait up, and when within striking distance are harpooned by the man with the spear. Another way is, with the wool trout line, with a number of hooks attached and baited with herring. This is let down through the hole and left for six hours, then drawn up. It usually gives a good return.

The village is governed by strict regulations, and the laws duly enforced. Over the door of a shanty somewhat larger than its mates we noticed the word "Saloon." Not far from this we found "The Fisherman's Home," where ample accommodation is found for man and beast. There are at the present time over 2,000 men fishing in the ice. The fish are sold at from 4½ to 7 cents a pound in the bay, being purchased by buyers who go out daily from the city, bring the fish back, and pack them for shipment to all parts of the world. It is said that an industrious fisherman, with good luck, will take from 60 to 100 pounds of fish daily. This mode of fishing seems to be peculiar to Saginaw Bay, and was first practiced by the Indians many years ago; but it has been only a few years since it has grown into such enormous dimensions. ROVER.

[A year or more ago our correspondent, "Ichthys," in describing the ichthyc fauna of the Great Lakes, gave our readers a clever description of the ice villages and the methods of fishing through the ice. The above article is none the less acceptable, however.—ED. F. AND S.]

SPORTING REMINISCENCES—MY FIRST REEL.

EDITOR FOREST AND STREAM.

The first few warm days of spring come to us, and the soft south wind brings a few stray blue-birds to tell us that trouting time will soon be here. How every old fisherman begins to have a touch of the piscatorial fever. The first symptoms are marked by the getting out of the little trunk, and a general looking over of lines and flies, repairing old, putting on new, and getting every thing in readiness, so that when the snow-water has ceased running some favored brook may receive our earliest attention. I have just been having my annual attack, although it will many a day between now and the time to wet a hook in this snowy locality.

Occupying a corner of my fishing-box, enjoying a long rest, lies my first reel, but with what different emotions I now handle it from those I experienced the day it was first placed in my hands. It is a small, single brass reel, with a stop. Then I thought it the "*ne plus ultra*" of reels. I was but a lad and had never owned a jointed rod—much less a reel. How I proposed to astonish the other boys by its exhibition, for reels were few in our neighborhood and only seen in the out-fit of visiting sportsmen. It, together with a twelve-foot jointed bass rod, was a present from a city friend. It was in September; I was ill at the time, and I longed to try it. In those years little I knew of close seasons; every spring in June I was accustomed to go and stay with uncle Nate B. and fish the trout streams emptying into the waters at the head of Lake George; and uncle Nate used to tell me, "that I ought to come in the fall and try the 'fall trout' when the big ones run up the streams after the first frosts," and wonderful stories of the large ones that could be caught in the lake at the mouth of the streams before sunrise and after sundown.

About October 1st I convalesced and was soon established at uncle Nate's, anxious for a trial of the new rod and reel. The next morning after my arrival, just before daylight, with the stars sparkling in the frosty air, I took my way across the Old Fort Field, with my rod ready for service in one hand, and a basin of raw, lean beef, cut in square chunks, for bait in the other, toward the mouth of the East Creek. By day-break I had the boat anchored, across the current from the stream, about fifty feet from shore on the sand-bar formed by the creek. I commenced casting into the current and letting my line run out with it until I had about eighty feet of line out, when I had a strike, and from the surge on the pole I knew I had a "lunker" (vernacular for big one). I obeyed the first impulse, which was to "yarn" him into the boat by main-strength, but I found that was one of the impossibilities, with eighty feet of line out, and then, and not until then, I thought of my reel, and with quivering fingers I grasped the handle, and for a moment or two tried to turn it without moving the stop, and after I had loosened it I could'nt manage the thing at all. First I would turn one way and my fingers slip off, and then I would turn the other, and all the time old *Salmo fontinalis*, splashing and splurging about, seemed as big as a whale. Finally I grasped rod and line tightly above the reel and leaped over into the icy waters and stopped not until I had towed my trout high up on the sandy beach. He was a three-pounder, and as with chattering teeth I made tracks for uncle Nate's kitchen fire, I began to coincide with his opinion expressed the night before, that "them new-fangled concerns didn't amount to much," but the whir of that little old reel has been the death knell of many a noble bass and trout since its first christening by FITZ.

RANGELEY LAKES.

RANGELEY, Me., April 2, 1877.

EDITOR FOREST AND STREAM.

I suppose your many readers will be interested in any news from this place. It is expected that there will be a grand rush for the lakes the coming summer. The new hotel at Rangeley City is now ready for the public. The former landlord of the old Rangeley Lake House, Mr. Eben Hinkley, is to be found in the new house. The house is 30x40 with L 40x50, two stories in height, all finished and furnished in the best manner. Fishermen and those who desire a quiet, home-like house in the midst of the best trout fishing in New England, would do well to correspond with Mr. Hinkley for terms, etc., which will be reasonable. The arrangements are completed for a through stage direct from Phillips to this place, arriving here in season for dinner the second day from Boston via. Eastern or Boston & Maine Railroad. The fine little steamer Molly Chunkamunk takes parties from here to all parts of the Lakes. There is but little winter fishing. The law forbidding the setting of hooks protects the trout for the summer fishermen.

The finely illustrated article on the Rangeley Lakes in *Scribner's Monthly* for February has created a new interest in these lakes, and as they are so extensive that there is no perceptible decrease in the size or number of trout, they are sure to remain the favorite resort for fishermen for a long time. I will from time to time let you hear of any news which will be of general interest to your readers from this place. RANGELEY.

FLY-FISHING EXTRAORDINARY—PLAYING A SNAPPING TURTLE.

EDITOR FOREST AND STREAM.

Perhaps you may deem the following somewhat singular incident worthy of notice in your columns.

In July last a brother angler and myself had just broken camp on Shobola after a week's sojourn delightfully spent along its shady banks. Journeying back to Westbrook's we stopped at "The Maples" to fish a few large pools. I had already taken some five or six fine trout and was in the act of drawing another of almost a pound in weight to the landing net, when suddenly an immense turtle of the snapping order rose from the sedgy margin of the pool, and seizing the exhausted fish at once struck out for deep water. Here was a dilemma. A six-pound turtle on an eight-ounce rod. Determined to fight, however, I "showed him the butt," as our angling friends across the water say, and yielding to the strain he turned and made straight toward me. On he came with head above water carrying the trout crosswise in his mouth. I called to my friend, who was near at hand, and stepping back to the bank, seized a stout stick in order to battle with this rude robber of what I considered my own especial prey. Just then my friend appeared and handing him the club he was about to administer a severe reprimand, when the turtle, taking in the situation, suddenly relinquished hold of the fish and sank out of sight. My fly still remained in the trout's jaws and drawing him to hand I found the fish uninjured except a slight abrasion just in front of the dorsal fin. Recounting the incident at Westbrook's that night, I was interrupted by "old Bart," who exclaimed, "Why in thunder didn't you catch um by the tail? we could have had turtle soup to-morrow." I said I didn't care for soup much. But several times during the evening I heard the old man regretting the loss of that turtle. B.

AN OLD ANGLER ON NEEDLE-POINTS.

GODEBOUT, CANADA, February 17, 1877.

EDITOR FOREST AND STREAM.

I had occasion to read a few days ago in your paper some correspondence about "needle points;" I therefore made up my mind to try them the first chance I could find, and now give you the result.

I made some hooks with the smallest sized darning-needles I could get, giving them what I thought to be the right bend, something like the Limerick hooks. Everything else being ready I started with a companion for a first-rate trout stream, which was soon reached. My companion being as good an angler as I was, we decided that we should both fish for an hour, he to use the barbed hooks, I the needles. After a few minutes' fishing it was very clear that the needles would win the day, and at the end of the hour the score stood as follows: "Needles, thirty-seven trout, several of them over three pounds; barbed hooks, sixteen trout, size about the same." Now, the reason for this great difference (at least in my opinion), was not owing to the needles hooking the fish better, but in the great saving of time which they effected, as I was never obliged to touch them, they wriggling off the hooks as soon as landed. My friend, on the contrary, had to lose a great deal of time in taking the hooks out of each fish. As some doubts had also been expressed about the possibility of landing a salmon with a barbless hook, I decided to try it, but am sorry to say I cannot side with Seth Green in that respect, as I only saved one out of four fish hooked which I am almost sure would not have happened had I used regular hooks. It seems to me (though I may be mistaken) that the most skillful angler cannot always keep a tight line on a salmon, especially when leaping, which he would be obliged to do if using "needle points." ANGLER.

[We regret that the letter of our correspondent should have been overlooked until this week.—ED.]

—The North Carolina Legislature has just appropriated $30,000 for the erection of a negro insane asylum in that State, and $10,000 a year to support it.

—Capt. Boyton has crossed the Straits of Messina, passing successfully through both Scylla and Charybdis during the prevalence of a severe gale, which caused the destruction of one of the accompanying vessels.

—Julius H. Seelye, now President of Amherst College, has given all his salary in Congress to the town of Amherst, to be expended in laying sidewalks.

Yachting and Boating.

HIGH WATER FOR THE WEEK.

Date.	Boston.	New York.	Charleston
	H. M.	H. M.	H. M.
Apr. 12	10 49	7 13	6 49
Apr. 13	11 33	7 55	7 32
Apr. 14	mid.	8 42	8 18
Apr. 15	0 35	9 35	9 06
Apr. 16	1 24	10 31	9 59
Apr. 17	2 15	11 31	10 56
Apr. 18	3 10	mid.	11 53

—The activity prevailing at the various yards indicate that the opening of the yachting season is close at hand. The schooner-yacht Peerless, of the Atlantic Yacht Club, has her running gear off, and is nearly ready to bend sails. She will go into commission this week. The schooner-yacht Triton, the flag-ship of the Atlantic Club, is also fitting out near the Peerless. The annual regatta of the Atlantic Club has been fixed for the 11th of June, and will be the first regatta of the large clubs. The sloop-yacht Schemer is fitting out at John Mumm's yard, foot of Court Street. She has had an iron shoe put on her, weighing 1,650 pounds. The sloop-yacht Orion is fitting at the same yard.

ATLANTIC BOAT CLUB.—The Atlantic Boat Club, of Hoboken, N. J., now the oldest in the United States, held their annual meeting on Thursday evening last, when the following officers were elected: President, H. Offerman; Vice-President, W. H. Curtis; Recording Secretary, R. S. Murray; Corresponding Secretary, F. Emerich; Treasurer, James Reed; Captain, C. Erienkotler.

THE YALE-HARVARD RACE.—MESSRS. Weld and Bancroft, of Harvard, and President Davis, of Yale, on the 7th inst. went over the Thames course at New London, proposed by Harvard for the Yale-Harvard boat race next summer, and heard the offers of the New London people to pay all the expenses, guarantee a clear course, build boat-houses, and furnish transportation along the river bank during the race. Harvard strongly favored this course. The same evening these gentlemen and Captain Collin and ex-Captain Cook decided to adhere to the Oxford-Cambridge rules and pull on June 29th, the day after Commencement. They spent several hours discussing the question of the course, but left the matter undecided.

SOUTH BOSTON YACHT CLUB.—The annual meeting of the club was held at their House, foot of Sixth Street, last evening. The report of the secretary give the membership at 136 and a roll call of over forty yachts. The report of the financial secretary places the organization in a flourishing condition. The club starts this season as an incorporated body. The following officers were elected: For Commodore, M. J. Kiley; for Vice-Commodore, W. J. Orcutt; for Fleet Captain, Dr. R. Disbrow; for Measurer, J. Winniatt; for Recording Secretary, William Morris; for Financial Secretary, Harvey N. Follansbee; for Treasury, Thomas Christian; for Trustees, H. J. McKee, J. H. Giblin, J. G. Chambers. After remarks by the new Commodore, and others, the club adjourned to the Atlantic House, and partook of one of Fred. Wright's bounteous collations. Prof. Ryerson rendered some very pleasing instrumental and vocal music, which was much applauded.

The club enjoyed the presence of Com. Geo. Brown and members of the Bunker Hill Yacht Club.

A very pleasant, social evening was passed, which will long be remembered. Much courtesy was extended your correspondent.

We extend to Com. M. J. Kiley our congratulations, feeling that the institution will grow under his careful management. "KEDGE."

QUINCY YACHT CLUB.—At the annual meeting of the Quincy Yacht Club, held Saturday evening, 7th inst., at Quincy, Mass., the following officers were elected: Commodore, James H. Slade; Vice-Commodore, H. A. Keith; Secretary and Treasurer, Chas H. Porter; Measurer, Peter B. Turner; Regatta Committee, E. B. Souther, J. T. Penniman, G. W. Morton, B. F. Curtis; Membership Committee, B. F. Bast, Geo. W. Morton, George Saville, W. H. Nicholson, P. B. Turner; Judges J. T. Penniman, E. B. Souther, C. H. Porter, A. Lelois, John O. Holden, E. P. Worster, Edward Whicher; Fleet Captain, H. M. Federhen. On motion of Mr. W. H. Nicholson it was voted to change the time allowance to that of Dorchester Club. The prizes won at last year's contests were distributed, and as usual they were unique and elegant.

—The Shawmut crew has already commenced work, with Mahoney as coach.

—Meeker, late backer of the New York crew, is ready to match Plaisted against any oarsmen in New England.

—Great interest is already shown in regard to the June races at Silver Lake, and a fine regatta may be expected. It now looks as if the second race in four-oared shells will take place, as Hanlon has sent notice that he will be present with a crew. A statement is made that O'Brien and O'Connor, formerly of the Longshore crew of Portland, are to pull with Faulkner and Regan, though this is not definitely settled upon. Efforts are being made to induce the Halifax and Pittsburg crews to be present.

—The secretary of the Ontario Rowing Club has forwarded a deposit of $100, gold, as forfeit on behalf of Edward Hanlon of Toronto, for a match between Hanlon and William Scharff of Pittsburg, the race to be a three-mile pull on Toronto Bay, and Scharff to be be allowed expenses.

Hanlon has also deposited a forfeit with a Canadian sporting paper as an earnest of his desire to make a match with Wallace Ross of St. John, N. B. Hanlon offers reasonable expenses if Ross will agree to row a three or four-mile turning race on Toronto Bay, on or about June 6th, the match to be for $1,000 a side.

—The Neptune Club, of Staten Island, will have one of the strongest amateur shell crews in the country, consisting of Ostrom, of Cornell College, stroke; Kennedy, of Yale College, No. 3; Courtney, the champion amateur sculler, No. 2, and Riley, who made the fastest two miles on record at the Saratoga regatta last year, as bow. They are entered in all the regattas, and their meetings with the Northwestern, Atlanta, and Argonauta crews will be watched with interest.

—It is the intention of the Potomac Club to inaugurate a series of regattas, which will take place semi-monthly during the season.

—The Analostans will shortly commence the erection of a pavillion at Table Rock, their up-river headquarters.

—The champion shell crew of the Potomac Club, Messrs. Coughlin, McBlair, Randall, and Trunx, who made such a brilliant record during the season of 1873, '74, '75, have disbanded, the three latter retiring from the crew.

—Besides having a race with their old antagonists, the Potomacs, it is the intention of the Analostans to get on a series of races with the Undine Club, of Baltimore, the champions of Patapsco Bay.

National Pastimes.

COLLEGE ATHLETICS.—The annual Convention of the Athletic Association of American Colleges was held at the Fifth Avenue Hotel last Wednesday. Representatives from the following colleges were present: Amherst, Columbia, Dartmouth, Harvard, College of New York, Princeton, University of Pennsylvania, Wesleyan, Williams, and Yale.

The following officers were elected: President, C. W. Francis, of Columbia; Vice-President, Cyrus W. Field, Jr., of Williams; Secretary, G. S. Philler, of University of Pennsylvania; Treasurer, J. A. Campbell, of Princeton; Executive Committee, C. W. Francis, of Columbia; J. C. Morrell, of Amherst; E. H. Herrick, of Harvard.

The question of track and place for the holding of the annual athletic competition was then submitted. Various suggestions were made, but at last the Convention decided that New York presented the greatest attractions, and the track of the New York Athletic Club, at Mott Haven, unusual facilities for a successful meeting. To this end the Executive Committee were instructed to solicit the use of the track for the day upon which the sports may be set down to take place. The meeting will be held in May or June.

The programme of events for the annual competition was decided to be, the first and second for graduates, and the balance for undergraduates. One mile walk, three graduates to enter and start; dash of 100 yards; one mile walk; two mile walk; half-mile run; dash of 100 yards; dash of 220 yards; one mile run; hurdle race of 120 yards, over ten hurdles placed fifteen feet apart, and of three feet six inches in height; one-quarter mile run; throwing the hammer, sixteen pounds; running high jump; running broad jump; pole vaulting; putting the shot, sixteen pounds.

O'LEARY AND WESTON.—Dispatches from London, dated the 8th inst., give the result of the long distance walking match between these celebrated pedestrians. The match was for £1,000 a side, the winner to be the one walking the greatest number of miles in six days. O'Leary proved to be the best man, walking 520 miles to Weston's 510. Both men began walking at 12.05 A. M. on the morning of the 2d. O'Leary sporting as colors a combination of the red, white, and blue of the United States with the green of Ireland; Weston sporting the canary and green of Sir John Astley, who furnished nearly all, if not all, of the £1,000 for which he was backed. The race from start to finish was a terrific one, especially during the first three days, when O'Leary got a lead of twenty-three miles, which Weston was unable to overcome, though during O'Leary's illness on Thursday he nearly made up all the lost ground. As may be expected, both men were badly used up, although not nearly so bad as was generally expected. Both, however, have the consolation of knowing that they beat all previous performances, and are respectively first and second champions at long distance walking.

BASE BALL.

—A splendid fielding game was played at Indianapolis on April 3d, on the occasion of the second return game of the series between the St. Louis and Indianapolis Clubs, the first of which was won by the latter nine on April 2d, by a score of 5 to 3. It will be remembered that the first game between the two nines played in St. Louis, March 21st, resulted in the success of the St. Louis time by 6 to 3, the second being won by the Indianapolis nine the next day by 6 to 4. The return games were looked forward to with interest, the Browns anticipating success; but they found the local team of Indianapolis decidedly too much for them, and in consequence they returned home defeated, there loosing three games out of the four played. This is not as favorable an opening of the season as the crack League team of St. Louis expected. One result will be a decided increase in the interest taken by the western fraternity in the coming contests between the League and International clubs. Below will be found the correct score of the model game played on the 3d inst. in Indianapolis:

ST. LOUIS.	R.	1B.	P.O.	A.	E.
Clapp, c	0	0	8	3	0
McGeary, 2 b	0	1	1	2	2
Battin, 3 b	0	0	3	2	0
Force, s. s	0	0	2	3	0
Remsen, c. f	0	0	2	0	0
Doran, l. f	0	2	2	0	0
Croft, 1 b	0	2	8	0	1
Blong, r. f	0	1	1	0	0
Nichols, p	0	0	0	5	0
Total	0	6	27	15	3

INDIANAPOLIS.	R.	1B.	P.O.	A.	E.
Quest, 2 b	0	3	4	7	0
McSorley, c. f	0	0	1	0	0
Mack, s. s	0	0	1	2	0
Houtz, 1 b	0	0	16	0	0
Golden, l. f	0	1	0	0	0
Flint, c	0	1	4	1	0
Warner, 3 b	0	1	1	6	0
Rocap, r. f	0	1	0	1	0
Nolan, p	1	1	0	1	0
Total	1	8	27	18	0

St. Louis	0	0	0	0	0	0	0	0	0=0.
Indianapolis	0	0	0	0	0	0	0	1	0=1.

Umpire, Chapman, of Louisville. Time, 1:30.

Earned runs, none; first base by errors, Indianapolis 3 times.

—On April 7th the new Athletics opened play in a match at Riverton; played with the amateur club of that place. The Athletic men included "West," Weaver, Fisher, Reach, Meyerle, Fulmer, Trott, Sensy, and Coons. The score was very one-sided, the figures being 25 to 2 in a seven inning game. The catcher put out 12 players off Weaver's pitching.

—The Louisvilles opened play in a game with picked men on April 7th, thus playing their team as follows: Snyder, Devlin, Latham, Gerhardt, Hague, Craver, Hall, Chapman, and Schaffer. Crawley caught and Lafferly pitched on the field side, Pease playing at centre-field. The nine won easily.

—The Hartfords play the Alaskas on the Capitoline grounds on Friday.

—The new professional nine of San Francisco have taken the field. They began work by defeating a strong picked nine by a score of 12 to 3.

—Base ball clubs are being organized for the season by the dozen. At the rate new clubs are springing up, there will be 2,000 nines on the field by June.

—The new regulations governing the use of the ten regular base ball fields located on the parade ground at Prospect Park, Brooklyn, a field nearly half a mile long by nearly a quarter wide, and all of level rolled and cut turf, will this season exclude all nines from playing which do not belong to regular base ball clubs, and these will have to get permits for every game they play.

—The Philadelphia nine has been engaged, and they will take the field shortly against the Athletics. The nine is as follows: Malone, catcher; Lomas, pitcher (said to be very swift); Abadie, first base; Farquhar, second base; Richardson, third base; Dunlap, short stop; Treacy, left field; Eggler, centre field, and Bechtel, right field.

—The Boston umpires for 1877 will be Messrs. Sumner, Chandler, Farmo, Chepper, and G. F. White. The Brooklyn umpires will be Messrs. Ducharme, Kenny, Bunce, Clare, and Brennan.

—The following is the score of the game played April 7th, on the Capitoline Grounds, Brooklyn, on which occasion the Hartford's placed their full nine on the field except Joe Start. They played finely, as the score shows.

Hartford	1	3	0	1	0	5	0	2	3—15

Umpire, Mr. Ducharme; time of game, 2 hours; first base by errors Field, 1, Hartford, 6; runs earned, Field, 3, Hartford, 6.

—The Indianapolis Club will play in Chicago on April 28th.

—The Cincinnati Club's Captain has wisely decided to play Hallinan at second base, and to keep himself in his home position in the out-field.

ILLEGAL DUCK SHOOTING.—John Reeve, John Summerman, and George Hatch were arrested on Saturday by constables Geo. H. Gardiner and Thomas McDonald, of Brooklyn, Anne Arundel County, charged with shooting at wild ducks from a boat in violation of the Maryland laws relating to wild fowl. The men were taken before Justice Hawking, who imposed a fine of $10 each, and confiscated the guns and other appurtenances. Being unable to pay the fine the gunners were committed to the Annapolis jail. The county officers stated that for some nights previous shooting ducks had been practiced from boats carrying lights, but they had been unable to catch the offenders. Saturday morning several boats were out near the Long Bridge. The officers chased the boat in which the accused were and caught them after quite a long chase. The men state that they were entirely ignorant that they were violating any law. Two of them are married men with families. The law imposes a fine of from $10 to $100 for shooting at wild fowl from any vessel, float, canoe, or other craft, or from any blind over one hundred yards from the shore. Any person supplying a boat to be used in violation of law is also liable to the same penalty. All boats, guns, and utensils used are forfeited under the law.—*Baltimore Sun.*

A WHITE DEER.—An Escanaba (Michigan) correspondent says that a white deer was shot there last fall—perfectly white, the only dark hairs being behind the ears. The hoofs were almost transparent. It was a two-year old buck.

We notice that the old firm of E. Walker & Sons, established in 1836, will remove May 1st from 55 Dey Street to their new quarters, No. 14 Spruce Street. This is one of the the oldest, as it is certainly one of the largest, book binderies in the city. Their facilities for large and small jobs are not excelled by any other house, and for promptness and workmanship we can attest. There is none better.

Tiffany & Co., Silversmiths, Jewelers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their timing watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. Tiffany & Co., are also the agents in America for Messrs. Patek, Philippe & Co., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Bronzes and Artistic Pottery is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. Union Square, New York

GENUINE

STAMPED

From the reputation these Meat Fibrine Cakes have now gained, they require scarcely any explanation to recommend them to the use of every one who keeps a dog, suffice it to say they are free from salt, and contain "dates," the exclusive use of which, in combination with meat and meal to compose a biscuit is secured to us by Letters Patent. For sale in cases of 112 lbs. each, F. O. DE LUZE, sole Agent, 18 South William street, New York. Special terms to dealers.

DOGS CANNOT SLIP THIS COLLAR

No matter how violently they pull, this collar will not choke or injure the dog. Made of heavy bridle leather with nickle plated trimmings. Sent by mail with name of dog or owner on name plate for $1.00. Manufactured by

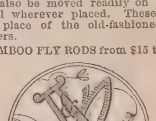
BRADFORD & ANTHONY,

374 Washington Street,
BOSTON, MASS.,

Importers, Manufacturers and Dealers in



Offer their usual extensive assortment of STAPLE GOODS, and are introducing this season some NEW and DESIRABLE articles. We call attention to the

PATENT ADJUSTABLE FLOATS AND ADJUSTABLE SINKERS,

which can be attached and detached at will, without knotting or tying the line, or removing the bait or hook. Can also be moved readily on the line, and remain fixed wherever placed. These are rapidly taking the place of the old-fashioned floats and ringed sinkers.

SPLIT BAMBOO FLY RODS from $15 to $50 each.

We make a specialty of Artificial Flies. Our stock is unequalled in variety and extent, and unexcelled in quality.

BRADFORD & ANTHONY received the award of the U. S. Centennial Commission in 1876 for "Exhaustive Variety of Anglers' Apparatus, especially HOOKS, LINES, RODS, ARTIFICIAL FLIES, * * of the BEST QUALITY."

Our Illustrated Wholesale Catalogue of Fishing Tackle will be mailed to any dealer whose address is sent to us. 5apl4t

First Prize Medal and Diploma awarded Centennial Exhibition, for excellence of workmanship and material in their **Premier Quality** and medium grades. Their **New Patent Triplex** Lever Grip Action and **Compensating Lump.** The attention of sportsmen is requested to the above new action. Its superior strength and solidity impart greatly improved shooting powers. Hard hitting, being the desideratum required, is obtained by this powerful gun. Prices of the New Triplex Lever Grip, $175, $225 to $400. Marked the Triplex 10-bores extra. Our highest grade is as usual marked the PREMIER QUALITY.

Extract from FOREST AND STREAM, *New York, December 26, 1876, Contributed by one of the Judges of Awards of Guns at the Centennial:*

This action (The Triplex Lever Grip) combines in the highest degree strength and simplicity, and must rapidly secure the favor of all who test its merits.

COMPENSATING LUMP. Strongly recommended. It is invaluable, and should be ordered on every gun. Costs about $10 extra. Choke-bores, medium or full. Our guns to be had of the principal dealers in the trade only.

Miscellaneous.

A Sportsman's Opportunity

A GENTLEMAN OWNING A LARGE farm, situated in a fine shooting district near Philadelphia, wishes to arrange for a resident partner upon the farm. A Sportsman's Club is now in process of formation, and it is proposed to stock the adjacent waters with fish and to lease adjoining lands for shooting purposes. 1,000 acres have been already secured, and arrangements have been made for a full supply of fish for stocking the streams. A gentleman of leisure, who is willing to reside 6 months or more upon the farm will find this a pleasant business connection. For further particulars address E. L. SPACKMAN, 123 South 3d St., Philadelphia. mar15 tf

THE MOUNTAIN LAKE.

BY C. EDGAR BUFFUM.

WHILE o'er my office books I bend,
Or write out bills and letters,
Off to the woods my fancies wend,
Freed from these irksome fetters.
Again we dip the oar,
Waters and woods explore.
I see dim, golden mountains shine,
All hazy with a light divine;
O, will those scenes once more be mine—
Shall I behold them more?

The curving beach of moistened sand,
With wild deer foot-tracks printed,
The cliff by eagles' pinions fanned,
Dark forest moonlight tinted!
Shadowed by rocks, storm hewn,
Beneath the midnight moon
The lonely lake in beauty lies,
And mirrors back the starry skies,
And echoes to the loon's weird cries,
The laughter of the loon!

When early sunlight tips the hills
With blushing color glowing,
The lake's cold bosom stirs and thrills,
Soft winds the mists are blowing;
And through its silver sheen
The frowning crags are seen,
Till upward, rolling through the air,
White clouds disclose a landscape fair,
Bright waters framed in green are there,
In woods and meadows green.

Once more in thought "my lines are cast"
Within these "pleasant places;"
With friends of yore I live the past,
And see their happy faces.
On fragrant boughs we lie,
Or cast the whirling fly:
Make music with the spinning reel,
As with the rod the trout we feel,
Or make the speaking rifle peal,
And hear the echoes die!

In sylvan camp among the trees,
With bed of soft, dry mosses;
Where we, extended at our ease,
Defied life's cares and crosses.
The pure cold-water spring,
The stoves set in a ring;
Where at the coming of the night
Our fire blazed with its cheerful light,
Each one felt "king in his own right,"
As happy as a king.

There oft in dreams my fancies tend
This cold and dreary weather,
And once again, my dearest friend,
We roam the woods together.
I see the sunshine gleam
On mountain, pond, and stream;
And all these in my visions shine,
Dim, golden, with a light divine,
And I am glad this dream is mine,
And is not all a dream!

Quail Shooting Extraordinary.

"OPTICS, come in! You are the very person I want to see. You said you wanted to go quail shooting. Now, if you are of the same mind, meet me at —— Depot to-morrow morning at 6 o'clock with about fifty or sixty shells loaded with No. 8 or No. 9 shot, and I will take you where I know there are two or three bevies of quail. I am going to work a new dog I had sent to me, and can't therefore promise much sport, as 'Pat' is untried on quail, so far as I am concerned. And 'Larry,' my reliable, is laid up with the distemper. Your dog, you tell me, is unbroken, and we, as a matter of course, will not want him to spoil a day's shooting by taking him along."

"All right, my boy! I will be with you, although I'm afraid you will be disgusted with me, for I am somewhat indisposed, and unfit for a day's tramp."

So we agreed.

True to our appointment, we boarded the train the following morning for a twenty-five mile ride on the railroad. The morning was hazy, threatening cold, and the leaden skies unpromising, but we were hopeful, as "Old Prob." had been consulted in an early edition of the morning paper, and assured us there would be no rain that day.

We bowled along rapidly, until at length the polite conductor informed us that the next station was where we were to alight, and we gathered our traps as the whistle sounded shrill in the morning air at our destination. Alighting on the platform I was much surprised and no little amused to see standing near the station a Son of Erin whom I had known as a city friend of the farmer with whom we were going to make our headquarters for the day, and who lived about a mile from the station.

Our Milesian friend was bedecked in all the paraphernalia of the natty sportsman. A canvas shooting suit—leggins—and game bag too. A speckled mongrel setter, who looked as though his mother had been scared by a Dalmatian dog, sat in the mud at his feet.

His firearm was a muzzle-loader, and its age not quite in keeping with the new style of his garments. He looked altogether, as he stood dramatically leaning on the muzzle of his *cocked gun*, as though he were determined to dress and do the character he had assumed at all hazards: no joke intended.

Tall and angular, with shoulders stooped, his coat (made for a heavier man) bagged behind, while his new game-bag with its wealth of netting and fringe bagged in front. A spectacle! Man, gun, and dog, all in a row on dress parade. There was blood in his eye as he returned the amused stare of the passengers with a deep frown, and in stentorian tones warned the shivering cur at his side not to stir, on pain and penalty of death. As the train passed on he deftly threw his gun to a position of "right shoulder shift" as his features relaxed into a smile of recognition of me as an acquaintance whom he was glad to meet; he spit on his hand and extended it, which I did not affect to see, but approached him and indulged in some exclamations of surprise at his sportsmanlike proclivities, which he assured me were of no recent growth. I shortly said:

"Cornelius, how is the quail shooting this morning?"

"Ha! it's beautiful, an' there's dead loads of it. In the big rag weed-field beyant, there is more nor two hundred burds this minit," answered he.

"Ah! how many bevies did you put up this morning?" I asked as we started toward the house.

"Bivies! divil a bivy," answered he; "but they were leppin up all over the field. If 'Fagin' there could spake, he'd till you a quare story of the shutin we've had this mornin'."

"Have you killed any?" I asked, as I took hold of his game-bag, in which I felt only a flask and a package of lunch.

Pushing my hand away he spiritedly answered in a loud voice—"Killed any? Indade did I thin—and plinty; sure I knocked down eight or nine of thim this mornin'—and once a fine double shot at that; I pulled both barrels at a fellow that was flyin' more nor eighty yards away and knocked him stiff, but didn't the bugger hide in the grass afther I killed um. Fagin an' me lucked for more nor a quarther of an hour for um."

"Where are the others you killed, Corney?" I asked, when, with a look of pity and contempt for my ignorance, he rejoined:

"Where are they? Why dear man, the grass an' wades are so thick over there that a checken howk could not find a burd that ud dhrop dead in it. I'll show you where I thramped and kecked great places aroun' for to find the burds I killed this mornin'."

"Fagin's a droll name for a setter. Is he of pure breed?" I ventured to ask; quietly observing that the object of my attention was a rather thick, heavy set dog, with ears somewhat short, hair thick, and sprinkled with liver upon a dirty white ground; head large, nose short, tail long and much inclined to curl; but innocent of feather; a regular nondescript, with a suspicion of the setter in him, and a stronger suspicion that his ancestry included dogs of many kind and degree. He was covered with burrs, which he continually tried to rub off against the fence-boards as he ran along. Any space that was uncovered with burrs was supplied with mud, which was in streaks, as though he had been held down by Corney and beaten with a muddy stick for some real or imagined unsetterlike behavior.

With a confident and assuring air he answered, "Pure! indade is he! He's out of the purest stock of setthers in Ameriky. He's a wee bit durty now," continued he apologetically. "I bate the haythen in the road up there, and cum near smudtherin' um in the mud, for a cuttin' me wid his teeth when I tuk hum be the ear fur barkin' at the farmer's hogs."

"Is he pretty well broke? and does he point well and stanchly?" I asked.

"Well troth now," he replied thoughtfully and cautiously, with the air of a man whose principles would not allow him in a moment of calmness to overstate facts, "he is purty well broke, an' he pints fairly fur a *young* dog. But he's not intirely larned to it yet, fur he pints purty crucked sometimes."

"Ah! does he? Well, young dogs *will* do that," I said, and in order to further draw him out added, "He'll get over that when he gets more experience. He gets his work in a little crooked, does he?"

"He does occasionally; now yesthurday I was mad enough at um to keck the stuffin out of um. Faith I did keck um too. He pinted a burd to the forrad of um, and was as purty and as stiff as a poker. Ah! dear man, you should ha' sane um. 'Me fine misther quail,' says I, 'I'll just sand ye a little on the groun'; it'll make Fagin thrue on his pint.' There's no betther way to make a dog thrue to his pint than to kill burds fur um on the ground," he assured me. "Well, I was luckin for the burd in the grass about six yards ayant the dog's nose; and blast me but the thafe flew from in unther Fagin's belly, and scairt the life out o' me, and got away too," said he, bursting into a forced laugh. "An' didn't the blackguard dog turn round and luck at me as ould fashioned as ye plase. Will he get over that cruckedness in his pint, dye' think?"

"Oh, undoubtedly, he'll be all right when he gets up to his work. Does he charge?" I asked.

"Charge!" said he, his eyes flashing as though that was a piece of work he was in the habit of enforcing upon the attention of the dog. "Oh yis; but sometimes he don't charge as he shud. Now yestherday, I tuk um up to a thicket where I drew some burds into, an' I towld um to charge! but divil a fut would he stir in. Well, I'm too ould a hauler of dogs to let oney one of thim git the besht o' me. So I tuk um be the neck, an' I dragged the beggar all through the brush, shoutin' to um to charge the whiles, an' be'gorra me gun caught in a faggat an' went off as I was pullin' um, an' came near shutin the farmer's boy, who was followin' me to carry the game. But that's no objiction to the dog, as I'm towld them pure bred setthers in this country don't like to charge through briars like the pinter. But in an open field the curse is all right man! When the gun goes off in an open field the devil wouldn't howld um. Sure there's not a field but he'd charge all over it than less nor five minits whin the gun goes off! An' he's the buy that 'ud have the air filled wid burds quicker nor tin min cud shoot thim. I'll show you what a dog he is if you stay out wid me to-day." He looked back and saw Optics trudging his weak and weary way through the mud, and said, "Who's yer frind that walks so slow? he's a callin' for you to howld on. Sure *he's* no hunter."

"Oh yes he is," I answered; "he's a famous wing shot; and he's a very distinguished surgeon too, and opthalmologist." That word had a convincing effect upon him. "And moreover he is ambidextrous, both as a surgeon and sportsman. Can make the most delicate operation on the eye with the scalpel in either hand, or kill his bird neatly in the air at long range; throwing his gun to either shoulder gracefully, as suits his whim or convenience."

"Well, well! he's a decavin fellow, aint he now?" said Corney at this.

"He is indeed," I replied; "and by the way, his gun is one of the finest I ever saw; get him to show it to you. He's not very well to-day, but he has good wind and will keep going."

"Has he good wind?" repeated Corney, recovering some of his wonted self assurance and wit. "Thin he'd betther swop some of his good wind fur a dacint pair of legs whin he goes a huntin' wid ye. But sorra, if he shutes like you say, he'd kill plenty th' day if he'd thramp a little fasther. Is his dog a gude won? I don't like the luks of um at all."

"Now, Corney, don't run down that dog, he's mine. Although I've never worked him much, yet he's an Irishman like yourself, and a decent enough dog," I answered.

"Well now, I'd take the blackguard for to be an Irishman sure! for didn't the bugger begin fightin' Fagin as soon as the baggage masther chucked um off the car! Is he broke?" he asked.

"He worked on chicken pretty well in Iowa, but have never tried him on quail" I replied.

"Chicken!" said he, "chicken! thin Fagin's the buy to work on chicken. Sure I've seen him stan' pintin a chicken fur more nor an hour in my yard, an' if I'd tell um to charge, he'd niver rist till he'd tear it to blazes."

"You've had a good deal of experience, Corney, with setters have you?" I said. This flattered him somewhat, and he assured me he had, and had owned and bred some of the finest stock of that kind in Ireland, but since coming to this country the business of contractor had so engaged his life that he was rather rusty on matters pertaining to dogs and field sports; but he was going to give his old and favorite pastimes more attention, and suggested that we should hunt a good deal together. I inwardly determined we should—*not*.

By this time we had reached the farmhouse, and were shown to a room, where Optics and myself put on our shooting clothes; while Corney bethought him that the business that had taken him to the station had been forgotten by him; and he excused himself, with assurances that he would return soon and join us.

Off we started to the field that had the "two hundred birds in it." We saw many signs where they had roosted, and Pat challenged occasionally; but the birds having been driven to the woods and adjoining thickets, there were poor prospects for much sport this morning. The birds hopelessly scattered would not gather till afternoon, but would then be all right for the evening shooting.

We agreed to give Fagin and his master a wide berth if possible, and after beating the fields thoroughly, we hunted up wind through the adjoining woods without success.

"Optics," I then said, "let us go down over that run and beat that cover on the hillside yonder, for a pheasant or two."

"No, my dear fellow, I'm too sick this morning and will hunt about here until you come back. I can't follow your long legs anyhow," answered he.

Hie on Pat! down the hill we go; crossing the icy brook in the hollow, over the fence, and we are in a thick slashing that covers about twenty acres on each side of a spring run; just the place for a few pheasants, but a little too close to a barn on the hillside above. Pat is ranging in a very handsome, stylish manner, keeping within gunshot, when, as I jumped from a fence he suddenly challenges; then roads cautiously forward, and comes to a point; the first on anything but prairie chickens since I owned him. He is standing at the edge of the thicket in front of a log heap, through which has struggled some thick undergrowth of hazel and elder. "To Ho-o-o, boy, be careful, now!" said I, when whir-r-r-r from the opposite side of the log heap rises a fine old cock pheasant; the gun is up in a twinkling, and bang goes the right barrel. Hang it all! too quick as usual, and bird not covered with the hit. However, he is cut down at from forty to fifty yards, but he is not killed; he falls into a wash-hole in the run, and is making the water fly with his thrashing wings. "Charge! Pat, you scoundrel! I'll cut the hide off you if you dare to stir," said I, as the dog evinced some uneasiness at hearing the wounded bird fluttering and floundering in the water. "Down! charge sir! I want no *Irish* charging here." Slipping in a couple of shells, and going up to Pat, and in a kind voice commending him for his handsome behavior, I went on to where the bird had fallen in the run. All about was feathers, but the bird was *non est*.

I finally found him away up under a log, which projected into the run, and from beneath which the water had washed the earth. I poked him out with a pole, and found him dying, piping blood from his throat. "A lung wound has fixed you, my poor bird," said I, and showing him to Pat, who smelt him, shook his head, and sneezed with delight and approval of the success, looked expectantly for my orders. I hied him on, and beat the remainder of the cover, and concluded we had secured the only specimen of *Fera Natura* it contained worth the sportsman's effort.

The sound of these shots had invigorated Optics, who braced up and started in my direction. In three-quarters of an hour, on taking the back-track, from the objection of a farmer, who was willing I should shoot rabbits and squirrels, but no quail or pheasant on his farm (and I here take occasion to say that I always respect the objection of a farmer, and have, as a rule, found them liberal in their courtesies to respectable sportsmen, and in this instance the objection was made upon the ground that he had promised to keep the birds undisturbed for a couple of friends of his own), I ran across Optics again, and we started together up a steep hill to take a view of the surrounding country, and select some place that promised shooting for the morning. When half-way up Optics gave out, and declared he would have to return to the house, as he couldn't keep up, and wouldn't spoil my sport by having me wait on him. With regrets I parted from him, and was soon over the hill out of view, changing my course now somewhat, as I heard and saw Corney a half mile away in the valley, running, yelling and cursing, throwing his arms wildly about in the air as he pursued Fagin, when he broke shot. Anon there would be two little puffs of smoke emitted from his gun, followed by the report of "double shots;" then would follow an indistinct scene of Fagin charging (?), dashing back and forth, leaping in the air, and Corney vociferously swearing and tearing after him—overtaking the unfortunate brute; then kicking, stamping, and pounding him, while poor Fagin's rolling, tumbling, retreating form, emitted dismal, piteous and heartrending yells, in fearful discord with the robust blasphemy of his infuriated master.

He is keeping that two hundred quail out of that field at immense cost of labor to himself, thought I, not to speak of the slight misunderstanding between poor Fagin and himself, and I turned my steps away to be out of ear-shot of the brutality, and struck for a corner of woods to my left, where there was an uncut buckwheat patch. As I entered, Pat, who was ranging rapidly down wind towards me, flushed a large bevy of quail with a whirr, and, startled, they came right at me, separating right and left as they passed. Pat dropped to wing, ashamed of what he had done, but sheepishly sniffed the air in the direction of where the birds rose, winking his eyes with becoming humility as I rated him. I had turned as they passed, and gave them both barrels, but in too great haste missed with my right, covering and cutting my bird down in a satisfactory manner with my left. Quickly recharging and bringing in the bird, I allowed Pat to smell it as an incentive to better behavior, and admonishing him, hied him on after taking him around to heel, in order to give him the wind of the birds I had marked down in the woods adjoining. Pat was now much excited, and had to be brought in once or twice for disobedience in ranging too far. Corney was now heard banging away, just at the foot of the hill, and bearing closer to me I was getting nervous, lest he should come up with me: then good good-bye to shooting in comfort, thought I.

"'Angels and ministers of grace defend' me from this evil spirit; this loud-mouthed desecrator of God's fair fields; this murderous pounder of an innocent, uneducated, and unfortunately ill-bred dog; this reckless prodigal of powder, shot and safety! defend me for one sweet half hour, now that I am in this very Eden of the sportsmen, and I shall do sacred homage to good St. Hubert!" Whirr-r! a stop is suddenly put to this soliloquy by the rising of a quail from beneath my very feet. I tumble him over at about thirty yards, and Pat crouches down for a moment at the sound of the gun. Having no time to lose I tell him to "hold up," and now begins as pretty work for the space of half an hour as it was ever my good fortune to enjoy. Point after point followed staunch and true in quick succession until they numbered eight, which yielded me eleven shots and seven birds to bag. Pat and I indulged in mutual admiration. When I knocked down a bird he, like a sensible dog, dropped to shot and grinned and sneezed in admiration when he struck a point staunch and true. I returned him many compliments, while he, with staid and solemn dignity, stood riveted to earth in a trance, magnetic, grand and beautiful—a feast to the eye and a stimulus to the heart.

It was now growing towards the middle of the afternoon, and Corney, hearing the reports of my gun, came up at last, his face red as a turkey-cock, and reeking with perspiration. Poor Fagin! the burrs all pounded off him, was now covered with yellow clay and loam; and skulked shy, lame and worn, to Corney's heel. Pat made for him at once, swelled with the pride of his recent success among the quail, and Corney punched him back with the muzzle of his cocked gun, which excited my apprehension to an unwonted degree. Finally, by accident, he punched poor Fagin instead, and this was considered by Pat a signal to go in, and he did, much to my horror and dismay. He had poor Fagin by the neck in a twinkling, and was rapidly wiping up that corner of the buckwheat patch with him, Corney punching them both with the muzzle of his cocked gun, varying it with reversing the gun and chopping at them with the butt. The air was thick with the now hoarse curses of Corney, the piteous cries of Fagin, and the victorious and savage growls of Pat, as he shook his unfortunate victim. The uncertain movements of the infuriated Corney and the liability of his gun to go off any moment, kept me dancing a *chasé* back and forth to keep its muzzle directed from me.

At length he punched them apart, and aiming a tremendous parting kick at Pat, accompanied by a fearful oath, he missed the dog and lost his footing at once; his heels flying in the air, he fell heavily on his back, stunned; his gun flew from his hands, striking the ground, both barrels going off, fortunately for me, in an opposite direction. Gasping for his breath I helped him up, and Pat coming near, the sight of the dog revived him, and he kicked then to some purpose. Knocking the breath out of my dog, he tried to jump on him, but I pushed him back.

After this excitement had subsided and Corney had, at my request, refrained from recharging his gun—and to encourage him in this I took my own charges out, but slipped them in shortly after—I assured him it was time to go home, as the birds were all hopelessly scattered. I then asked Corney what success he had met with down in the creek bottom.

"Oh," said he, "I killed more nor a dozen down there, but can find none of thim. I think it's becos Fagin got himself overhated and couldn't smell thim."

"I heard you making it hot for him down there, and supposed that would be the result. We'll go to the house that way, and see if Pat can pick them up for you."

He showed me just where he had stood and blazed away at them and killed his birds dead, and just where he saw them fall, but not a feather could be found. He comforted himself by assuring me that "them quails were the buggers to hide away," and said he'd often known them to run a mile or more after they were knocked down.

Returning to the house I found Optics much improved by his rest, and much pleased at my success and the good account I was able to give of Pat's behavior on this his trial hunt; and although I regarded the bag as rather slim, he declared it was more than fair under the circumstances.

However, the object of my winter holiday was accomplished in so far as testing the qualities of my new dog was concerned, and moreover, had I not been regaled with some novel hints and observations upon dog handling, etc., etc., that were valuable to—avoid?

But by no means had I afforded the sport I desired for my valued and genial friend Optics, but may the fates kindly decree us another opportunity when we are both in trim to hie ourselves away to the pleasant fields in autumn, where with staunch and well-tried brace of setters and plenty of birds, spend the swiftly, yea, too swiftly, passing hours of a bright October day, amid the thrilling scenes of pointing dogs and rising quail, and the soul-enchanting music of the booming and reverberating guns.

SOUTH FORK.

AMONG THE PINES.

IT is incredible to suppose that a jolly party in search of sport and adventure, knowing of a chain of beautiful lakes, abounding with fish and fowl, could long resist the temptation of a few days' sport upon their attractive shores. We certainly could not, and after a hurried preparation were off. "Nine precious souls, and all agog to dash through thick and thin." The complete pleasure of an excursion of this kind is somewhat marred unless you have congenial companions, and in this respect we were particularly fortunate. Our party consisted of several young southerners full of fun, a young English sportsman fresh from the "tight little isle" (entirely unacquainted with the ways of American youth), and an experienced hunter, who was thoroughly imbued with frontier customs and manners and an excellent hand to "rough it" on occasions like this. At early dawn we drove out of one of the most picturesque villages in the St. Croix Valley, if not in Minnesota; and an interesting drive of several hours through dense forests of pine and lonely tamarack swamps brought us to the shores of Forest Lake; the first and most beautiful of the chain. Among the numerous lakes we have visited this one seemed especially interesting, situated as it is in the heart of a dense forest in the wilds of the Northwest. We have spent hours in silent contemplation of the moonlit charms of Italy's twin jewels, Como and Sugano; caught our first view of Geneva, the mirror of the Alps, as we came from the frozen passes of the Simplon; and have studied the beauties of the Irish and Scottish chains from every point; but bright and beautiful as they all are, they failed to impress us as did this obscure lake in the wilderness. In the former, the practical demands of civilization destroy all sentiment. The shrill whistle of a locomotive or the "wash" of a passing steamboat awakens the poet from his dream, and reminds the student of nature that the glorious bliss of seclusion and solitude is not to be found there. But on the banks of this northern lake one would suppose the sound of a human voice had never been heard, so intensely impressive is the silence; a fit place "To dream o'er the buried past, enjoy the living present, and build such lofty and enchanting air-castles for the glorious future." Here the deer is still master of the forest; the fish as plenty and as unsophisticated as the aborigines in the days of Columbus; while the speckled beauties have a "high old time" in the many sparkling brooks that leap and tumble through these dense shades. In many places the beach is quite wide, mostly of firm, clear, white sand, with a liberal sprinkling of cornelians, while at intervals tiny dikes of boulders reach to the water's edge. A few glances of admiration and exclamations of delight, and all turned their attention to pitching camp and preparing for the night. The staunch batteaux, which served for wagon-bed and parlor car during the day, was successfully launched; horses properly cared for, and every one in good spirits in anticipation of sport or adventure. The first thing to be accomplished was to obtain fish for supper, which the entire camp readily volunteered to do; but we concluded that we could only spare a couple for that pleasure, as there was plenty of work in camp for the others. How natural it is for every one the moment they go into camp to start off directly on a fish or hunt, expecting the others to pitch tents, do the cooking, etc., etc. Those of our party who were so inclined were unanimously selected as a returning board, with power to investigate the fish question and scale, clean and count in a suitable mess for supper—while one rare youth, who had already started into the brush with gun at right shoulder, was recalled, and promptly made chairman of the fish committee. He modestly declined the honor in a suitable speech, but at last yielded to the urgent solicitations of the entire camp. It seemed wicked to catch more fish than we needed—but soon after supper, while the pipes were being relit for the second or third time, an incident occurred which aroused the camp as well as keeping the fish from spoiling on our hands. This was the unexpected arrival of several aborigines of the Chippeway family, who had been gathering cranberries in the swamps and were en route to the river settlements to dispose of them. They were a hungry and noisy set of "varmints," and a Turkish bath would have wiped them out of existence, as they were the most unclean rascals we ever saw by a large majority. Some of our fellows had never seen an uncivilized Indian before—especially our English friend, who, upon being assured that his auburn locks would not be appropriated for ornamental purposes, made their acquaintance and begged them to "stop and sup a bit." The invitation of our hospitable friend was not in vain, judging from the manner in which everything eatable upon the premises disappeared. After having grunted their satisfaction they produced pipes, and helping themselves to our tobacco, intimated by idiotic gestures their intention of remaining and "making a night of it" with us—which by a strict party vote was seconded, as their arrival in our camp was as welcome as a stern-wheel circus in a country village. We cannot relate the many incidents of the night, but it is sufficient to say that story, song, and yell was in order until early in the following morn—when by sharp attention it was ascertained that a not far distant timber-wolf could now and then get a howl in. Then we slept—or tried to sleep—but some of our younger boys were up to all manner of mischief—much to the discomfiture of our Englishman and to the annoyance of others. Early the next morning our guests, the "Chips," silently stole away, taking with them a few things which were handy (as mementoes we suppose)—a way they have of expressing their gratitude, and a way not exclusively confined to them—judging from the well-filled prisons everywhere. After breakfast we packed some supplies into our boat, and leaving four of our fellows in camp who preferred still fishing near by, we started for a tour of the lakes. The scene up the lake that morning was sublime, and had a decidedly refreshing effect upon our party. The wind was just rising, and the dark green waves were tumbling about and chasing each other up the clear sandy beach at our feet. We improvised a rude sail, which improved and accelerated our speed, and we soon approached a gem of an island—upon which we landed, where a rest and some still-fishing was indulged in. Our English companion buried himself in geological research, and returned to the boat with a peck or more of what he thought were cornelians, but which proved to be common pebbles, and upon being informed of this he was "bloody mad" for a while, which was decidedly English. To have joined in the laugh would have been Yankee to the backbone. As we proceeded up the lake the shores drew together, and presently we entered what proved to be a thicket of lilies and wild rice. As we passed further into it, hundreds of duck rose at every dip of the oars, and we had good shooting for some time in that locality. We forced a passage for some distance through these fields of rice—the heavily laden grain nodding and bowing with every passing breeze. Wild fowl who attend these rich feasts furnished by the liberal hand of nature soon become so fat that they can barely fly. In feeding they incline their heads horizontal with the water, and with their bills saw asunder the stalk until it falls, when they can leisurely and easily get at the kernels. After passing through this thicket we entered Boot Lake, the second of the chain—and a charming sheet of water it is—a few miles in circumference. Selecting a suitable place for camp, we landed, spending the balance of the day in shooting and fishing. We found some fine bass in this lake, but too many pickerel, although good weight and very palatable. Having left our tents at our previous camp we slept in our blankets, and soundly enough, notwithstanding a complimentary serenade tendered us by a strolling band of wolves and mosquitoes. We arose, bathed, breakfasted, and were afloat just as the beams of old Sol were dancing on the water. On our return trip we saw several canoes in a well-sheltered cove, and nearly as many Indians, who asked us for tobacco and other things. They seem to be eternally hunting something to eat, the one object of an Indian's life from the cradle to the grave. In the distance, romance pictured the young maiden sitting near the water's edge as Longfellow's "Minnehaha," in the days when the dusky Indian roamed the forest in his native pride, when the only sound of life upon the northern waters was the scream of the affrighted loon, or the muffled dip of the paddle as some solitary Romeo returned to his camp after a stolen interview with his dusky Julict. We confess we allowed our fancy to quite carry us back into the dim past, and we were dreaming with Cooper and Longfellow until we were disturbed by the shrill cries of the vagabonds on shore for anything and everything. Upon a closer inspection the maiden did not resemble the beautiful creature which history pictures and art portrays as welcoming our ancestors to the shores of America. A brief stop, a last farewell to Minnehaha and her tribe, and we were off, homeward bound. More anon.

ANDREW JACKSON FOSTER, THE MEGANTIC GUIDE.

WHO has visited Lake Megantic during the last fourteen years without meeting or *hearing* of old Foster? It is unnecessary to say from whence he came, his name sufficiently establishes his nationality. He held a position as scout or pioneer in a New England regiment during the late "unpleasantness," but as the job didn't suit him he quietly "dropped out," and took up his quarters at Megantic, and with his wife and daughter occupied a log shanty at the outlet of Rush Lake, near the junction of the Arnold and Spider Rivers, where by hunting and trapping he always managed to pick up a decent living—of the kind. We first met him some twelve years ago, when, after a hard pull of some fifteen

miles from the settlement at the foot of Lake Megantic, we reached the "Foster House."

Our party consisted of Borlase (now a prominent Montreal barrister), Captain Winder (now Inspector of the Manitoba Mounted Police), and myself. The Captain had been there the previous summer, and rather excited my imaginations by dwelling upon the charms of Mrs F., whom he termed "a delicately-nurtured lady of very prepossessing exterior, and fit to adorn the most prominent walks in first-class society. And still, boys, although a lady by birth and education, she takes to this wild life as naturally as a duck to water." The charm was rudely broken when, on sighting the shanty, we beheld Mrs. F. squatted on a log, scantily attired, enjoying the stump of a very black and dirty looking clay pipe, while "Darwin's missing link," seated close by, clad in hermaphrodites apparel, was introduced to me as Miss F., familiarly called Lois. However, what the old woman lacked in beauty she made up in hospitality, and we were soon enjoying a hearty supper of fried pork, bread, and tea, with a smoking mess of new potatoes, for the old woman maintained her *ethnm cum dogin taters*, and had quite a patch of the fruit back of the shanty. Borlase furnished some lemons, and we had a hot punch to assist digestion.

Foster was off at John Pope's gold mine, several miles distant, and filed an appearance about nine o'clock. He had a bag of trout, caught in the Annance River as he came along, for which we gave him $1.50, and which when packed filled a sixty-pound butter firkin. We had a letter to deliver from my friend Brooks, engaging Foster to meet his party a day or two later, and as the old man expressed his inability to read writing readily the Captain deciphered it to suit the occasion, and we had him engaged do our bidding for $1.50 *per diem* and found.

Next morning we started for the Spider Lake, where we found Foster a birch bark, which he and myself took possession of, while the rest of the party occupied an old punt which had been left there. What sport we had trolling for bass in the lake and fly-fishing for trout in the Upper River! But our commissaries gave out, and next day we had to send Foster back to the shanty. He returned toward evening evidently in possession of some of the ingredients of which that punch was manufactured, and informed us that a messenger had arrived requiring his presence to meet Brook's party next day, and he must start that night to get through. "But," said he, "come ashore, boys, whar them ere white birches is, and I'll map out the course so you can git along just as well 'thout me. Say, let's have that jug. Now, boys, ye're just the best, decentest fellers I ever went with, and I'll be darned of I don't wish I could stay, but Mr. Brooks has obleeged me, and I've got to obleege him. Now, just lookee here and I'll map your course. Just keep along the river here, just where I've made this black line, till you git here to a spruce tree with a chip out'n it that I tuk out for a muk trap, then hitch up your boat, and when you git atop the bank ye'll see a blaze, foller it about'er mile and it'll take you to the falls, and I tell yer, boys, of ye don't git all the trout ye can lug, I shan't tax ye a cent for my services; jist foller my instructions. Gosh, boys! it's dry work mapping. Here's luck! Ye're jist the best fellers I ever see, and I'd like to stay but I can't; jist follow my instructions and ye'll git along 'dzactly as well 'thout me."

So after one or two more *primings*, being about that time *full-cocked*, he went off. We watched him as in his little birch he laid out a line for a Virginia fence, and with gloomy forebodings of ever reaching the falls by following his instructions, we started, and fortunately got through all right. Well, it's no use talking, but if you want all the trout you care about, running from a quarter to a pound weight, try above those falls late in July and you'll get them. Near the outlet of the upper river in the still deep water the trout run larger. The Patriarch and myself one September took out seventy-four in less than two hours, weighing over seventy-five pounds, and this with fly, remember. Several weighed four to four and a half pounds each. After a day's fishing on the falls we decided to make our way back to Foster, and had nearly reached the shanty when a terrific thunder-storm came up, completely drenching us. We got to camp, and *for fear of cold* we all partook of a good stiff hooker of "old rye" before changing our clothes. Mrs. F. and Lois had adjourned to the "lean to," and the old rye reminded the Captain of a story which somewhat delayed his changing. He had got his under-shirt nicely over his shoulders when the old woman, thinking she had given time enough, stepped in and went about her work quite unconcernedly. The Captain finished putting on his dry clothes, and then remarked.

"I believe I owe you an apology, Mrs. Foster; I ought to have told you I intended changing my clothes."

"Never mind, Captain, never mind."

Since then I have frequently had Foster as guide and boatman, and in either capacity have never met a better man. His cooking is somewhat primitive in style; so that part of the business hadn't better be entrusted to him. That isn't his *forte*, but take him five or six miles in the woods, and if you want a bee line made to any particular point, Foster's your man. One day he left us at Trout Pond, between four and five miles from Megantic Lake, at 1:30 P. M., traveled that distance on a blazed line, rowed three miles further to where our supplies were, broke an oar, made a new one with his axe, packed a swag, and was back in camp at eight o'clock.

"I guess," said he, "I didn't lose much time, broke my oar at Arnold's River, and here I am. What's the time, boys? Pretty quick work! I felt kinder wilted down thar at the fut of the hill and tuk a swaller out'n the jug, and that kinder helped me."

The old chap wanted to play "just eleven games euchre for fun," but as he had to keep telling about "breaking his oar at the mouth of Arnold's River," we never finished the first game.

The last time I met Foster was three years ago last September, when he and I arranged to follow Arnold's route from Lake Megantic to Quebec. We started early one morning in a small clapboard built boat, but before we had got more than fifteen miles we stuck in a *chute*, and that boat was *non est* in a jiffy. We saved an axe, gun, and a box of fishing-rods, and after an all-day tramp through the woods struck a road, and reached the settlement about midnight. Foster has ceased to abide at Megantic, but every fall he works his way up from Vermont and spends a couple of months trapping in the vicinity. He was there last fall, but I didn't happen to run across him. Should any of your readers visit Lake Megantic let him get Foster as a guide if he happens to be there. He knows more of the hunting and fishing game than any man I have ever met with, and is tougher than shoe leather. He never tires out. His "particular vanity" is pickles. Don't leave any round loose. As Mrs. F. said when our stock of pickles disappeared: "If there's one thing more than 'nother that I admire Andrew Jackson for, it's because he's honest; but he did eat them pickles. He said you told him to take jest what he'd a fancy for, and he fancied them pickles." The pickles were put up in Worcestershire Sauce, and I presume were a little ahead of anything he had been used to. D. THOMAS.

Sherbrook, P. Q., March 5, 1877.

SPORTING UNDER DIFFICULTIES.

REMINISCENCE OF THE SEMINOLE WAR.

LAST winter, when in Florida, after our day's sport we used to sit around Aiken's cheerful log-fire at night and listen to his Indian stories, until at times we almost expected to see the door open and the shade of Billy Bowlegs enter. Aiken himself was not unlike an Indian, with his long black hair and swarthy complexion, though he certainly would not have esteemed it a compliment to be told it, as he had a thorough contempt and hatred for the whole race. I shall endeavor to give you one of his adventures as nearly as possible in his vernacular. I believe it to be literally true, as he was very modest about speaking of himself:

"It was during the last Injun war; I was one of the cowboys, as they called us, who undertook to fight Billy Bowlegs. I was shut up in Fort Dunn, down near the Kissimmee, along with a lot of soldiers and crackers, and there we had been some time waiting for orders. The Injuns was all about through the country and we didn't keer to venture fur from the fort. I got mighty tired of staying in there eating hardtack when I knew there was plenty of fish and game outside. There was a creek only about a mile away chuck full of trout, and I come to the conlusion one day I couldn't stand it no longer, so I says, 'Boys' I says, 'I've a good mind to go over to the creek and catch me a bait of fish; we can be keerful, and if the Injuns comes can make tracks for the fort.' Well, we talked it over and three of us concluded to try it, so we took our guns and fishin' lines and started. We got about half way, going along very cautious, when we come across some fresh tracks of Injuns made that very morning, and we knowed they couldn't be far off. When the others see these signs they stopped and wouldn't go no further; said they didn't keer so much about fishing, and nothing would do but they must go back. But I had fixed to have some fish and I kept on to the creek. I got there all safe, and fixin' my line commenced fishing. The trouts was pretty hungry, and I soon had three or four big ones laying out on the grass, and was beginning to think about turning back, when bang goes a gun about a quarter of a mile away, and I had just time to jump behind a big tree and get my old rifle ready when out run a wounded deer from the hammock and made for the creek. He was badly hurt, and just as he reached the bank staggered and fell, not thirty yards away, on the other side. I stood still poking my eye round the tree and not daring to move, for I knowed they'd be after him; and sure enough in a minute or two there come two Injuns running along on the trail like hounds. They saw the deer and went up to it, and looking all around to see if there was anybody about, one of them stooped down and commenced taking the insides out of the deer, while the other stood up to keep watch with his gun ready. I didn't believe the Injun was born that was to take my scalp, but I made myself right small behind that tree, just peeping round at him, when all at once one of the fish I had caught flopped up on the bank and caught the Injun's eye.

"'Now,' thinks I, 'old fellow, I must kill you,' and I just raised my gun and shot him through the stomach. 'Wagh,' he says, and fell over on his face dead, and that other Injun just raised hisself and run off stooping down, without ever stopping to see what was coming next. I didn't stop, but cleared out for the fort, and when I got most there met some of the boys on horses coming to look for me. They had heard the shooting at the fort. We went back to where I had been fishin' and followed the trail of the Injun who had run, until we got to where they had had their camp, but they had left, so we come back and got the scalp of the dead Injun, and the deer and fish, and carried 'em back to the fort, and that night we had fish and deer meat for supper. Speaking of supper, I thought I heard Norah call a minute ago; I reckon its ready. Anyhow, come walk out Cap, you and Doc Cloy. I know you must be hungry after catching them big fish this evening. They ought to eat well to-night."

They "eat" well and so did we, and as we rashly "turned in" immediately after supper I dreamed all night that I was catching a big fish and an "Injun" was trying to take my scalp and cut up a deer at the same time. E. S.

THE GREAT SUSPENSION BRIDGE.—The work on the Brooklyn suspension bridge commenced on Jan. 2, 1870. There were $500,000 subscribed by private stockholders, $3,000,000 by the city of Brooklyn, and $1,500,000, by the city of New York. Of the private subscriptions $340,800 were paid in, but this was returned with interest to the stockholders last year on the assumption of the work by the two cities. The act of the Legislature now requires the bridge to be finished by a joint subscription of New York and Brooklyn, in the proportion from each of the original contribution, the latter to pay twice the amount of the former. The cost of the bridge is given at nine millions, besides the acquisition of land; the latter is estimated at three and a half millions. We put together a few items concerning this bridge:

Construction commenced Jan. 2, 1870; length of river span, 1,595 feet 6 inches; length of each land span, 930 feet (1,860 feet); length of Brooklyn approach, 971 feet; length of New York approach, 1,562 feet 6 inches; total length of bridge, 5,989 feet; width of bridge, 85 feet; number of cables, 4; diameter of each cable, 15½ inches; each cable consists of 6,300 parallel (not twisted) steel wires, No. 7-gauge, closely wrapped to solid cylinder; ultimate strength of each cable, 11,200 tons; depth of tower foundation below high-water, Brooklyn, 45 feet; depth of tower below high-water, New York, 78 feet; size of towers at high-water line, 140x59 feet; size of towers at roof course, 136x53 feet; total height of towers above high-water, 277 feet; clear height of bridge in centre of river span above high-water, at 50 deg. Fahr., 135 feet; height of floor at towers above high-water, 110 feet 3 inches; grade of roadway, 3½ feet in 100 feet; size of anchorages at base, 129x119 feet; size of anchorages at top, 117x104 feet; weight of each anchor plate, 23 tons; total cost of bridge, exclusive of land acquisition, $9,000,000; cost of land, say $3,500,000.—*Sunday News.*

—A well-spent life is a man's greatest claim on happiness. There could be no better spent life than that which has produced the finest soaps in the market, and now gives to the world that nonpareil, B. T. Babbitt's Toilet Soap. We speak of this matter because this toilet soap is so pure and delicious a household article.—*Adv.*

Fish Culture.

THE IMPREGNATION OF SALMON EGGS.

WE have received from Prof. Baird, of the Smithsonian Institution, the following translations of interesting articles by Von Haack, Director of the German fishery establishment at Huningue, which have just been transmitted from Germany:

The losses, frequently incredible, which, during the first years of my being actively engaged here, resulted in the case of impregnated eggs sent me from abroad (losses of 50 per cent. by no means were of rare occasion, nay, they were often much greater), compelled me to apply another method of inpregnation than that hitherto resorted to, namely, the eggs were emptied into a vessel containing water to the height of two or three fingers, and hereupon the milt of the male poured out into the vessel over the eggs, the whole then stirred about with the hand, left to stand quiet for some minutes, and the fluid then emptied out, and thereupon clean water poured in so long until no turbidness was to be seen.

This method of impregnation, surely the most natural one and the one most frequently applied, affords no matter for hesitation if properly managed, and will yield good results, provided the milt is put into the water as quickly as possible and spread over the eggs. This method of impregnation is particularly successful with stream-trout, these smaller fish being easier to handle.

Whoever has been present, however, once at an impregnation of salmon or sea trout eggs, and sees what a length of time elapses, even with the greatest diligence, before a serviceable male is found and caught, will find that with these larger kinds of fish impregnation cannot proceed with that celerity as it does in the case of small fish. In the first instance, the removal of the eggs with a large fish. The taking away of the eggs lasts longer, the fish must be carefully handled, as it has to be preserved further in a live state, must therefore also first be taken back into the reservoir before the respective male can be made use of. From the middle of spawning time you have often to put back three to four males as having already spawned, therefore unfit for use, until a fit male be found; this applies principally to heavy sea trout, often weighing 40 pounds. Several minutes elapses as a rule, before the milt of the male comes in contact with the eggs first emptied out, and in consequence of this, a great part (in unfavorable cases the most) of the eggs remain unimpregnated.

The egg, as is known, as soon as it is put into the water, begins sucking in water, and the egg can principally only be impregnated during the time of suction. If, therefore, the milt only gets into the water, when the suction of the egg has already finished, the sperm no longer penetrate into the egg; no impregnation therefore takes place. These light-colored or glassy, germless eggs (known to all old fish-breeders), in the case of slight contact become immediately white and opaque; the water which is between the coatings of the egg penetrates into the white of the egg and causes this to curdle, while the set eggs, even if touched more strongly, sustain no damage.

Here I cannot refrain from reverting to a thoroughly inaccurate observation of the Norwegian fish-breeder, Mr. Hetting, whosupplied some very practical directions some time ago in the circulars of the society for hatching-troughs, etc. Mr. Hetting asserted on that occasion that the bright eggs, as soon as they were brought into a stronger current, showed a distinct fresh development to germinate, but that the germ disappeared again as soon as the eggs returned into sluggishly flowing water. It is impossible that Mr. Hetting in his observations can have used a microscope, or even a good magnifying glass, otherwise he would know that there can be no question of any formation of germ whatever; the germ once existing may perhaps remain behind, i. e., die, never, however, disappear again. But of this on another occasion. Hereupon, as the method mentioned had only led to bad results with all larger fish, I let the eggs be impregnated in such a manner that first of all some milt was put into the water, and only then the eggs were placed into the water impregnated with milt, whereupon some milt was added. This method also only produced bad results in all cases, when the operation of impregnation proceeded slowly, owing to the above-mentioned cases.

Neither did the "dry impregnation" frequently alluded to in the circulars of the association yield the desired results, inasmuch as the bringing together of the milt with the eggs would not always be sufficiently speedily effected, because the fishermen dealing with the requisite quantities of water into which the milt was previously to be placed could not be sufficiently superintended and controlled. In the case of clumsy handling, I have met with utter failures just with this kind of impregnation; probably because the fishermen delayed too long, so that the sperm had therefore already died, and were no longer movable.

Hereupon I altered the above method in the following simple manner, and since then these bright eggs scarcely ever occur: The eggs of the fish are placed into an empty vessel, with smaller fishes; I even take three to four females after one another; upon this, without any precipitation, one or two males are taken, and the milt put over the eggs, stirred round with the hand, and then some water quickly added, generally bailed with the hand, and then again stirred with the hand. The eggs having stood quiet for about two minutes, are also drained off clean. Any mistake or blunder can scarcely be made with this method, and the success is so certain a one that even 5 per cent. of unimpregnated eggs must be considered as a bad result; generally the loss is almost none at all. The reason which led us to this kind of impregnation are the following: I was aware that by adding some alkaline fluid, the sperm, already motionless, could again be made movable. I had further found that the belly-fluid of the fish, which escapes at the same time with the eggs, has a weak alkalic action. If lay close at hand, then, in the first instance to pour the milt into the reacting alkalic fluid, and after that the water over the mixture. The sperm, up to the commencement of the suction of the eggs, are thoroughly lively in their motions, and therefore along with the water sucked in penetrate into the egg and impregnate

it. The careful draining off after this I have retained, because I fear that with the continued suction of the eggs perchance, motionless might be carried along into the egg, and a disturbance hereby be produced. Whether my apprehension be with foundation, I have not hitherto been able to observe.

I crave your indulgence if I have been somewhat explicit, but just the impregnation appeared to me to be so important as the fundamental part of the so-called artifical breeding, that it could scarcely be treated of exhaustively enough. I am firmly convinced that every one who once tries the method of impregnation taken by myself, will never again apply any other.

VI.

ON THE SETTING AND HATCHING OF COREGONUS EGGS.

Already during the French administration or management, attempts were made almost every year with the setting and hatching of *Coregonus fera*, with so little success, however, that of late the hatching of these eggs was entirely given up, and they were simply despatched impregnated. The attempts undertaken by myself also produced almost always a negative result, at least the arrangements never stood in a right proportion to the expenses thereby incurred. As I had, however, nearly finished in this year the transformation of our local institution from a mere hatching-place for *Coregonus* into a breeding-place for almost all fresh-water fishes of Middle Europe, and therefore had more leisure to closer observations and experiments, I undertook (being instigated to do so by an inquiry of the meritorious President of the German Fisheries Society) this experiment once more. Hitherto people had proceeded with the setting of the ova, especially of *Coregonus* and *Wartmanni fera* always in similar manner as with the salmon tribe, therefore salmon and trout, namely, in rather strongly running water.

As, however, with the small eggs of the *Coregonus*, the most dangerous enemy of the eggs, the byssus, appears much more vigorously than with the eggs of salmon and trout; the spoilt eggs, however, owing to their small size being much more difficult to remove, the whole brood was almost always lost, most likely principally caused by the confervoid germ moving in with rapidly flowing water, and setting themselves on the eggs not yet impregnated, and infecting them. I now tried to carry on the setting in almost quite standing-water. The change of water was so slight that any real current was scarcely perceptible, and the success was a surprising one. Notwithstanding the circumstance that very many of the eggs used for this purpose were spoilt on their arrival (the eggs had stood for about 36 hours in a heated Custom House office), I succeeded by means of small pincers, especially made for this purpose, in removing the damaged eggs, a formation of fungus in such quantities did not take place in the almost standing-water, at least it was not so great that it could not be removed without difficulty. After the eggs were once set, a real actual loss did not occur, so that almost without trouble I have hatched 80,000 young.

This experiment with the eggs of *Coregonus* has an importance not to be underrated, as the opportunity is afforded here to transplant valuable *Coregonus* in such lakes as appear adapted for it, and as the arrangements for hatching can be effected everywhere without entailing considerable expense.

The eggs of *Coregonus* and *Wartmanni fera* are to be had in almost unlimited quantities. Our local institution will, it is expected, be able to supply the set eggs at 2 marks the 1,000 during the next hatching season, later on perhaps cheaper. What with the trifling consumption of water, the proprietor of such lakes as already contain *Coregonus*, or appear suited for them, and which do not command a water-course with sufficient fall, can construct a hatching-place for *Coregonus*, without serious cost of maintenance. A simple hand-pump, set going morning and evening for a half hour each time, supplies water enough to feed a small reservoir (the cheapest would be several well-cleaned petroleum casks joined by tubes), which suffices amply for twelve hours, as the consumption of water should be so light. Then again, as the little embryos immediately on slipping out are very movable, and swim about merrily, they may be placed already a few days after slipping out without any fear that too large a number of them perish. The struggle for existence of course is not spared also to these little fish, nevertheless a stock of them may at any rate soon be established. As in many lakes, the *Coregonus* must be caught during spawning time, as they cannot be taken at other times of the year. The transfer (also as regard these valuable fishes, what with their considerable prolific qualities especially) from one lake to another may be undertaken in the most productive manner, and without heavy expense and much trouble.

Berlin, February 23, 1877.

FISH CULTURE IN NORTH CAROLINA.—The Legislature of North Carolina has passed an act constituting a "Department of Agriculture, Immigration and Statistics," to be under the supervision of a Board comprising the Governor, State Geologist and others, one of whose duties will be to increase the fish products of the State. It is especially interested with "the supervision of all measures for the protection, propagation and culture of fish in the rivers and other inland waters of this State, and to this end they shall at once provide for stocking all available waters of the State with the most approved breeds of fishes, and shall avail themselves of such aid as the Fish Commission of the United States may be induced to extend, and they shall inquire into and report upon the practicability of constructing fish-ways over dams and other obstructions in the waters of the State, and secure as far practicable the co operation of mill-owners; they shall select proper locations for the hatching and care of the young fish, and shall provide the necessary hatching houses and such appliances as may be needed, and employ such labor as may be necessary to this end, and they may appoint agents at such convenient points to aid them in the distribution and hatching and protection of the ova and young fish; provided such agents shall receive no compensation.

"They shall transmit to the General Assembly at each session a report of the operations of the said department, together with suggestions of such legislation as may be needful, and it shall be the duty of the Board to prosecute all offenders against the laws which have been, or may be, passed in this behalf, and they shall endeavor to secure the co-operation of adjoining States to remove obstructions in the passage of fish in those rivers or streams which are partly in this State and partly in such adjoining States."

Natural History.

SOMETHING ABOUT BIRDS OF CENTRAL NEW YORK.

BY J. P. HUTCHINS.,

NOW that spring is at hand, let lovers of birds be on the watch for the numerous migrating warblers that will soon pass us. It is only for a few days in early spring, when nature begins to wake from her long, cold slumber, that we can see these little messengers of warmth. They flit by us like phantoms, as it were, and while we seem to catch but a gleam of their bright plumage as it sparkles in our tardy sunlight, they are gone, leaving only the sound of their sweet warble ringing in our ears, like the distant chime of some tiny bells. Watch, therefore, lest these flitting joys escape you.

These migrants pass in May. Small and sprightly they skip among the tree-tops and thick evergreen foliage, feeding on the early insects as they go. Those who would see them should extend their morning walks to the nearest grove or wood, and spend an hour each warm day in watching and listening.

Birds seem not to take very kindly to our Central New York climate, especially the smaller forest birds. Nearly all of the warblers leave us in—well, not altogether our glory, if our peculiar weather be reckoned in—and go further east, or north even, to spend the summer and rear their young. Long, cold rains, are destructive to the nests and eggs of small birds. In June I noticed a Goldfinch (*Chrysomitris tristis*) building her nest in a maple on the lawn. A cold wind and storm came, which continued for a week, and blew away this partly finished nest entirely; but when the sun came out and nature smiled again, the absent toiler came back, and my faith grew apace, to see how stoutly the little creature set about building a new nest in the same place where the first one was destroyed. This time it reared its young, while its mate whispered his sweet refrain to every passer-by, during the many warm summer days that followed. I noticed in this case that the male bird did not assist in the building of this nest.

There are several kinds of birds which, though seldom or never seen in our Oneida Creek Valley, are common in the hills that range along each side of it. We might infer from this fact that these birds generally resort to the hills in preference to the valleys, if it were not that the same birds, in kind, are found about the shores of Oneida Lake, which lies a little north, and still lower than our valley. However this may be, when I would collect certain specimens and hear our finest songsters, I get away to the hills and into the heart of some bit of primeval forest, still spared from the woodman's axe. So there, in the middle of May, the Rose-breasted Grosbeak (*Goniaphea ludoviciana*) will perch above my path, and deliver himself most wonderfully; the saucy fellow seems to know that I don't care to "collect" him, so continues to wake the slumbering echoes of the old wood with his liquid song as long as I will listen to him. But he is a charming, noisy bird, so I soon get away from him to another part of the forest, where, if not beset by another of his kind, I can hear the delicate warble of the *Sylvicolidæ*, other little migrants of which I am in search. A few day's later, when the Grosbeak has ceased to sing, the Scarlet Tanager (*Pyranga rubra*) begins his melodious discourse from the arm of some giant elm. The manner of his song is a kind of imitation of that of the former, but not so strong and pure. Then follows the Wood Thrush (*Turdus mustelinus*), the sweetest songster of the forest. Indeed, the quality of this bird's song is hardly equalled in bird melody. Its tender notes seem to wake the spirit of the wood; the young leaves are stirred by æolian strains, wafted from sylvan depths, that appeal more to the soul than to the ear of the listener. In May, this bird sometimes visits our valley for a short time, and has even been heard in the orchards, but I have found only one nest here in twenty-five years; its home is on the hills, and it requires the deep, resonant forest to render the full charm of its song. The Grosbeak and Tanager, above mentioned, are very rarely seen in the valley, where I have never found the nest of either.

My late friend, Dr. Latre, was a keen lover of music. He played a musical instrument with a masterly hand. But he was also a keen lover of the simple melodies and harmonies of nature. He would travel on foot for miles to catch a few strains from some bird that he wished to hear. Indeed, he expressed less enthusiasm at a musical performance by Ole Bull that we once witnessed together, than I have sometimes heard him at the simple song of the Thrush. Oh, his was a rare soul for nature, and the mighty Creator of it!

Below is a list of birds taken on their passage in 1876. They are all non-resident in this locality, as far as my observation extends. The accompanying dates denote the time when they were taken:

November 7.—*Centurus carolinus.* Red-bellied woodpecker—a fine, large bird. Have never seen but two here, both of which were taken on the hills.

October 10.—*Sphyrapicus varius.* Yellow-bellied woodpecker. Have taken only two here.

May 16.—*Dendræca cærulescens.* Black-throated blue warbler; quite rare. Very few are seen during the migration seasons.

May 23.—*Dendræca Blackburniæ.* This beautiful little warbler is also very rare.

May 18.—*Parula Americana.* Blue yellow-backed warbler; quite common when migrating.

May 24.—*Deudræca castanea.*—Bay-breasted warbler; rare. Have taken but one.

May 26.—*Myiodiactes canadensis.* Canadian fly-catcher; not common.

May 3.—*Regulus satrapa.* Golden-crowned kinglit; very abundant while migrating.

Pinicola enucleator.—Pine grosbeak; taken in winter. Very rare.

May 12.—*Sitta canadensis.* Red-bellied nut-hatch; a rare little straggler. Taken in the forest, scrambling among the pine cones.

May 9.—*Dendræca virens.* Black-throated green warbler; quite common.

November 6.—*Spizella monticola.* Tree sparrow; common in winter.

Collurio borealis. Great northern shrike; seen frequently in fall.

May 23.—*Dendræca striata.* Black-polled warbler; a common migrant.

May 23.—*Mniotilta varia.* Black and white creeper; rare.

Vireo flavifrons. Yellow-throated verio. Taken in May.

May 9.—*Dendræca coronata.* Yellow-rumped warbler. Our most common migrant.

September 26.—*Anorthura troglodytes.* Winter wren; common in fall.

Certhia familiaris. Brown creeper; common in fall.

May 16.—*Dendræca cærulea.* Cœrulian warbler; very rare: Was taken on the hills.

HOW EAGLES AND FISH-HAWKS FEED THE POOR IN FLORIDA.—A correspondent says:

"Passing the cabin of an old negro on the Spruce Creek, we were hailed by his daughter, who asked us for fish. It so happened that having none in the boat we were obliged to refuse; but just then an osprey was seen passing by with a large fish in his talons, pursued by an eagle. The fish-hawk was so closely pressed by his pursuer that he had to drop his prey, which fell close by the cabin, and was gladly picked up by the woman. Thus, although the birds lost their supper, the hungry negroes gained one, and as the man happened to be a preacher, he doubtless compared himself to the prophet who was fed by ravens."

—We have received from our friend Mr. Shelton, of Rahway, N. J., a beautiful specimen of an albino robin, which is an interesting addition to our collection. The bird is not completely white, having a black cap and a number of dark feathers in each wing and in the tail. One or two feathers of the throat are tinged with rust color, but with the above exceptions the specimen is pure white. The donor has our thanks for his kindness in sending us a specimen of so much interest.

A DOMESTICATED PENGUIN.

EDITOR FOREST AND STREAM.

It sometimes happens that an individual from the families of aquatic birds, distinguished for nothing but their open-throated voracity and their fear of the human species, rises above its nature and gives some evidences of civilization and the higher glimmerings of what may be called an intellectual instinct. The following remarkable circumstance, never before published, is in proof of this. It is strictly a fact within the knowledge of several living witnesses.

The whale-ship Hubbarston, of New Bedford (this may not have been the name of the ship, but that is immaterial), was cruising on the Brazil banks in 1847. The morning of May 20th had been a tediously laborious but successful one—it had brought a whale to his "death-flurry." The captured monarch of the deep had struggled bravely—lashed the sea into foam, which was stained with the crimson tide that flowed from the spear wounds; but it was death with which it grappled, and the monster, like a huge spoil of war, was towed alongside, and secured by the fluke chains to the ship. Grog was served, as customary on those triumphant occasions, and a part of the crew retired below to partake of the two delicacies of a whaleman's larder—bread and salt-junk. A person looking overboard saw a penguin (*Genus Aptenodytes*), commonly called by the sailors a "Woggin," between the body of the whale and the ship. The water was so discolored by the blood of the whale that nothing could be seen but the head and flippers of the new visitant. He was evidently attempting to get upon the whale's back. One of the crew leaped upon the whale, and the woggin came fearlessly to his hand and was taken on board. On holding a consultation it was determined to kill the strange bird and make a purse of his skin; but one of the number, more humane than the rest, proposed that he should be cast overboard, which was done, and all hands were called to commence cutting up the whale. In a short time the same penguin made his appearance, and by its actions expressed a desire to be taken on board. It was accordingly done by the command of the captain, when the woggin, in a stately manner, walked aft, and showed signs of intense satisfaction and contentment. He was perfectly tame, would suffer the approach of any one of the crew, and, in a few days so far learned his duty as a seaman that when in calm weather he was put overboard to collect his food, which consisted of small fish, he would, as soon as his meal was ended, return to the ship to be taken on board. He became a general favorite with the crew, and received the name of "Jack Woggin," with which he seemed much pleased, and would respond to a call with as much alacrity as a dog. It was singular to notice his exclusive attachment to the crew of that ship. When lying by on the cruising ground for a "jam" (the whalemen's term for a visiting party), Jack Woggin would sometimes, when in the water, approach the boats of other whale-ships, but all the attempts of their crews to get him on board proved ineffectual; he would dive and avoid them, but whenever the boats of the Hubbardston came near him, he would hasten to be taken on board. One day, when a perfect calm prevailed on the sea, Jack had been put overboard for food and exercise, and, in company of some of his own species had proceeded at some distance from the ship, a squall suddenly rose, and the ship was driven three or four miles from its station. All was bustle and confusion when it was ascertained that Jack Woggin had been left behind. The men aloft were ordered to keep a sharp lookout for this fellow-whaleman. In about two hours the joyful cry was heard from the masthead, "Jack Woggin is in sight!" With much difficulty, panting from the severity of his exertions, he approached the ship and was taken on board. He had been swimming for dear life through the turbulent seas to regain his post of duty.

For three months Jack Woggin strutted with a sort of official dignity across the after part of the deck, feeling himself much above going before the mast. He had not an enemy on board, and had he been permitted to see the end of the voyage it is possible he might have come in for a share of the profits. When he wanted anything to eat, he generally walked up to the man at the helm and looked him steadily and wistfully in the face, continuing to do so until his request was granted. He eat beef cut into small slices and freshened, so that it had but little taste of salt, and bread—then would walk to the water-cask for his drink.

But we must approach the catastrophe. One day "Jack Woggin" was asking for his dinner, and the captain, unable to find any freshened meat for him, gave him some slices of salt-junk, and in two hours this jewel of a seaman was a dead woggin. It was something amusingly solemn, almost like a mock tragedy, to witness the lengthened visages and noiseless step of the crew as they gathered around the lifeless and noiseless body of Jack Woggin, laid out in due form, and prepared for his last launch. They looked upon him as they would upon a brother sailor under similar circumstances, or as they might have gazed upon a favorite ship stranded upon a rock, "Whose prow shall never part the billows more."

KUKA.

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN FOR WEEK ENDING APRIL 9TH.—One Lamprey eel, presented; one Albino squirrel (*Sciurus carolinensis*), presented; one Wood-duck (*Aix sponsa*), presented; one small Alligator (*Alligator mississippensis*), presented.

ARTHUR E. BROWN, General Supt.

WAS IT INSTINCT?

PERU, Oxford Co., Maine, April 3, 1877.

EDITOR FOREST AND STREAM.

I have read with great interest the various articles in your valuable paper upon the subject of "Instinct in the Lower Animals," and having had considerable experience in fish culture, more particularly with the celebrated Rangely trout, I naturally have witnessed many remarkable instances of the use of instinct so-called. One of these I will relate. In the autumn of 1870 I procured about two hundred trout, and confined them in the basement of my house in four tanks, side by side, each being of the same dimensions, viz.: eleven feet in length, twelve inches in width, and fourteen inches in height. They were so arranged as to have the water pass from one tank to the other, and thus keep up a constant current and circulation of water, as well as to allow of the trout passing freely from one to the other. I kept these trout confined in this manner for about two years, for the purpose of studying their habits and for experimenting in their culture, etc. These trout would often leap over the partition boards dividing the tanks, and thus pass from one to the other, instead of passing through the connecting spout which had been constructed for that purpose. This they seemed to do through mere sportiveness, as I would often notice the same trout thus pass through all of the tanks in a few moments of time, always stopping in the outside tank when he might just as readily have leaped over the side of it, as it rose no further above the water than did the boards separating the tanks. Had they leaped over this board they would have fallen upon the ground and died. Now, did instinct teach them to stop there? Some will answer, "certainly," so I will only reply, that it was a very remarkable evidence or exhibition of it. But if it was instinct in that case, what was it in this? During the winter the waste-pipe which conveyed the water from the tanks froze up one very cold night in my absence from the house, and upon my return, about nine o'clock P. M., my wife informed that there were strange noises down stairs among the trout. I immediately procured a light and went down, and behold! the cellar bottom was covered with about a foot of water, which had flown back from the waste-pipe, and strange to tell, about half of the trout were out of the tanks and swimming contentedly around the cellar. To get there and out of the tanks they had to leap over the board forming the outside of the tank, and which they had never done before. I immediately raised the walls of the outside tank about six inches, so as to prevent a recurrence of the thing, and they remained quiet for about a month, when the waste-pipe froze again, flooding the cellar, and the trout all leaped out over that board, six inches in height, and I found them as before, swimming around the cellar. I put them back into the tanks, and as the water did not freeze again, they never leaped over that board again. Now, was it instinct that told them when there was water upon the outside of the tanks? Yours, truly, G. O. HAYFORD.

PEREGRINE FALCON

(Falco Peregrinus).

PHILADELPHIA, March 13, 1877.

EDITOR FOREST AND STREAM.

This falcon is not only found in the United States, but also in Europe. In some parts of the country it is known as the "great-footed," or "duck hawk." It is noted as a powerful and acrimonious bird, soaring with ease and grace beneath the measureless sky for hours at a time. Its food consists of ducks and pigeons; it descends almost as swift as an arrow from the clouds, in a perpendicular line, and striking its victim with its powerful wing, catches it in its talons, mounts into the air, and seeks some sequestered spot, to feed on its prey unmolested. When full grown, it measures from sixteen to twenty inches long, and its plumage is very plain in color; its head and neck are of a dark lead color; beak one and a half inches long, black and hooked like that of the eagle; eye full and black; throat and breast of a creamy-white, dotted with spots of dark brown; its tail consisting of twelve feathers, barred with bluish-grey and black, and its wings measure from tip to tip thirty-six to thirty-eight inches; underneath the wings the feathers are barred with light-brown. Under each eye is a triangular stripe of dark-lead color, talons black and one and a half inches long. The peregrine falcon loves to build its nest upon some craggy cliff or gigantic tree. The nest is mostly composed of twigs, lined inside with coarse grass and feathers.

On the 13th of September, 1863, I shot a fine specimen (male) at the corner of Fifth and Girard Avenue, Philadelphia. For nearly three weeks this bird of prey had made its home in St. Peter's steeple, and lived on pet pigeons. Every day he would come from his hiding-place and soar into the air, and start his victims into flight; after they had made two or three circles he would make a dart at the frightened birds, and never missed his prey; he would then seek his hiding place in the cupola and dine on his feathered booty. On the above named day, I borrowed a gun from Mr. Reed, (our gunsmith on Girard Avenue), and shot the ravenous bird, and mounted him in fine style, and sold him to a gentleman in our city for ten dollars. GEO. BOUDWIN,

Taxidermist.

NOT ALL AN OYSTER.

POTTSVILLE, Penn., April 9.

EDITOR FOREST AND STREAM.

A friend residing in Washington relates a singular circumstance regarding what might be termed a shell-fish, and I send it for publication, as it may be interesting to the readers of your valuable paper: "While some men were at work down the Potomac, dredging for oysters, one of them came across what he regarded as an unusually large, fine oyster, which he concluded to open. As the shell, which was about six or seven inches long, was being opened, he pressed one of his fingers into the partially opened shell, when, to his surprise, something inside took a firm hold of his finger, and when he forcibly abstracted it he experienced considerable pain and found it somewhat lacerated. His suspicion and surprise were by this time excited, and he at once opened the shell and was astonished to find that it contained a curious animal several inches long, completely filling the cavity of the shell. The animal very much resembled what is commonly called a 'water-dog,' except that it had no feet. The head was similar to that of a cat-fish, with large mouth full of fine teeth. Just back of its head were two large lobes, which gave it the appearance of a small bull-dog. The man who had his finger bitten suffered considerably, and it was much inflamed."

This animal, whatever it may prove to be, must have made its access to the shell when small, destroying the oyster it found as the natural tenant, growing up to its present size within the calcareous prison usurped by itself. SCRIBERER.

Dr. Elliott Coues will be attached to the *American Naturalist* hereafter as editor of the Department of Vertebrates, an acquisition to that journal of great value.

ANIMALS RECEIVED AT CENTRAL PARK MENAGERIE FOR WEEK ENDING APRIL 14.—Three quail (*Ortyx virginianus*), presented by Master James P. Kein, New York city; two ringdoves (*Turtur risorius*), presented by Mrs. F. H. Daniels, Brooklyn; one snowy owl (*Nyctea nivea*), presented by Mr. Chas. S. Galbraith, West Hoboken; two fox-squirrels (*Sciurus vulpinus*), presented by Mr. J. H. Flagler, Kessport, Pa.; one camel (*Camelus dromedarius*), born in the menagerie. W. A. CONKLIN,

Director

Woodland, Farm and Garden.

GRAFTING TO TEST NEW VARIETIES.

EVERY fruit grower should experiment constantly in the way of grafting, and thus prove for himself the value of different varieties of fruits. In his visits among his neighbors, whenever a good fruit is brought to his notice, he should at once procure a few scivers, and wrap them up in moistened paper until he reaches home, when they should be consigned to a box in his cellar; this box should contain damp moss or sawdust, and should be placed in a cool, moist corner, away from the furnace. Some kinds of fruits, such as apples and pears, graft more readily than others. Peaches, plums, or cherries can be reproduced more satisfactorily by means of budding. The uninitiated in these matters should therefore turn their attention more particularly to the first, and after they have gained proficiency it will be time enough to try the latter. In testing new varieties, it is much more sensible to own a single limb on an old established tree than to purchase a young plant and wait for several years to ascertain perhaps, after all one's trouble, that it is not at all suited to the locality. Of course several grafts may be inserted on the largest limbs, and a large number of kinds may be grown on one tree if so desired. Occasionally the stronger growing kinds will smother the weaker, if care be not taken to keep the former within bounds; and yet there are instances where as many as twenty or even thirty distinct varieties of apples are growing on one tree, all in bearing condition, and the owners sweep away the premiums for the best and largest displays at every show when they exhibit. Old pear trees, whose usefulness has passed away, may be made to produce bountiful crops of delicious fruit once more by grafting over their tops with good kinds; indeed there are plenty of such instances existing to prove how very valuable grafting is where good healthy stocks already exist. J. H.

POOR BRED STOCK.—The attention of our readers is called to an advertisement in another column of an extensive sale of pure bred Alderney stock to be held on May 22d, near Dorking, Surrey, England. American breeders can procure catalogues by sending to Messrs. White & Sons, Dorking.

DROUGHT IN CALIFORNIA.—Our Los Angeles correspondent, El. Cazador, writes, March 24:

The drouth is affecting the sheep and cattle interest fearfully in this county, and many thousand fine sheep will be slaughtered for their pelts. Our rainfall has been less than for twenty years; and in spite of quite a large area of irrigable lands, the year will be a hard one for many.

SELECT SUCCULENT PLANTS FOR AMATEURS.—These are generally known as showy flowering plants, standing our hot, dry summers well, so that but few notes will be required. They can all be propagated from the leaves, forming little bulblets at the base that soon make plants if not kept too damp and shady. Any of them can also be raised from seed, which should be sown in a moderate heat as soon as ripe.

Echeverias for edging—Secunda, Secunda glauca, Pumila, Atropurpurea.

Echeverias for centers—Metallica, Metallica glauca, Pachyphytoides, Schidigera, Scaphylla.

Echeverias for pot culture—Bracteosum, Pulverulenta, Roseum, Farinosa, Fulgens, Lingua, Retusa, Scheeri.

Pachyphyton Bracteosum also makes a good material for outlines in geometrical bedding, and is easily increased. *Kleinia* is a Cape of Good Hope genus that includes a few good species useful for planting out, or for pot culture. *K. repens* is often used in the ribbon border, but is also very useful as a bracket plant for the conservatory; its *blue* leafage is very distinct and peculiar, and renders it valuable for bedding purposes. *K. tomentosa* is a white, wooly looking plant, easily grown and distinct. The old "Candle plant" *K. articulata* is well-known for its quaintness, the other species are lax-growing plants of no great beauty.

Before passing this group of plants, mention must be made of the beautiful little trailing *Anacampseros*. They have flowers resembling those of the *Portulaca*, growing only two or three inches high, and forming a dense mass; the rose-colored flowers grow in scapes, six to eight inches high, and open in the sun. The best species are *A. filamentosa*, *Arachnoides*, *Rubens*, and *Varians*. J. C.

VALUE OF EUCOMIS PUNCTATA AS A HARDY WINDOW PLANT.—I have a bulb, whose two feet flower-spike opened its blooms in the beginning of October, nearly six months ago, and these are almost as fresh as when first expanded. The plant is Eucomis punctata. It has stood the cold of the past winter in the window of a room in which there has been no fire. I grow many of them in pots, the persistency of the flowers making them very useful, and I should think almost indispensable to window gardeners. Although quite hardy, this plant is more suited for pot culture. My treatment is as follows:—Shake out, divide when necessary, and re-pot in April, using sandy, rotten turf and decayed manure. Stand the pots during the summer in a hot sunny situation giving plenty of water; thus treated, in the early autumn every bulb shows a spike of flowers, when they are removed to the green-house or sunny window. The seed-vessel swells in the centre of the fragrant flower without the petals shrivelling or dropping, which serves as a calyx to the pod.—J. M.

THE JAPAN JUDAS TREE.—General ignorance of the character of plants long known to professionals may fairly entitle them to be treated as new. Many of the most beautiful and rare belong to this category. Whence then this want of knowledge? The answer must imply several causes acting variously. The most common, perhaps, are defective appreciation among nurserymen of the profit to be derived by growing these plants, and the resultant general scarcity. Other causes, however, work in, after methods hard to define, such as difficulty of propagation, curious defects not necessarily fatal, and improper management by those first testing. At any rate, from whatever causes, many similar plants continue unreasonably long in comparative obscurity. An example of this may be found in the Japan Judas Tree (*Cercis japonica*). Occasionally seen in catalogues in Europe, it seldom appears in even the finest ornamental grounds of this country. And yet its qualities are of rare and great excellence.

Early in the spring we see its smooth, erect branches wreathing themselves completely with clinging spiral folds of rosy pink flowers. These to a great extent expand and develop before the leaves appear, presenting a striking effect amid the surrounding conditions of spring. The beauty of the leaves fitly accompanies that of the flowers, and in its own way affords equal attraction. Curious and foreign looking in habit, these leaves remind one of nothing else. They are heart-shaped, shining, and leathery, and have a layer-like arrangement that suggests compactness, and rounded bush-like forms. The dark green color is retained throughout the summer, to be relieved in the latter portion then of by a scattered bloom of bead-like flowers, the rosy tints of which are so difficult to describe. The bark is a light drab, and furnishes another of the fine contrasts peculiar to the species.

Indeed, the whole bush, when well developed, has a decided air of richness and rarity, fully borne out by its other habits. The fleshy nature of the roots, increasing so much the difficulty of propagation, is likewise suggestive of the above qualities. Apparently obstructive to its general culture, this difficulty speedily vanishes before proper adjustment of well matured grafts (or scions) to established stocks of America Judas tree (*Cercis canadensis*). Seedlings are open to the objection of variableness in coloring, while the collection of the seed is very uncertain from the unproductive nature of the plant. Well rooted, the Japan Judas tree grows quite vigorously, and readily overcomes a certain sensitiveness to cold while young that only exists during uncommon seasons.

It really seems that choice articles must be always subject to many dangers that the cruder and less valuable avoid; fortunately the reward is well worth the risk. The proper position on the lawn for this plant is singly about the house, on prominent points of shrubbery, or in open spaces near frequented paths. It is worthy of conspicuous positions, and will rarely by overgrowth obscure a favorite view. Plants like this, peculiarly marked for finer quality, seem always limited in numbers by difficulty of propagation. Yet all the more should we seek their possession, actuated by the same motive that attempts to draw about us special friends and choice spirits. SAMUEL PARSONS.

THE FINEST WHIPS IN CREATION.—Sir Rose Lambert says that he had "coached much in Ireland and Wales before the era of railroads, and considered himself qualified to judge of that method of locomotion, but he never saw men handle their ribbons like these California drivers. Their teams, nearly always consisting of six horses, are," he adds, "as well turned out with regard to size, pace and condition as any four-in-hand one sees in the Park during the London season. The roads were simply frightful, and often so rough and steep that many fellows would "funk" out hunting. I am fond of driving, and nothing gives me greater pleasure than to see good driving. These men I consider the finest whips in creation, and it is worth coming all the way to California to learn what coaching really is. Plenty of the members of the Four-in-hand Club look very workmanlike in their tight-fitting trousers, white box-coats, and curly-brimmed hats. Their teams are perfectly matched, and a long purse or a long credit procures them pace, size, blood and bone. They carry their legs straight, their reins are properly arranged in the orthodox fashion, and if the two grooms they generally take behind, elaborately attired in buckskin and tops, are moderately active, they can get round a tolerably sharp corner or succeed in doing Hyde Park much to their own satisfaction. But as to driving, in the real sense of the word—well, ignorance is bliss, though in their case it would not be folly to be wise. Our *old* coachmen could drive. Between Cork and Dublin and Limerick and Galway, and before those days between London and York, there were many real coachmen. French, German, and Continental coachmen generally are nearly all tailors. Like most Englishmen, I always fancied that driving was our specialty, but after going a thousand miles over California roads and with California drivers, I confess that I cannot so much as touch them."—*San Francisco Chronicle.*

TO KEEP LICE FROM SITTING HENS.—Sprinkle sulphur—a handful to a hen—twice a week on the hen, when on her nest. Take the sulphur in your hand, commence at the hen's tail, let your little finger just touch the feathers on her back and she will raise them; move your hand toward her head, letting the sulphur scatter among her feathers. This will keep off the coop lice, the bane of the poultry house. Don't put on the sulphur within three days of the hen's hatching, and it won't hurt the chicks, sure, if your hen sits well and hatches well.

The Kennel.

BENCH SHOW NOTES.

THE entries and attendance from Great Britain at the New York Bench Show promise to be very large. Mr. Lincoln has received, among many others, a letter from Hugh Dalziel, Esq., of *The Country*, and Hon. Secretary of the Dandie Dumont Club, saying that he will be here with a number of dogs. In the last issue of *The Country* we find an advertisement from Mr. S. W. Smith, one of the largest breeders of fox terriers in England, in which he states that having been requested by several gentlemen to take their dogs to the International Dog Show, New York, he will take still more if desired. Mr. Lincoln is receiving letters from portions of England where it would scarcely be believed that news of this show could have penetrated, requesting particulars and entry blanks. There is no doubt, whatever, that could the Committee have secured the Hippodrome for a fortnight later, as was desired, there would have been a representation of several hundred dogs from across the water.

The railroad arrangements promise to be very complete. Letters have been received already from the managers of the following lines, stating that dogs from all points on their roads would be carried to and from New York for the Bench Show: Erie Railway, Canada Southern Railway, New York, New Haven and Hartford Railway, Lehigh Valley Railway, Pennsylvania Railway, New Jersey Central Railway, and

others. The Lake Shore and Michigan Southern Railway have made a tariff for dogs of twenty-five cents for the first one hundred miles, and ten cents per one hundred miles after that. By this arrangement owners can bring their dogs even from the far West at slight expense.

The picture gallery will be a novel and attractive feature. Artists who have made paintings of dogs are requested to communicate with Mr. Lincoln, and the same request is made of all who may have such paintings or engravings. A number have already been offered, and should there be sufficient to make it an object, an appendix will be added to the regular catalogue. The garden will be made very attractive with its fountains, waterfall, etc., and from the numerous applications being made for stalls for the exhibition of sporting materials of every description, it would seem that in addition to a dog show there was to be a fair.

A letter has been received from Gen. Knollys, Private Secretary to the Prince of Wales, in response to an invitation to the Prince to exhibit some of his dogs. H. R. H. wishes the show every success, but regrets that it will be impossible on so short a notice to send any representatives from his kennel. We noted last week that Mr. Macdona had written that the eminent judge Mr. Lort would probably accompany him from England. The presence of two such authorities at our Bench Show would not only be of immense value, but would add greatly to the *eclat* of the occasion.

Not the least attractive feature of the show will be the magnificent display of that noblest of dogs, the St. Bernard. Mr. Burdett Loomis, of Hartford, will exhibit his entire kennel, and at least twenty-five States in all have been bespoken for this one breed. There will also be a large exhibit of mastiffs, and one other feature quite new to American shows—that is, an exhibit of toy terriers in glass cages.

There is a joke on the W. K. C., which is too good to keep. When the Premium List was prepared gold was quoted at 104. It has now reached 107½, and it looks as though it might go to 130, which would work rather a difference in the premiums. We suggest to the Club to "cover their shorts" while they can.

CANADA ON THE U. S. BENCH SHOW.

STRATROY, Ontario, Canada, April 12, 1877.

EDITOR FOREST AND STREAM.

I am in receipt of prize list for the Bench Show to be held at Gilmore's Garden, New York, under the auspices of the Westminster Kennel Club, on the 8th, 9th and 10th of May. The list, including special prizes, is a very good one—I think the best, without any exception, offered at any dog show ever held in this country. The special prizes are exceptionally good, being composed of not only good, but useful articles—such as guns, fly rods, etc., etc.; and the cups, I understand, are sterling silver, which should always be the case for trophies of this kind, no matter how small. With such a special prize list, and $30 and $20 gold as first and second prizes for sporting dogs in the open classes, it should be sufficient to please all competitors, if not after, certainly before the awards are announced. For my part, I consider it a most liberal prize list, indeed, and one which should bring together a grand collection of dogs, with Mr. Charles Lincoln as manager. I have only to say, when I saw him managing the first show I ever attended in this country, I then made up my mind he was either just fitted for the place or the place for him, I could not make up my mind which; and after meeting him at several of the big shows since, I am just as far from coming to a conclusion as to which it is; but one thing is sure, a dog show has no business without him. I also notice Mr. John Davidson, of Monroe, Mich, is to be one of the judges. Well, I don't know what friend John's knowledge of sky terriers is, but if I have a setter or a pointer possessed of any weak points, please oblige me by not allowing him to judge in these classes. I would here offer a little friendly advice to disappointed exhibitors, if in Mr. Davidson's classes. For gracious sake don't question him as to the whys and wherefores that things are thus thusly. If you do so, just look him squarely in the face, and if you don't get withered, then I apologize. I once tried it—only once, my dear friends; I won't repeat it, I promise you I will not; I shall never forget the expression; I can't describe it. A double-barrel steel trap on full cock, and me stepping back for fear it should go off, is as good an illustration as I can give you of the picture. I was foolish enough then to think I knew more about dogs than Mr. Davidson did. I have long since come to the conclusion that I was laboring under a mistake. The very fact that English sportsmen are coming across the Atlantic especially to see this show, should be an incentive to all the sportsmen in America to turn out and make such a show of it as we shall be proud of as long as we live.

Yours truly, DOG WHIP.

—Mr. L. W. White's liver and white pointer bitch Grace, whelped on the 6th inst. five puppies, all dogs, by the imported dog Morn. Morn is a lemon and white dog, imported in Utero by Gov. William Sprague, of Rhode Island, and strange to say, every one of these puppies was in color and markings exactly like his sire. Grace is the first bitch he has served, but we are requested to announce that he will be at the New York Bench Show, and will serve *free* the bitch of any exhibitor, providing she is pure bred, has an authenticated pedigree, and is of any other color than lemon and white, the object being to prove whether he will transmit his color, as it is claimed that the strain has bred true to color for nine generations. Morn stands 26 inches high at the shoulder, and weighs 57 pounds.

DOGS STEALING EGGS.—Somebody inquired recently for a remedy to cure dogs from stealing eggs. A correspondent writes, that by observing the following proceeding a cure will surely be effected:

First find what hen-house the dog is in the habit of visiting; then take an egg and prick into one end of it a liberal amount of Cayenne pepper, and all you have to do is to watch the effect, and if it is not a sure cure then it must be a strange kind of a dog. Hoping that this will prove a benefit to "C," Lancaster Pa. PEDRO.

THE CAUSE OF GUN SHYNESS.

BLACKSBURG, Va., April 2, 1877.

EDITOR FOREST AND STREAM.

In a late issue of your paper I find a letter from Capt. J. M. Taylor, in which he gives expression to an opinion which seems to be getting very prevalent now, and is being apparently pushed to extremes. Capt. Taylor attributes gun shyness to breeding setters at puberty. Recently, in correspondence with the owner of the dog I considered the best to breed my young slut to, the gentleman expressed himself unwilling to breed his dog to any slut less than two years old, because at an earlier age than two years he thought a setter slut too immature to breed anything but immature and weakly pups. With all due deference to the opinions of others, I beg leave to say that I differ very widely from them. I have been breeding and breaking setters and pointers for thirty years, and in that time I have had three badly gun shy. The first of these was from a slut and dog each about 6 years old. The second was from a dog past 10, and slut about 5 years old. The last was from a slut never bred until past 3 years old, and by a very old dog. I am aware that individual cases count for little, but has Capt. Taylor any other sort of argument for his view of the case? I have seen gun-shy dogs of every breed. At times it appears to be of accidental acquirement and merely individual attachment, but like all other traits, it is unquestionably hereditary, as was the case in all the instances I have known. I give sportsmen the assurance that a dog or slut having this defect, even though perfectly cured; as it very often can be by judicious treatment, will very often, and long after the cure, produce offspring in which the defect will reappear. A setter slut will be in heat for the first time, usually, at from 10 to 14 months old, most frequently in my experience a little past 12 months, and at that time it is far better to breed them than not. It appears to be clearly established that females which produce young at an early age make the best mothers, and it is equally certain that animals allowed to pass by the period of puberty for several years sometimes cannot be bred from at all, having become barren from desire of the reproductive functions. In matters of this sort nature is a tolerably good guide, and it will be seldom that a slut will be in heat before she is mature enough to breed. I believe there is no evidence that the whelps of the first litter of young mothers are in any way inferior to those of any subsequent litters. I have been familiar with the breeding of dogs from earliest infancy, as my father always kept and bred a vast number of them, being devoted to the chase, as I myself have always been. I have never met with a fact or statement which tends to establish the idea that a setter slut at 14 or 15 months old—the usual time for the first litter—is too immature to bring forth healthy and vigorous young. If there be among the highly bred English setters of recent importation a disposition to gun shyness and idiocy, it is not to be attributed to their having been bred too young, but to too close inbreeding and the absurdly artificial treatment to which they are subjected in the kennels of professionals. If breeding from young mothers would produce idiots, it would seem that Jersey cattle ought to be the most foolish beasts in the whole world. I do not advocate a system of breeding which has for its object the development of precocity in this respect. I have some experience in physiology and Natural History, and much in the breeding of all kind of animals, and I advise inexperienced sportsmen not to allow any setter slut to become 3 years old before she becomes a mother if it can be helped, if she is to be used to breed from. It seems to me gentlemen scarcely consider the effect of their words when they speak of a dog 14 or 15 months old as a wholly immature puppy. As this is a question of high interest, I think I might venture to ask that if Capt. Taylor has any statistics upon which his opinion is based, he will be kind enough to give them to the public. Yours, etc.,

M. G. ELLZEY.

SETTERS—ENGLISH, SCOTCH, AND IRISH.

BY STONEHENGE.

THE IRISH SETTER.

THIS breed has long been known to sportsmen throughout Great Britain as a good one, especially in point of stamina, and a class was set apart for it at Birmingham in 1860, a year before the black and tans were similarly favored, though, I think, hardly from so flattering a cause, and most probably from the circumstances that Mr. Jones, of Oscott, who was then a prominent member of the committee, possessed two specimens of the breed, which he had recently obtained from Ireland; but, to his disgust, Major Irving, who judged the class, awarded the first prize to Mr. R. F. Onslow, of Herefordshire, Mr. Jones getting a second only with his Carlo, with which dog, however, under the same judge, he beat a better class in 1861, including Mr. Watt's Ranger, a sloshing one in appearance, but, unfortunately, with a pedigree which was disputed. In 1863 Major Hutchinson brought out Bob, whose pedigree exhibits a strain of the celebrated La Touche breed, and with him he carried off the chief prizes at Birmingham, Cremorne, and Islington in 1864, leading to his selection for the illustration of the article on the Irish setter in 1865. He was, however, not a typical specimen, being too heavy both in frame and head, and obviously overtopped, although otherwise useful, and, I have reason to believe, thoroughly good in the field. In 1867 Capt. Allaway exhibited his beautiful brace, Shot and Grouse, which were generally accepted as showing all the peculiarities of the breed, and of such a fine formation that Shot, considered by me inferior in shape to his brother, obtained the silver cup for the best setter in the show, after a warm dispute between the two judges, Messrs. Lang and Walker, in which the former, an excellent and experienced judge, stuck to the Irishman throughout, while the latter was as strongly in favor of Fred II., a well-known Laverack, and the referee was called on to decide between them. Capt. Allaway maintained his position till 1871, when Capt. Cooper brought out his Ranger, a son of Hutchinson's Bob, and also straining back on the dam's side to the La Touche kennel. At length, in 1873, Dr. Stone came out with his Dash, who was admitted to be almost perfect in shape, and of the true type. He took every prize until age compelled his retirement in favor of Mr. Hilliard's Palmerston, who may now be considered the best public representative of the breed. Dash is of Dr. Stone's own strain, which he has kept to himself for twenty-five years, in color blood-red, showing white on his head and toes, and also on his neck, with great quality, and a faultless frame.

There is no reason to suppose that any improvement had taken place in this breed in its native country until very recently, when the institution of local shows seems to have stimulated Irish breeders to fresh exertions; but in the exhibits which have been made on this side the Channel the chain of progress has been unbroken from Carlo to Dash and Palmerston. In the field trials, the Rev. J. C. Macdona has raised its character by producing his Plunket at Shrewsbury in 1870, after which he was sold to Mr. Purcell Llewellyn, and took prizes at Vaynol, Southampton, and Shrewsbury. This dog was very small and bitch-like in appearance, and rather light in color, but his pace was very great, though not perhaps quite equal to that of the Laverack Countess, while his style of going and his attitude on the point were far superior to hers. He was bred by the Hon. D. Plunket, and combines the blood of that gentleman's kennel with the La Touche and Hutchinson strains. Mr. Purcell Llewellyn purchased him in the height of his successes, and bred several average dogs from him out of Kate (of the Knight of Kerry's strain), including Kimo, Kite, and Kitty; while another litter, out of Buckell's Min, contained Marvel, May, and Knowing, less successful than the former, both on the bench and in the field. With the solitary exception of Plunket, however, no Irish setter has shown anything like high form in the field trials, Mr. Purcell Llewellyn's Samson, who is above the average, being crossed with the Laverack Prince through his dam, Carrie, though both are entered in the Stud Book as Irish setters.

After a great deal of discussion, a separate class has been made in Dublin and elsewhere for reds and white and reds, it being shown that there are two distinct strains of the Irish setter, of these colors respectively. The white and reds stand no chance in the open classes, and yet it was considered hard to debar them from all prizes, especially as by some good judges they are thought to possess better noses than the reds. According to my judgment, the rich red, or blood-red color as it is described, is made a little too much of, and I should strongly object to the passing over of excellence in shape because the color is too pale, a marked instance of which happened at the Brighton show of 1876. Here one of the grandest bitches I ever saw in shape, size and quality, who had won several prizes in Ireland, and moreover of excellent blood, succumbed to very mediocre animals, simply because her coat was too pale in color, though very little, if any, paler than that of the above-mentioned excellent dog Plunket. If this class had been judged by points, the bitch in question would have distanced her competitors, because she would have been credited with a full allowance for all other qualities, and could only have had ten points altogether knocked off for the negative value of color.

The old breeds of this dog most celebrated are the O'Connor (generally known as La Touche), Lord Dillon's, Lord Clancarty's, Lord Lismore's Lord de Fresno's (usually called the French Park), the Mount Hedges, Lord Rossmore's, and the Marquis of Waterford's. In modern days Dr. Stone, Major Hutchinson, Capt. Cooper, Capt. French, Mr. H. B. Knox, Hon. D. Plunket, Capt. W. Allaway, Mr. Hilliard, Mr. Lipscombe, Mr. C. Brien, and Miss Warburton have been most successful on the show bench; but, with the exception of Plunket, none of them have proved the excellence of their strains at any field trial.

In points the Irish setter only differs from the English the following:

1. The skull is somewhat longer and narrower, the eyebrows being well raised, and the occipital prominence as marked as in the pointer.

2. The nose is a trifle longer, with good width, and square at the end; nostrils wide and open, with the nose itself of a deep mahogany or very dark fleshy-color, not pink or black.

3. *Eyes, ears, and lips.*—The eyes should be a rich brown or mahogany color, well set, and full of intelligence; a pale or gooseberry eye is to be avoided. Ears long enough to reach within half an inch or an inch of the end of the nose, and, though more tapering than in the English dog, never coming to a point; they should be set low and close, but well back, and not approaching to the hound's in setting and leather. Whiskers red; lips deep, but not pendulous.

5 and 6. In frame the Irish dog is higher on the leg than either the English or black and tan, but his elbows are well let down nevertheless; his shoulders are long and sloping; brisket deep, but never wide; and his back ribs are somewhat shorter than those of his English brethren. Loin good, slightly arched, and well coupled to his hips, but not very wide; quarters slightly sloping, and flag set on rather low, but straight, fine in bone, and beautifully carried. Breeders are, however, going for straight backs like that of Palmerston, with flags set on as high as in the English setter.

7. Legs very straight, with good hocks, well-bent stifles, and muscular but not heavy haunches.

8. The feet are hare-like, and moderately hairy between the toes.

9. The flag is clothed with a long, straight comb of hair, never bushy or curly, and this is beautifully displayed on the point.

11. The coat should be somewhat coarser than that of the English setter, being mid-way between that and the black and tan, wavy but not curly, and by no means long. Both hind and fore-legs are well feathered, but not profusely, and the ears are furnished with feather to the same extent, with a slight wave, but no curl.

12. The color should be a rich blood red, without any trace of black on the ears or along the back; in many of the best strains, however, a pale color or occasional tinge of black is shown. A little white on the neck, breast, or toes is by no means objectionable, and there is no doubt that the preponderance of white, so as to constitute what is called "white and red," is met with in some good strains.

In his *work*, the Irish setter is fast and enduring; his nose is quite up to the average of fast dogs in delicacy, and to those who are limited to a small kennel, he is an invaluable aid to the gun. His style of going is very beautiful, with head well up and feeling for the body scent; he has a free action of the shoulders, hind-legs brought well under him, and a merry lashing of the flag on the slightest indication of scent—often, indeed, without it. His advocates contend that he is as steady as any other setter when once broken, but, as far as my experience goes, I scarcely think this position can be maintained. Neither Plunket nor any that I have seen of Mr. Purcell Llewellyn's breeding, nor indeed any of those which I have had out in private, have been always reliable, and I fear that, like almost all other setters of such high courage, it must be admitted that he requires work to keep him in a state of control fit for immediate use with the gun. In this respect, and indeed in delicacy of nose, both the English and Irish setter must yield to the black and tan of the best strains; but to do the same amount of work, at least a double team of the last mentioned must be kept.

I have not yet obtained a good portrait of the Irish setter, but hope to obtain one in time for the republication of these articles in book form.

In comparing the three breeds of setters, we should have to place Countess and Nellie (English) against Plunket *sobs* to represent the Irish, while the black and tans could only muster Rex, who, on a good scenting day would have stood no chance with either of the three from want of pace, though on a bad one he could as certainly have taken every point.

—An entire kennel of dogs, the property of a gentleman going abroad, is advertised in another column. If the stock is what it is said to be, there may be some bargains to be had.

—Mr. S. T. Babcock, of Piermont, N. Y., claims the name of "Jilt" for his red Irish setter bitch pup, out of Mr. Chas. H. Raymond's Bonnet Carré, by Wm. Taylor's imported red Irish setter Carlo.

A USEFUL CEMENT.—*Iron* publishes the receipt for making "chrome cement," which, as it will not yield to the action of water, is likely to come into general use for mending various articles of glass, chinaware, etc. It might also be very valuable in making aquariums. It consists of a strong solution of gelatine, to which has been added, for every five parts of gelatine, one of a solution of acid chromate of lime. The mixture becomes insoluble in water under the action of light, in consequence of the partial reduction of the chromic acid, and this property is utilized on several occasions in photography. Prof. Schwarz has been experimenting with it as a cement for glass. With a fresh preparation of the solution he covered the surfaces to be united as evenly as possible, pressed them together, and then tied them together. He then exposed the glass to the sun, and at the end of a few hours the operation had perfectly succeeded. Boiling water has no effect on the oxidised cement, and the fracture could scarcely be recognized. Valuable objects in glass, which would be disfigured with common cement, can be satisfactorily repaired in this manner. It is probable that microscopic object-glasses could be better fastened with this than with black asphalte.

UNDOUBTEDLY one of the best and cheapest stocks of Carpetings, Oil-Cloths, Matting, etc., etc., to be found in the United States is that of MESSRS. JOHN H. PRAY, SONS & CO., Washington Street, Boston. I. W. Adams is the sportsman of the firm, and will take special pains to please any of our friends calling upon him, or with any orders sent him. It is a good, reliable house.—*Adv.*

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

L. H., Jr., Philadelphia.—Will you inform me where I can obtain a water spaniel pup of pure and choice breed? Ans. By addressing J. H. Whitman, Chicago, Illinois.

H. H., New York.—Please tell me what is the cheapest and best book on managing the dog in the field and where I can get it? Ans. "Dinks, Mayhew and Hutchinson;" price $3. We can send it.

CHESTER, Birkenhead, Eng.—The finest caribou antlers in this country are to be found in Newfoundland. The caribou there carry very large and beautifully palmated antlers, and in many cases have *both* brow antlers well developed.

J. W.—1st. What would be a good pattern for a 10-gauge breech-loader cylinder-bore gun at 40 yards with 4 drachms of powder and 1¼ oz. of No. 6 shot? 2d. What reputation has Clabrough as a gunmaker. Ans. 1st. 110 pellets. 2d. Very fair.

A. W. H.—1st. How much does the new Flobert rifle cost—those which have a catch to prevent the hammer from flying back? 2d. Would I be likely to find any bay-bird shooting in the vicinity of Nahant and elsewhere? Ans. 1st. From $12 to $15, according to weight. 2d. Yes, in the proper season.

R. McO., Elizabeth, N. J.—I have a 9-pound 10-gauge gun, cheap got up, twist barrels, with 4¼ drachms powder and 1¼ oz. No. 4 shot, at 40 yards, at one half the daily *Sun* paper, put 42 pellets in. Is that good shooting, and are Monton's guns considered good? Ans. The shooting was poor, and as Monton has been dead very many years, your gun is probably a cheap imitation.

F. N. L., New York.—1st. Do you know a gunmaker by the name of H. Fisher? What is his reputation? 2. Do not Fulton, Bodine, and Gildersleeve belong to the Amateur Rifle Club? Ans. 1st. We presume you mean Homer Fisher, the dealer in rifles. He is now making a muzzle-loading rifle, the reputation of which is yet to be established. 2d. Yes.

L. S. L., Rockville, Conn.—I have a Parker 10-bore, which is about one inch too short in the stock. Do you know of any one that could put on a rubber cushion or other attachment that would lengthen the stock and save the recoil somewhat, and at the same time look well? Ans. It can be done by putting in a rubber butt plate of the right thickness. Parker Brothers could do it for you.

P. H. Y., West Philadelphia.—I have a setter dog that is afflicted with a jerking through his body and limbs. I suppose it came from distemper. Will you be so kind as to publish a cure, if you know of one? Ans. Your dog has chorea or St. Vitus' dance, and we question if there is a cure for it.

ROCHESTER, Pa.—I have a gun that loads badly. Can you explain the cause? Ans. Use a couple of blank charges, that is, without shot, before you commence to shoot, and your gun will not lead. It is possible that your shells are to short, and the shot scrape against the shoulder of the chamber. You can get Ely's shells, 10-gauge, up to 3¼ inches.

P. H., Boston.—Can you inform me where I can obtain a copy of the "Game Laws" of this State? Also, what are the best trout streams of this State, and the best months to go? Ans. Will send you copy of Game Laws. The best trout streams of New York are in the Adirondacks, without doubt. Go in latter part of May and whole of June.

W. H. W., Philadelphia.—When I am trout fishing I suffer from the black fly. Can you tell me of any preparation that I can use that will prevent their attacks? Ans. Try a mixture of Bermuda tar, sweet oil, and essence of pennyroyal. There are many different recipes for fly-preventives.

C. S., Savannah, Ga.—1st. What will it cost to have the locks to my breech-loader altered so as to make the hammers rebound, and to whom shall I send them? 2d. Shall I send the stock with locks attached, or will it do to send only the locks? Ans. 1st. Something depends upon the quality of the locks; from $7 to $10. 2d. H. C. Squires, No. 1 Courtlandt Street, will do it; send the whole gun.

W. M. C., Erie, Pa.—We have a pet kitten, highly prized in the family, that lately is suffering with running at the nose and eyes, has a cough and cannot swallow, although she seems very hungry. Will you be so kind as to tell me of anything to relieve it? Ans. Give your cat a Dover's powder night and morning for two days, placing the powder dry on the back of her tongue. Afterward give her a teaspoonful of cod liver oil twice a day.

E. W. C., Germantown.—My beagle pup (bitch) shows signs of the distemper. How had I better treat her? She runs a little at the eyes, and has a dry, husky cough; otherwise quite well. Ans. While the symptoms are so mild we should give a Dover's powder, placed dry on the back of the tongue morning and night.

E. O. A., Exeter, N. H.—1st. Where can I procure an accurate map of Moosehead Lake and the region around it? 2d. I have an English double-barrel breech-loader with the name "Ward & Sons, London," stamped on the barrels. Do you know of any such firm, and do they make a reliable gun? Ans. 1st. At office of T. W. Ripley, printer, 138 Congress Street, Boston. 2d. We do not know them.

F. H. L., Lynn, Mass.—Will you please give the readers of your paper in this vicinity the dimension of the Creedmoor target for 200 yards range, also the subdivisions as made by the Massachusetts Rifle Association? Ans. Eight inch bull's-eye, 36-inch centre, 46 inch inner, outer rest of target. We believe the Creedmoor targets are now used in Massachusetts.

PEDRO, Bridgewater, Mass.—How long before the "Stud Book" be published? and how much longer can we enter dogs in it? Ans. The publication of the Kennel Stud Book has been delayed until after the New York Bench Show. At that time there is to be a meeting of the National American Kennel Club, when it is hoped that arrangements will be made for the issuing of but one book.

SUBSCRIBER, Ashbysburg, Ky.—I noticed in your paper some time ago a recipe for waterproofing, and one of the ingredients was solution of India-rubber. I have tried every good drug store in the vicinity, but cannot get it. Would you be so kind as to inform me where I could procure it? Ans. It was the virgin or native India-rubber that was to be dissolved in benzine. It can be had, probably, of D. Hodgman & Co., 27 Maiden Lane, this city.

D. A. H., Ashbysburg, Ky.—1st. Do you know anything of those watches advertised in your columns? Are they good? 2d. In shooting 20 yards off-hand I generally make a string of 10 to 15 inches, is that an average or below for good shooting? 3d. I would like to learn something of gun-making; are there any books treating of the subject? Ans. 1st. We believe they are worth the money. 2d. You do not state how many shots. 3d. You must be born again and serve an apprenticeship.

E. B., Brooklyn.—I am using Flobert cartridge in a 15-inch Stevens rifle, and as the manufacturers of these Floberts do not grease them, will you please tell me how I can make or where I can buy the article used for this purpose? I greased some of them as well as I could, and the result was increased penetration and greater accuracy. Ans. Make a lubricant of one part pure beeswax and two parts sperm oil, in weight.

X. Y. Z., N. Y.—I wrote you some time ago to advise me about duck shooting at Babylon, and you answered through the columns of your paper not to go there, but to go to Shinnecock. I have been there, and had pretty good luck, but want to go somewhere nearer, if you will answer those same questions, who to address, guide, etc. Ans. Write to Rube Anderson; he has a house on Oak Island, opposite Babylon, or go to Babylon and hunt him up. Charges probably about $8 per day for battery, decoys, board, etc.

J. M. D., Irwin Station, Pa.—When you say 3½ drachms of powder and 1¼ ounces shot for a load, do you use Troy, apothecaries', or avoirdupois weight? 2d. Is the powder and shot gauge made by Capewell & Son a correct one? 3d. Where could I get Lafayette mixture? (our druggist don't know anything about it). Ans. 1st. Neither; we mean the powder measure marked on Dixon's measures, one drachm of which corresponds with *about* 27 grains Troy or apothecaries' weight, and is therefore about a drachm apothecaries. 2d. We do not know it. 3d. Your druggist could get it through any wholesale druggist in this city.

C. J. F., Plymouth.—I have a pointer pup five months old. He is perfectly well, with the exception of his forward legs, which have large bunches on them, hard in the middle and lower joint, and after he has been out a little while his legs tremble, and will hardly support his body. Ans. From the above and the further symptoms you describe we should say that your dog will never recover sufficiently to be of value, and if ours we should destroy him. Your diet is correct, but the jolting of the wagon would have a tendency to aggravate the trouble.

P. H. D., New York.—Where can I find the pedigree of Alfred and Moll, of the Marquis of Anglesea's kennel? One of their pups was brought to this country in 1854. Can you tell me by the 12th inst? Ans. We can find no such dogs in the English Kennel Stud book as credited to the Marquis of Anglesea's breed. Mr. Lort now has some of the breed, his bitch, Dip, being out of Darkie (Marquis of Anglesea's breed), and the grand dam of the celebrated Ranger. Mr. Macdona or Mr. Lort, who will be here in May at the bench show, can supply all the information.

G. R., Rochester.—1. Please tell me how to prepare a bird's breast so it won't shrivel up? 2. What action on a gun do you like best? 3. Do you like a 10 or 12-bore for general work? Ans. 1. For general preparation a taxidermist would use arsenical soap, but an epicure would, if the bird was a fishy one, put a few slices of onions in the dressing; if not fishy, don't use the onions, but you want a thin slice of pork laid over the breast in either case. Season to the taste. Place in a quick oven if small birds. Not so hot if large ones. 2. Top-snaps. 3. 12-bore.

C. W. C., Central City, Col.—I have a Scotch pup five months old that is very weak in his hind-quarters, lolling to the right side when he stands or walks. I brought him out from the East two months ago, and soon after his arrival he was taken sick—grew thin and weak, no appetite; hasn't grown any since I received him. Ans. Your dog has chorea. There is scarcely a cure for it. A tonic of quinine and iron, with plenty of the most nourishing food, is the best treatment you can follow; or one-eighth of a grain of the extract of nux vomica, two grains quinine and one-half grain reduced iron, given in a pill three times a day for two weeks.

C. M. B., Boston.—I have recently purchased a fine English bull dog, who seemed in perfect health till within a week. His neck has been drawn aside, and all efforts to cure him have been unavailing. He eats little or nothing, and is very poor. Can the trouble with the neck be rheumatism? He has had no cold, and has been exposed to the weather but little. Cannot the loss of flesh be attributed to worms? His breath is offensive, and there is a tendency to mange. Ans. Your dog is probably generally out of health. We should give him first a cathartic, say two U. S. compound cathartic pills. Afterward ten grains quinine, and ten drops tincture of iron for a few days. If the trouble in his neck remains it is probably rheumatism, and the neck should be well rubbed with soap liniment or opodeldoc.

T. L., Darien, N. Y.—1. What is the State bounty in Wisconsin on bears? If you do not know, please tell me whom to inquire of? 2. I have seen the statement that bears were very abundant in the western part of Newfoundland; is it so? 3. I observe that a custom prevails among manufacturers of breech-loading rifles to make a difference of $3 to $5 between round barrels and octagon, of same length, weight and finish, and using same cartridge. Now, whence does this difference arise? 4. Is the recoil given by a 100-grain metallic cartridge sufficient to inflict injury, provided a dozen were fired in succession? Ans. 1. We do not know: address the Secretary of State. 2. Not enough so to prove profitable. 3. They are more expensive to make and finish. 4. Not if the rifle was of the proper weight.

R. F., New York.—1st. Can you inform me whether a cocker spaniel needs training? I have been told to the contrary by a prominent dog dealer. If so, can you recommend me to a responsible party, and what would be the approximate cost? 2d. Can you tell me the pedigree of one of Mr. J. G. Bennett's cocking pups, three months old, sold at auction by Barker & Chase, February 7, 1877? Ans. 1st. Certainly, they require breaking. They must be taught to drop to shot, to come to heel, to range close, and to return. We know of no one who makes a specialty of breaking cockers; perhaps Mr. Waumaker would take him; see advertisement. 2d. We cannot.

L. W., Indianapolis, and 100 others who have replied to advertisement in FOREST AND STREAM, March 29th.—I beg to describe the two Greener treble-wedge, fast breech-loaders for sale. Both are new, handsomely finished and engraved barrels of fine laminated steel: 10-bore—barrels, 32 inches; stock, 14 inches; weight, 9 pounds 11 ounces; drop of stock, 3½ inches; pistol hand, full choked; original cost, $250; selling price, $165. 12-bore—barrels, 30 inches; stock, 14½ inches; weight, 7¾ pounds; drop of stock, 2¾ inches, not choke-bored; original cost $225; selling price, $150. Both guns are perfect in every particular.—H. J. WARNER, 67 Exchange Place, Room 18.

J. W. W., Gilmore's Mills, Va.—I have several valuable hounds which have been affected for some time past with what I would call the "blind staggers." When they are first attacked with the disease their legs become weak, they grow thin and gaunt, and their eyes assume a glistening, transparent appearance. As the disease advances, their eyesight leaves them, and they do nothing but stagger blindly around. I have done everything I can think of for them, but it seems to have no effect. Would you have the kindness to suggest a remedy for this ailment? Ans. Your dogs are suffering from some cerebro-spinal irritation, probably due to some specific blood poison. We advise you to consult the best physician in your place, who can inquire more fully into the history of the disease.

PINE TREE, Utica, N. Y.—1. Would you advise me to breed from two setters which are brother and sister? 2d. Shall I have my bitch visit a dog in her first heat? 3d. What would a Parker gun having the best Damascus barrels, pistol grip, but same locks and finish as a $50 gun, cost? 4th. Where can I procure a tapering braided silk fish line? 5th. I wish to buy a book of you on the dog; whose work would you advise me to take? Ans. 1st. We should not; if there is any defect, you perpetuate or continue it. 2d. We consider it bad policy to do so. 3d. Write to Parker Brothers, Meriden, Conn.; we presume the cost would be about $100. 4th. From any of the dealers in fishing tackle advertising in our columns. 5th. "Dinks, Mayhew & Hutchinson;" price $3.

C. A. P., Peterboro.—1st. What is your receipt for cleaning gun barrels that have become leaded? Have read it in FOREST AND STREAM a dozen times, but cannot turn to it now. 2d. My deer-hound has a soft, pulpy lump on the outside of his ear, about three-quarters of an inch in diameter, which becomes sore from rubbing during the hunting season. Can you give me the cause and the remedy? Ans. 1st. Benzine and oil mixed, and the scratch brush, but be careful and use plenty of oil with the latter, or you will scratch the barrels. 2d. We should draw the lump to a head with a flaxseed poultice, and then cure with salve.

FRIEND, Brattleboro, Vt.—1. What are the dimensions of Bogardus' ball trap, length and weight, also height of the back spring? I thought it might be too cumbersome to send by express. 2. What book can I purchase that is the best instructor on taxidermy, and the price and place to buy it? 3. Is there any shooting of any kind of game in any season of the year in the vicinity of Calais, Maine? If so, please state the different kinds, and if it is plenty. Ans. 1. Length, 30 inches; width, 13 inches; height of spring, 14 inches; but the latter can be pressed into the standard, making the height 10 inches. 2. Field Ornithology. We can send it. Price, $2 50. 3. Bay birds, ducks etc., in fair quantities.

E. S. C., Boston.—What is the price of "Camp Life in Florida"? What is the price of Atwood's Map of Florida? What is the price of an Adirondack boat, and is there any builder nearer to Boston than J. H. Rushton, Canton, N. Y.? Is there any map of the northern part of Maine, and what is the price? What kind of flies should be used for spring fishing for brook trout in Massachusetts or New England States generally? Ans. Price of "Camp Life in Florida" $1.50; of Atwood's Map, 75 cents. There are builders of Adirondack boats at Long Lake and Saranac Lake, but you cannot get them shipped as easily as from Canton. Best map and guide to Moosehead Lake and Northern Maine is printed by T. W. Ripley, 138 Congress street, Boston. You want black gnats and cow duns, and yellow or subhyaline colors for spring fishing.

J. F. C. MOORE, City.—Do yellow perch take the fly? If so, what kind are best for June, July, or August? Can you tell me the best place for bass and weakfish near New York? What is the best bait? Will not the eagle claw trap get rusty in fishing? Ans. Yellow perch (*perca flavescens*) take the fly in midsummer frequently when cast for bass, but they are not surface feeders, and usually swim deep. The best place for bass near New York shifts with the time of year. For spring try the Westchester Creek, Little Hell Gate, and vicinity; in fall they are numerous in the harbor near the Staten Island shore, on what is known as the Jersey Flats. Weakfish are taken at the Narrows, and in Sheepshead and Canarsie Bays. The eagle claw is of German silver.

G. H. H., Bridgeport, Conn.—1st. My setter's nose is warm, and he eats and drinks next to nothing. He also pants a great deal while in the house or after running about for a short time. Please tell me what to do for him. 2d. Does the length of barrel increase the range of a rifle? Also tell me the length at which the range is greatest. 3d. Is a Wesson rifle .38 calibre heavy enough for deer? Ans. 1st. Your symptoms are rather indefinite, but we should give the dog a tablespoonful of cod liver oil twice a day for a while, and a tonic of quinine and iron. 2d. For ordinary shooting a barrel of .28 inches is sufficient; but for very long ranges—1,000 yards—where a very large charge of powder is to be burned, one of 30 or 32 inches is better. 3d. We should prefer a larger calibre.

JOHN A. N., Syracuse.—No, sir; soft crabs are not in season now. Crabs, like the terrapin, "hibernate" during the winter by collecting in large numbers in deep, muddy holes, where they will not be disturbed by floating ice. They have now left their winter homes, and have commenced to wander about in search of food. In May they shed their crustaceous covering, and continue to do so every month while the weather is warm. They are then called soft-shelled crabs, and may be classed among the most toothsome of human food. They never sell for less than from 75c. to $2.50 per dozen. By many the hard-shell crab is considered quite a delicacy, and sells readily in our city markets at from forty to fifty cents per dozen. At the bays and inlets where they are taken, they sell for eighty cents per hundred.

H. E. H., Branford, Conn.—There has been captured in a net set for whitefish in Long Island Sound several large trout—*Salmo fontinalis*. Trout of a large size—two pounds in weight—have been caught by myself in a stream connecting with the Sound, where until recently there have been no trout for six or seven years. These trout in the brook undoubtedly came from the Sound, which indicates their presence there in numbers more than a few. Is this a common occurrence—trout in salt water, at a distance of a mile from the shore? Ans. It is quite common to catch *Salmo fontinalis* in salt water a mile or five miles from shore. We recently received from the Smithsonian Institution an acknowledgement of the receipt of several specimens in alcohol of trout so caught in different localities, which we had sent thereto. Indeed, it is a mooted question between the best ichthyologists whether the sea trout, so called, is not in fact a *Salmo fontinalis*.

FOREST AND STREAM.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

Terms, Four Dollars a Year, Strictly in Advance.

Twenty-five per cent. off for Clubs of Three or more

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line; outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

*** Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, APRIL 19, 1877.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

☞ Trade supplied by American News Company.

CHARLES HALLOCK,
Editor and Business Manager.

DON'T YOU FORGET IT.

—On the 1st of May next the office of FOREST AND STREAM will be removed back to its original quarters, 103 Fulton Street.

WHAT IS THOUGHT OF FOREST AND STREAM.—*The Kind of Patrons we Have.*—Modesty won't hurt us, and so we print the following letters. The first is from J. U. Gregory, Naval Agent at Quebec, who prides himself upon having secured for FOREST AND STREAM a club of fifty subscribers among the leading gentlemen of that ancient city:

QUEBEC, April 12.

Editor Forest and Stream.

Please send the FOREST AND STREAM to His Excellency, Lord Dufferin, the Lt. Governor of the Province of Quebec, at Quebec. Our Lt. Governor is a keen sportsman, and I am glad to be able to add him to my long list of subscribers, which I hope to increase. Send him all the back numbers of the present volume. Yours, very truly,

J. U. GREGORY.

The second letter is from Dr. Elliott Coues, U. S. A., the well-known ornithologist, and we are bound to say that the compliment conveyed in it has more than ordinary significance; to have earned it or gained it gives us pleasure. It is the reward that follows persistent endeavor, lightening the burden of labor:

U. S. GEOLOGICAL SURVEY,
Washington, D. C., April 13, 1877.

My Dear Hallock.—Permit me to thank you for lending the columns of your paper to the purposes of my circular respecting the proposed "History of North American Mammals," as well as for the cordially appreciative expressions with which you were kind enough to preface it. The compliments which we receive should react less upon our self-love, and our self-satisfaction at anything we may have done, than upon our sense of the responsibility we incur in accepting them, and should make us strive to become less undeserving of the confidence our friends repose in us. It would be idle to pretend that we are indifferent to praise, as part of a reward for our labors; but praise finds its highest and truest office only when it serves as a stimulus to renewed exertion.

My circular, published as a "circular order" from the Surgeon-General's office, was addressed ostensibly and especially to medical officers of the Army, with whom I am united in the bonds of corps spirit and sympathy; but it was designed to have, and I trust it will have, a wider application; and I beg that each one of my friends, whether known or unknown, who may be interested in the matter, will consider himself individually invited to co operate with me in this work, in which I am very much in earnest. I do not know that anything else need be added to what is said in the circular itself, unless it be the reiteration with emphasis of the fact that I have much to learn before I can make the work all that I want it to be. I shall probably cause the circular to be reprinted in a number of papers; for you know that no one of us can claim any patent-right on the channels and methods of scientific inquiry. But I may truthfully say that I am particularly pleased to have it in FOREST AND STREAM, a journal so largely devoted to the increase and diffusion of information in Natural History, which reaches so large and so cultivated a circle of readers who are interested in pursuits like mine, and which seldom if ever reaches me without containing something that I immediately cut out and file for future use in my own writings. With renewed expression of my best wishes, which you know you have always had, for the continued success and increasing good influence of your very ably edited paper, believe me,

Yours cordially, ELLIOTT COUES.

A GLANCE AT THE INSECTS.

ABOVE the worms and crabs we rise into the world of insects, and find completed in them the jointed (articulate) plan in which they all agree. In this class the body is no longer a mere chain of rings like the worm's, nor is there a solid head-thorax as in the crab's; but we have a distinct head containing a larger brain than before seen, a separate chest or *thorax*, and behind it an abdomen. The body-wall of insect's becomes a hardened crust; but it is made up of a large number of pieces, so arranged that motion is not interfered with nor growth stopped. Each ring of the thorax bears a pair of legs. The leg consists of six points ending in a pair of claws, between which is a cushion-like sucker, an apparatus that enables the fly to walk on the ceiling. The great majority of insects have but three pairs of legs, and constitute the order of six-footed insects *(Hexapods)*; but the centipedes, because they have more rings in the thorax, have many more pairs of feet.

The wings of insects, consisting of two pairs, called the fore and hind pairs, are simply membranes stretched over a frame-work of many tubes. Through these tubes the blood circulates, and as they contain within them air tubes, the blood is here exposed to the air and recharged with oxygen. Thus the wings perform the office of lungs as well as flight. The blood is usually colorless.

The appendages of the head are more numerous and difficult to describe. The large prominent eyes are compound, that is, they are made up of many (50 to 3,650) simple eyes crowded together so that an insect can look in all directions at once, though he can neither move his eyes nor turn his head. From near the eyes spring two long, slender "feelers" called *antennæ*. They seem to be of use to the insect in directing his flight as well as finding his food, and some say that through them he can perceive sounds. On each side of the mouth you will find the stout jaws, or *mandibles*, with their sharp, three-toothed edges, shutting together sideways instead of up and down. With these insects cut and tear their food, passing it on to the more complicated *maxillæ* just behind the mouth for finer chewing. There are still other appendages to the head quite as important.

The muscles of insects lie just underneath the crust, and their power is enormous. A flea will leap 200 times its own height, and certain beetles will bear up as many times their own weight, while others are able to gnaw through lead pipes and iron canisters.

All insects breathe air, or air mixed with water, which enters through little holes along each side, a system of intricate tubes and valves called *tracheæ*, and is thus distributed all over the body. In many insects there are little sacs in various parts of the body which may be filled or emptied of air at will, thus increasing its weight. Some, however, when perfect, and others in their larva and pupa stages, have regular little gills by which they breathe. The way insects grow by *metamorphosis*, or the change of one form into another, is very curious—almost as much so as the alternate generations in the development of jelly-fish or *Salpa*. Take for example the history of the dragon-fly or "devil's darning-needle," that terror to all peaceful hummers and buzzers. In laying her eggs in July and August, the dragon-fly "alights upon water-plants, and, pushing the end of her body below the surface of the water, glues a bunch of eggs to the submerged stem or leaf. * * * There must be more than one hundred eggs in one of the large bunches." You can easily see this process if you are watchful, but you will ere long discover that not every fly that hovers over the water or alights near its surface is there to deposit eggs. The eggs soon hatch out little beings called *larvæ* (meaning a mask), which is the name given to the very first or youngest stage—the babyhood of all insects. "Caterpillars," "grubs," "canker-worms" and so forth are common names for the larvæ of moths and butterflies. All larvæ are perfect gluttons, spending their whole time in capturing and devouring their food. It is at this time in their life that such insects as live upon plants do so much damage to our crops and shade trees; for many of these terrible pests, when fully grown, are beneficial to us rather than injurious.

But to go back to our immature dragon-fly, actively plundering in the bottom of its native pool. It has much the shape of the adult, except that the abdomen is fatter and there are no wings worth mentioning. Instead of the formidable weapons we should expect to find about the mouth, there is only a broad, smooth mask covering the face. This looks innocent, certainly, but let some unwary insect come within striking distance, when quicker than flash the battery is unmasked, the terrible jaws dart out, and the victim is secured.

If now you should put some of these larvæ into an aquarium and watch them, you would observe that the skin would split along the back, through which rent the insect would literally crawl out of its skin. But now it is different from what it was before, and yet it is not a perfect dragon-fly. It has become the chrysalis or *pupa*, and although now considerably larger and nearer perfect than the larvæ, there is yet another change to come, and early in summer the pupa crawls up some plant close to the surface of the water to await it.

"Again the back yawns wide open, and from the rent our dragon-fly slowly emerges. For an hour or more it remains torpid and listless, with its flabby, soft wings remaining motionless. The fluids leave the surface, the crust hardens and dries, rich and varied tints appear, and our dragon-fly rises proudly into its new world of light and sunshine, a gorgeous but repulsive being." Before each of these changes took place the body of the next form had fully formed underneath the skin, so that we might say, as the larva hatched out of the egg, so the pupa hatched out of the larva, and the perfect insect or *imago* out of the pupa.

The natural classification of insects, Dr. Packard thinks, is the following:

CLASS.	*ORDERS.*
INSECTS.	HEXAPODA, Six-footed insects.
	ARACHNIDA, Spiders.
	MYRIOPODA, Centipedes.

The lowest of these orders, the myriopods, embraces the thousand-legged worms that scamper off so lively when you upturn a rotten log. They have from ten to two hundred rings, with a pair of legs to each ring, so it is no wonder that they get away pretty fast. The well-known and dreaded scorpion of the Gulf States, whose bite is dangerous, though not always fatal, stands just here next to the true spiders, which constitute the sub-order, *Araneina*, the web-makers.

The study of our spiders is extremely interesting, not only from the large number of species in this country and their varied localities and dress, but also from the astonishing instincts which they show, and the wonderful webs and pit-falls which they build in order to trap their prey:

"'Will you walk into my parlor?'
Said the spider to the fly;
'It's the prettiest little parlor,
That ever you did spy.'"

They all subsist upon what they kill, and destroy many insects which, if allowed to live, would do harm to our crops; moreover, we have no species in the Northern States whose bite is poisonous, so that there is less reason for our killing every spider that comes in our way than many other insects. I would advise you to read Mr. J. H. Emerton's article in the second volume of *The American Naturalist*, if you prefer reading how a spider builds its web to finding it out for yourself. Now I have only enough time to merely name the seven great groups of six-footed insects, to give you an idea of the extent of this great study of entomology. They are as follows:

1. The *Neuroptera*, including the dragon and May-flies and other low-forms.

2. The *Orthoptera*, or grasshoppers, crickets, locusts, etc., among which are some of the largest and noisiest of all our insects; and this noise is made by rubbing their peculiar wings together.

3. The *Hemiptera* "bugs" proper, like plant-lice, bed-bugs, and a great many small, compact forms found in the grass, all of which have mouths fitted for biting and sucking.

4. The *Coleoptera*, or beetles, which are perhaps the most interesting of all, and certainly the most numerous. You can find them anywhere in the woods, on trees, in the grass, in midst of the desert, and cast up by the ocean.

5. The *Diptera* you are familiar with as flies, but have you noticed the fact that the various kinds of flies that you see all agree in having but one pair of wings? Our common house-fly, the blue-bottle, and flesh-fly, with many others, belong to the family *Muscidæ*.

6. The *Lepidoptera*, gorgeous butterflies and moths, are the most striking of all the class. Butterflies are distinguished from moths by their antennæ being knobbed instead of thread-like or feathery. Most of our ordinary day-time butterflies belong to the *Papilionidæ*, but there are other equally abundant species, especially of moths that only fly at night. They lay their eggs in early summer, which are soon hatched by the heat; their changes are then rapidly passed through when they appear in sudden abundance. With some, like our little sulphur-yellow butterfly *(Colias)*, there are two broods in a season.

7. The *Hymenoptera* are the last and highest of insects, typified by the bees, wasps, and ants. And they deserve the highest place, for no chapter in natural history is more surprising than that which tells the story of their wonderful ways.

AMERICAN NEWS COMPANY.—This agency has, in a comparatively brief period, become one of the most potent and extensive institutions of the country. Its ramifications extend everywhere, and its usefulness is readily acknowledged by those who have been served by it. Probably in these days success could hardly attend any newspaper enterprise not having an immense capital and influence behind it, if it were not assisted and fostered by the American News Company. We have found the gentlemen who control it to be as impartial in their service to publishers, journalists, dealers, and others, as can be consistent with good judgment sagaciously exercised. It will astonish those who are cognizant of their small beginnings and upward struggles at the outset to make an inspection tour of their magnificent new buildings in Chambers Street. Such a complete system of accommodation and delivery has scarcely ever been developed as one finds there. The machinery is as complete as that of our post-office. We offer our feeble congratulations to those who have willingly helped to make us as strong as we are, and we trust and expect that *We* both will continue to grow together, live long and prosper.

—In the vicinity of Tampa they have corn waist high, and watermelons and other vines are in bloom.

—Kilt suits for Spring and Summer are displayed by Baldwin, the clothier, of New York and Brooklyn. His Boys' Department is the leading place of the kind in America. Prices from ten to twenty per cent. less than elsewhere.—*Exchange.*

IMPORTED BIRDS FOR OUR WOODS AND PARKS.

THE following letter, from one of the most prominent citizens of Canada, contains suggestions of great value, based upon a knowledge gathered from study and experience. It will command the attention of commissioners of public parks, farmers, bird fanciers and philanthropists:

EDITOR FOREST AND STREAM.

It is very interesting to me—Mr. Willicott's description of the way the English skylarks have been destroyed at Brooklyn, as it shows there is nothing in the climate of America which necessarily makes a dearth of birds, and, as a consequence, an increase of insects.

It will be difficult to establish larks, because they are valuable as songsters, for sale, and as an article of food; their method of singing will attract any gunner, and the bird is easily shot, but why should a partial success be given up? The great difficulty has been overcome, namely, that of climate. I would advise, as inhabitants of such splendid parks as there are in and about Brooklyn, the importation of blackbirds and starlings; these are local birds. The former will breed in the evergreen trees, and the latter among the houses, in chimneys, sparrow bones, water-spouts, etc. The bird we want is one which will work all the year and remove from the ground the nests of insects injurious to agriculture.

I have tried blackbirds at Quebec; they did very well, but the birds gradually got into cages and were sold, and as this was done by gentlemen, I was disgusted. I do not, however, see why the importation of birds should be given up.

As an encouragement to importers of birds, I claim to have imported sparrows into America at Portland, Maine, in 1854, and I had to import them three times at Quebec before they took root. The two first importations were secret; to the latter I gave the utmost publicity, and the last course was the successful one. The principle to adopt is to select a bird that can take care of himself in such a crowd as there is in the old world, and who will be on the ground for the whole year, working after insects for his food and our benefit, and singing to make our hearts feel happy. Surely such an object is worth paying for! and it is the only way I know of to meet the ravages of insects injurious to agriculture.

I imagine no live Yankee would wish to be now without the life and animation of the house sparrow in his great cities. They are like gas in a town—a sign of progress. I admit the bird is a little blackguard, fond of low society, and full of fight, stealing, and love-making; but he is death on insects, fond of citizen life, and in every way suitable to be an inhabitant of the new world. He certainly is a great attraction to an American city in the eyes of a traveller, as he shows there must be some kind hearts somewhere, or else the poor sparrow would not be so pert and happy.

Blackbirds had better be brought by the nestfull, so as to get cocks and hens. Starlings can be caught in the spring by using bird lime. Yours, W. RHODES.

Quebec, Canada, April 7, 1877.

A GIGANTIC STAR FISH.—Libbey's Oyster Bay in Fulton Street is as well known to the respectable down-town business men of New York as any similar refectory. The quiet, unassuming manner of the proprietor—always obliging but never demonstrative—has won for him an honorable esteem and worthy patronage, which we trust has long since provided for him an easy and comfortable journey down the decline of life. Those who enter the refectory are always served with the best selected chops, shell-fish and oysters, while there is always a goodly display of baskets and barrels of the luscious bivalves at the portals outside. Last Christmas time Mr. Libbey commemorated the holidays in the usual way by making his place attractive with evergreens; and it so happens that he has permitted a five-fingered star, some two feet in diameter, such as is fabricated from the "running pine," to hang outside ever since, conspicuously among the oysters, clams, lobsters and soft-shell crabs. The point of our approach is this once bright particular star, though now faded to a pale indefinite green, much like the color of the seaweed that clings to an old spile, or, as the poem has it, "like the sea-weed on a clam." The other day a rural visitor who had already passed some interesting hours at the aquarium up town, chanced to pass the hostelry in Fulton Street, and saw this time-worn relic hanging as has been described. Among other marine curiosities at the aquarium he had been particularly interested in the tank of star-fish, or "five fingers," which he had been told were very destructive to oysters; and when he saw this star of Libbey's stretching its hugh proportions before him, he paused in amazement.

"Gosh! what a whopper!" he exclaimed. "Why, that beats any of them up to that aquarium clear out of sight!" And then he sauntered on, musing thoughtfully. A person who overheard him had to tell the joke, and that is how we came to know it all. Mr. Libbey himself recognizes the resemblance, and admits that it is certainly the biggest star-fish he ever saw.

DEATH OF THADDEUS NORRIS, ESQ.—Thaddeus Norris is dead. "Uncle Thad" has gone to his last fishing ground. Poor Yorick! we knew him well. A column of obituary notice would not suffice to hint at his worth, nor a column of granite lift its head sufficiently high to do him honor. He was a valuable contributor to FOREST AND STREAM from the beginning. The Philadelphia *Inquirer* says:

"Thaddeus Norris, Sr., a well known resident and retired merchant of this city, died suddenly, at half-past one o'clock yesterday morning, at his residence, 208 West Logan Square. For about a year prior to his death he had been suffering from paralysis of the brain, superinduced by exposure while pursuing his favorite pastime and study of angling and fish, but no immediate danger was at any time apprehended from his disease—not even a few hours before his sudden decease, when he busied himself preparing flies for a friend. He was born August 15, 1811, at Warrenton, Va., received a common-school education at Wheeling, came to this city when quite young, and opened trade in general merchandise. He continued a successful business there and in branch houses at New Orleans and Memphis until the outbreak of the civil war, when he retired from trade and turned his whole attention to the subject of fish—their nature, habits, culture and capture—which had been the delight of his boyhood and of leisure hours during his long mercantile life. He was the author of "The American Angler," first published about twelve years ago, and of "American Fish Culture," which appeared later. Both are exhaustive works, and have been regarded as standard authorities on the subjects of which they treat. Mr. Norris was also a frequent contributor of serial articles upon his favorite themes to such magazines as Harper's and Scribner's, and a valuable member of the Academy of Natural Sciences. Being a good amateur mechanic, he manufactured all his fishing apparatus, and so great was the virtue attached to a rod, reel or net made by 'Thad' Norris, that anglers have been known to offer many times its value in order to possess it. Mr Norris always took pleasure in imparting piscatorial knowledge to friend or stranger, if he found him apt and desirous of promoting the study of fish. He made a specialty of trout, and was the first to have specimens of that fish hatched in this city. Notwithstanding his penchant for fishing and fish, he abhorred the idea of being regarded as a sportsman, in the ordinary sense of that term, and was a relentless foe to pigeon-shooting and kindred 'sports.' Whenever a fish preserve in any part of the country was visited by Thaddeus Norris, the owner thereof took good care to advertise the fact as widely as possible."

GAME PROTECTION.

NEW HAMPSHIRE.—The annual meeting of the Fish and Game League of New Hampshire, was held in Manchester on the 3d inst. The following officers were elected: John B. Clark, President; W. W. Colburn, Secretary; Frederick Smyth, Treasurer; Marcellus Eldridge, Portsmouth; Luther C. Critchett, Strafford; G. V. Pickering, Laconia; William C. Fox, Woolfborough; Eldridge F. Perkins, Wilton; Burns W. Pittee, Enfield; Nathan R. Perkins, Jefferson; W. W. Fletcher, Concord; John Clement, Troy; William Jarvis, Claremont, Vice-Presidents.

The committee on fisheries reported that the new fishery at Lawrence would answer the purpose for which it was designed, although a test was yet to be made. A committee of five was appointed to consider what changes may be necessary in the game laws, and to secure them from the Legislature. Mr. Brockett, Fish Commissioner of Massachusetts, delivered an interesting discourse on the subject of fish culture, giving some account of what had been done in that State. Gen. John McNiel of Manchester followed with some remarks corroborative of Mr. Brockett's statements. In the afternoon Dr. Edward Spaulding of Nashua delivered an address on the subject of restocking the Merrimack River with immigratory fish.

—"The Hallock Sportsman's Association has just been organized at Glen's Falls with the following officers: President, A. N. Cheny; First Vice-President, Walter McDonald; Second Vice-President, F. E. Ranger; Secretary, Chas. H. Fennel; Treasurer, Geo. R. Harris; Counsel, H. A. Howard, Esq.; Board of Managers, D. P. Smith, A. H. Fennel, A. B. Abbott, J. R. Burnham, John W. Knight, Geo. W. Conkey, M. R. Peck.

We feel much honored by this evidence of the fraternal esteem so often extended to the Managing Editor of FOREST AND STREAM, and shall take an especial and lasting interest in the prosperity and well-doing of this club.

—The Sportsmen's Association, of Danville, N. Y., is doing considerable good in stocking the streams of the vicinity with trout, and putting out grouse for breeding.

—Alabama has a new game law which prohibits the killing of any kind of game between April 14 and October 1. The killing of wild ducks at night, or with the aid of floats, blinds, or other devices, at any season of the year, is prohibited.

A most excellent law—brief, and sufficiently to the point!

MARLBORO, N. J., April 11, 1877.

EDITOR FOREST AND STREAM.

Received box of Florida quail to-day from Mr. Chas. F. Price of New York city, containing one hundred birds, seventy-five of which were dead. Mr. Price has been wintering in the South for the benefit of his health enjoying himself with the rod and gun. The coop was about four feet long by three wide, and one foot high. There were no partitions to keep the birds from massing and thereby trampling each other under foot. Many of them were injured about the head, caused I suppose by the box being too high, giving them room to fly up and bruise their heads. The feed, which was oats, was placed in a flat box in one corner, and it soon became in such a filthy condition that the birds would not eat it, and I think many of them were starved to death. I gave the surviving ones wheat and water, and they ate and drank freely. Will turn out upon my plantation in pairs, male and female, as near as possible. I think you have frequently given instructions through your paper for the shipment and boxing care on transit of quail, etc., for restocking purposes, and yet it appears to me they will bare repetition, as few seem to understand it, thereby causing an unnecessary loss and expense. These quail were sent up on one of the Charleston steamers, and if a proper place had been arranged for feeding and watering them, I feel sa isfied a very few of them would have perished. I have my doubts whether Southern quail will do as well North as Western birds. I am inclined to think they will not, yet I believe those turned out by the West Jersey Society, from North Carolina, have done very well.

WM. J. CONOVER.

FOREST FIRES.—In Ulster County and other localities in this State the annual forest fires are raging south of the snow line, much damage having already been done to buildings as well as cut and standing timber. Fires have broken out at half a dozen places on Long Island, between South Oyster Bay and Patchogue. The long continued drouth has made everything very dry, and fires take easily from slightest causes.

FLORIDA ITEMS.—Rattlesnakes are unusually numerous around St. Augustine this spring.

The Micklers who hunt venison for the tables of the St. Augustine (Fla.) hotels were still at their business on April 7th. They have caught several fawns alive recently.

An alligator, measuring 8 ft. 6 in. in length, was killed by Capt. Pratt, from off the Battery, opposite the Fort. It was carried within the Fort, much to the amusement of the Indians.

The season is fast drawing to a close, and our Northern visitors are leaving in large numbers.

—Little Johnny is quite sure the picture of a Spitz dog he drew on the parlor wall was good, because it made his father mad.

New Publications

THE TWO AMERICAS. By Sir Rose Lambert Price, Bart. Philadelphia: J. B. Lippincott & Co.

From England *via* Madeira and St. Vincent to Brazil; thence down the coast, through the straits, and up the western coast of California; thence across the continent and home again; on the sea a guest of the commander of one of H. M.'s ships, and on the land feasted by all the clubs from Rio Janerio to New York. This was a trip fit for an English lord or king. Such was the route taken by Lord Price and described in his book. Some of the more entertaining of its pages are those describing the game and fish which were met on the way. The author fished at Madeira and St. Vincent, stalked guanaco in Patagonia, shot ducks in the Straits of Magellan, tortalita in Chili, partridges in Peru, wild fowl in Mexico, and fished for salmon in the McLeod River. An interesting feature, too, is the insight afforded into the parlance of an English lord. By this we must confess we were at first puzzled. Only by adopting the method of a well-known college professor, famous for explaining the text by the context, did we discover that when the author's "screw" was "pumped," we were to understand that his horse was tired out. Lord Price also made some interesting discoveries of a like nature among us. He says: "I found that several English words in America had rather peculiar signification; sportsman, for instance, means black-leg."

THE GREAT WEST AND THE PACIFIC COAST. By Gen. James F. Rusling. New York: Sheldon & Co.

This book is the record of a tour of inspection made by the author some years ago among the military posts of the West. Gen. Rusling's mission took him over a wide territory, much of it removed from the ordinary lines of travel, and his official position gave him unusual opportunities for observation. The trip also possesses additional interest as one of the last ever made in the old-time way of stage coaches and ambulances. Of the 15,000 miles traveled, over 2,000 were by stage coach and 3 000 by ambulance or on horseback. The author's pictures of persons, places and things are always lively and interesting, told in language admirably adapted to the subject, and with a refreshing absence of that first personal pronoun whose obtrusive presence has marred so many books of travel. The Indians, Chinese and Mormons have each their chapter, the last valuable as containing the views of one well qualified to give an opinion upon the subject. Down in Arizona Gen. Rusling came across a veritable sleeping town, of which he gives a charming description, and a few miles further on is the famous church of San Xavier Del Bac, whose frescoes and Spanish chimes, long since deserted by the Jesuits, are now guarded by the superstition of a squalid tribe of Indians. This church, by the way, is but one link in a long chain of ruins extending from Florida to California, all eloquent in their story of Spanish conquest and subsequent desertion. Here is an excellent field for some of our young writers, which will amply repay research, and which we hope to see developed.

"THE PRACTICAL KENNEL GUIDE." By Gordon Stables, M. D. C. M. R. N. Cassell, Petter & Galpin, London, Paris, and New York.

Those of our readers who receive the *Fancier's Gazette* will be familiar with the writings of Dr. Stables, a gentleman whom we take to be an authority across the water on all subjects pertaining to the dog, as well as other domestic animals. His present work is unique in one respect, in that he goes into details connected with dogs in a manner different from that of any other publication on a similar topic. For instance, we are taken, as it were, inside of the judging ring and instructed upon the general management of show dogs; how to get them into health and condition, and prepare them for the ordeal. We are also taught all the terms used by fanciers, and the tricks resorted to to deceive judges. The book contains also the Bench Show points for every variety of dog, and the why and wherefore of these points. We can recommend the book as a most valuable and interesting one to the breeder and exhibitor.

AMERICAN PARTRIDGE AND PHEASANT SHOOTING. By Frank Schley. Baughman Bros., Frederick, Md.

We must give credit to Mr. Schley, mainly for not having undertaken to cover too much ground in his book. The idea of taking one or two families of game birds, and going thoroughly into their habits, etc., is an excellent one. In the main the book is a compilation from "Baird, Brewer, and Ridgway," and other works, and the appendix, relating to dogs, is taken (with due credit, of course,) from Mr. Arnold Burges' "American Kennel and Sporting Field." Mr. Schley will find but few persons to agree with him that Mr. Burges on sporting dogs is what Baird, Brower, and Ridgway are on birds, and that his opinions are entitled to the like respect. In the main, however, the book is correct, and will undoubtedly, as admitting of ready reference, be a valuable addition to the sportsman's library.

"HOW TO CAMP OUT." By John M. Gould. Scribner, Armstrong & Co., New York.

We are in one respect indebted to Mr. Gould for his interesting little book, for it will, or should, save us the trouble of replying to innumerable questions. The young camper out will here find all the information he wants as to detail of properly preparing a camp, as well as excellent advice as to walking, etc. A chapter from Dr. Coues's "Field Ornithology" supplies some capital hygienic notes, which are very well placed in a book of this description.

IMPORTANT WORK FOR SPORTSMEN.—H. C. Woodman and T. F. Rose are now engaged in preparing a historical and biographical atlas of the coast of New Jersey, from Sandy Hook to Cape May, extending inland ten miles. It will be of great benefit to sportsmen, locating every bar, marsh, inlet, and bay, with their resources as per fishing and gunning; also means of access and accommodations.

CONSUMPTION CURED.—An old physician retired from active practice having had placed in his hands by an East Indian missionary the formula of a simple vegetable remedy for the speedy and permanent cure of Consumption, Bronchitis, Catarrh, Asthma, and all Throat and Lung affections, also a positive and radical cure for Nervous Debility and all nervous complaints, after having thoroughly tested its wonderful curative powers in thousands of cases, feels it his duty to make it known to his suffering fellows. Actuated by this motive, and a conscientious desire to relieve human suffering, he will send, free of charge, to all who desire it, this recipe, with full directions for preparing and successfully using. Sent by return mail by addressing with stamp, naming this paper, Dr. J. C. STONE, 32 North Fifth Street, Philadelphia, Pa.—*Adv.*

SAVANNAH, ST. AUGUSTINE AND NASSAU.—Murray, Ferris & Co.'s enterprise of running a steamer from Savannah to Nassau, via St Augustine, has proven successful, and the line and connections will be kept up next season. There has been less difficulty in crossing the St. Augustine bar than was anticipated.

Rifle.

CREEDMOOR.—The season at Creedmoor was fairly opened on Saturday last by the contest for the Remington $300 gold coin prize. There were twelve contestants, most of them old "team" men, but the scores made were far away from usual form. Some said it was want of work, and some said it was the ammunition. Probably both had something to do with it, and the next match will tell a different story. The conditions were: Open to all comers; weapon, any Remington breech-loader, to be loaded at the breech, with cartridges supplied by the company; distance, 900 and 1,000 yards; 20 scoring, without sighting shots; entrance fee, $2. The following are the scores; possible score 200:

Name.	900 yards.	1,000 yards.	Total.
T. L. Allen	81	78	159
Thomas Lamb	82	77	159
L. Weber	81	75	156
T. S. Dakin	79	59	138
C. E. Blydenburgh	78	57	135
H. S. Jewell	62	67	129
G. L. Morse	65	60	125
E. H. Raymond	54	70	124
C. Sharp	52	59	111
E. H. Sanford	51	56	107
Hosmer Fisher	25	49	74
N. Washburn	62	retired.	—

NEW YORK.—The Sixth Division Rifle Association will hold its spring meeting on June 6th and following days. Many improvements are to be made in the range. The markers' butts will be raised, as will also the targets. The ground at the 200, 500 and 1,000 yard firing points will be also raised eighteen inches or two feet, and a shed will be built at each of these points on the side of the range for use at the spring and fall meeting. The Association offer $200 in cash prizes, in addition to such as the prize committee shall be able to secure from volunteer sources.

AMATEUR RIFLE CLUB.—The attention of members is respectfully called to the following resolution, adopted at the annual meeting of this Club:

"*Resolved*, That eight weekly competitions be held at Creedmoor, on such days as may be designated by the Executive Committee, open to all members of the Club; distances 800, 900, and 1,000 yards; 15 shots each distance; any rifle. No sighting shots, previous practice on day of match, or coaching allowed. Entrance fee, fifty cents each match. That the eight men making the highest average in any six of such competitions constitute the senior team of the Club, and the next eight the junior team, who shall represent the Club in any challenge it may receive, and that the person making the highest average in such competitions be awarded a suitable badge."

The matches will take place on Tuesdays, April 17th, and 24th; May 1st, 8th, 15th, 22d, and 29th, and June 5th. Shooting to begin at 10:30 A. M.

N. B.—Railroad Tickets at reduced rates may be procured at office of National Rifle Association.

CONLIN'S BENEFIT TOURNAMENT.—This tournament has been in progress for the past four weeks with marked success, there having been shot nearly 500 tickets. The prizes are the gifts of his personal friends and patrons, and are valued in the aggregate at over $250. The following comprise the list of trophies thus far received: one Japanese cabinet, presented by the Zettler Rifle Association; one valuable gold medal, presented by William Hayes; two fine opera glasses, presented by the Arnold & Constable Rifle Club; one inlaid ardito stereoscope, presented by James Molinari; one fine engraved revolver, gold and silver plated, large size, presented by Henry Fulton; one magazine revolver, new style, presented by E. Remington & Son; one gold and silver plated revolver, large size, presented by Schuyler, Hartley & Graham; one fine trout rod, presented by H. D. Blydenburgh; one fine nickel-plated revolver, presented by E. S. Harris; one box fine cigars, presented by Sandy Spencer; three gold-plated medals, five silver-plated medals, 15 bronze medals, presented by L. V. Sone, J. D. Blydenburg, C. A. Cheever, C. E. Blydenburg, the total number being thirty-four, thus insuring to every marksman of average skill a beautiful trophy, as no one competitor can receive more than one, but is privileged to shoot as many tickets as he desires, his best target only being taken into account. This tournament closes on Saturday, April 21, and it is therefore hoped, in view of the uniformly courteous treatment which all have received at the hands of Mr. Conlin, that those who have not availed themselves of the opportunity to help him refit his new gallery will ow step to the front and lend their aid by purchasing tickets according to their ability.

The tickets are fifty cents each, and can be had at the Zettler Rifle Gallery, 207 Bowery, where the tournament is being held, or by applying to any member of the committee: L. V. Sone, M. L. Riggs, C. A. Cheever, D. L. Beckwith, C. G. Zettler, J. D. Blydenburg, B. Fenning, C. E. Blydenburg, post-office box 5529.

CONLIN'S GALLERY.—Judging from the present "outlook" the new place will be even a more popular resort for riflemen than the last one, which was destroyed by fire on the 11th of last March. Mr. Conlin's gallery is now located at 1,222 Broadway, and besides having "A. No. 1" firearms and perfect arrangements, two new features have been added. During the day-time the marksmen can shoot in either natural or artificial light, an advantage which no other gallery in the city possesses.

A nicely furnished apartment has been added to the establishment, to be used as both a "sitting" and a club room; here the patrons and their friends can find all the sporting papers, FOREST AND STREAM included. This room is offered to all shooting clubs for their meetings, etc., free of charge. Last Thursday evening, April 12th, was the "opening night." The attendance was large, and the shooting was kept up till a late hour.

The following are a few of the scores made during the evening: C. E. Blydenburg, 48; M. L. Riggs, 47; J. B. Blydenburg, 47; Charles A. Cheever, 46; B. Zettler, 45; W. R. Brown, 41; L. V. Sone, 41; W. H. Smith, 41; L. C. Bruce, 40; J. F. Murch, 40; T. E. Marshall, 38; H. A. Berrien, 38; Paul D. Chillian, 37; B. O. Brown, 37; P. R. Murray, 37; T. C. Banks, 36; H. R. Trayson, 36; D. F. Lebrun, 36; and many others too numerous to mention. As everything was new and strange to the shooters, the scores are good. Mr. Conlin's first gallery was in Barnum's American Museum. On the total destruction of this noted show-house, he was minus a rifle range. On the erection of Barnum's new museum, his second gallery was built; another fire came along and ended its existence.

The next attempt was made at Wood's Museum, when first opened; from there the gallery was moved to the southwest corner Broadway and Twenty-second Street; on the expiration of the lease of the building, a removal was made to 930 Broadway, where "Conlin's Gallery" became noted throughout the country for its superior arrangements, excellent firearms, large collection of shooting records, and as the headquarters for the long-range riflemen. But the work of years was carried away by the old enemy, fire, in a few minutes. Besides the above mentioned galleries, numerous branches have been started. All of these changes have given Mr. Conlin considerable experience in "fitting up" and "running" galleries, and he has used it to an advantage in building his present place.

MILEY'S GALLERY.—The Creedmoor tourney at Miley's Range, Brooklyn, terminated on Saturday night, April 14th, in the success of Messrs. Dougherty and Castner as the winners of the first and second prizes. The contest was very close toward the last, as the appended scores show: W. H. Doughterty, 291; E. B. Castner, 290; W. Lilliston, 289; A. S. Swan, 286; F. P. Pike, 279; A. H. Anderson, 274.

Among those present at the close of the match were E. R. Darveau, R. H. Campbell, E. F. Smith, A. S. Swan, H. Castner, F. P. Pike, and a number of gentlemen who take an interest in rifle shooting. The points made were out of a possible 50, and the aggregate out of a possible 300.

CALIFORNIA.—The *Pacific Life* prints an appeal to the National Guardsmen of the State to organize a team to visit Creedmoor this summer, to compete in the inter-State rifle match for the bronze statue (The Soldier of Marathon) donated by the State of New York. It is advocated that the scores made at the semi-annual meetings in California show a higher average than those made at Creedmoor, the climate giving the advantage of practice all the year round. It is further claimed that San Francisco can show the best military marksmen in the United States. A match in which teams from California and Nevada were pitted against the best men in New York and other States on the same ground would be productive of great interest, and we trust that the wealthy men of California will furnish the "sinews of war" necessary to bring a team from the Pacific slope.

CANADA.—The Dominion of Canada Rifle Association has issued a report of its annual meeting held at Ottawa in February last. Among the most important items of business transacted was the appointing a committee to revise the rules and by-laws; also that the Wimbledon Team be selected in future by competition in the different provinces under rules to be established by the council. In future the provinces of Manitoba and British Columbia will each be entitled to send one member of the Wimbledon Team under certain restrictions. The Association has provided for affiliating with it Provincial Associations upon their subscribing not less than $40, and any other Dominion Associations upon the payment of $20, each to be entitled to a number of memberships. Each affiliating association receives a silver medal for competition, the winner of which shall be entitled to compete once for the Prince of Wales' prize of £100 and badge at the first meeting of the N. R. A., at which he may be able to attend.

RIFLE ASSOCIATION OF FRANCE.—A correspondent asked us recently for some information regarding the Rifle Association of France. The following extract from the London *Volunteer Service Gazette* will throw some light on the subject:

We have received a courteous letter, addressed by M. Langer, the President of the Havre de Grace Rifle Association (La Société Havraise de Tir), inviting all members of Rifle Associations in France and of "friendly countries" (des pays amis) to the meeting at Havre at Whitsuntide. The programme is not yet published, but we are told that it will include prizes to the value of 10,000 francs (£400), distributed amongst all sorts of weapons, from the saloon rifle and the revolver up to military rifles; and it is confidently asserted that every marksman, even of moderate skill, is sure to carry off a souvenir of the meeting. The remembrance of the great courtesy with which the English riflemen were received at Havre two or three years ago will probably induce some of our riflemen to join in these pleasant gatherings, though their doing so *as Volunteers* is now wisely prohibited.

—From a history of the English Rifle Brigade just published, it seems that when the "corps of riflemen" was first formed in 1800, a committee of field officers assembled at Woolwich to select a rifle. The principal gun-makers of England were invited to attend, and several rifles from foreign countries were also experimented with. The weapon eventually selected was one made by Ezekiel Baker, a London maker. It was 2 ft. 6 in. long in the barrel, grooved with a quarter turn; it had a flint lock. It was only sighted up to 100 yards. A triangular sword bayonet, 17 inches long in the blade, was fastened by a spring. The inventor boasted that at 200 yards 22 out of 34 shots struck the representation of a man.

What would he think now if he could see the shooting done with breech-loaders at a thousand yards?

UNACCOUNTABLES.

TORONTO, March 17, 1877.

EDITOR FOREST AND STREAM.

Your issue of 15th March contains an article on "Unaccountable Misses with the Rifle." Those Creedmoor rifles are cut so very fine that the ball will pass over the rifling without taking the twist or turning; the rifling is neither more nor less than a screw, and every machinist knows what stripping the thread means. I have been making and shooting with rifles for fifty years, take a great delight in the rifle, and am a machinist to boot, so I have had some experience with rifles. The breech loader should be cleaned out every shot, particularly if you use a paper patch. There is always a crust of burned powder at the breech which the ball must pass over. If it is not cleaned out, it will tear the paper off the ball. It should be taken off with water and a hair brush. Oil is not so good, as it will glaze the crust and pass over it, while water will dissolve it at once. The rifle then wants to be cleaned out with a clean, dry rag, and there should be no oil or grease of any kind used. A muzzle-loader is quite a different rifle, and does not require to be cleaned, as the ball never passes over that crust, but is only shoved down to it. Then there is the thin paper wad, which is shoved down the barrel before the ball, and takes down all the burned refuse from the powder, and the next shot carries it off again; also can be used with all those hunting rifles, as they are deeply cut, and their is no danger of stripping the rifling. I have both a Remington 40-calibre and a Sharpe 40-calibre. I use eighty grains of powder for each. When the shells are new they are too small for the ball to go in, and are very apt to destroy the paper patch, and I swedge them out before using; then I can shove the ball down to the powder without crushing the powder. I weigh the powder as carefully as I can, and for all that the shells are not equally full, and when the balls are loose they go down to the powder without crushing. My Sharpe is that loose that the balls would fall out of the shells, and nothing can shoot better. I know this by actual experience, and was often puzzled about my bad shots, but a little study convinced me that it was the ball smashing over the rifling, which was too slippery with oil, and it would soon wear the rifling out. The finer and shallower a rifle is cut the better it will shoot, and a hardened ball with nice, clean paper, like the rifling—well, such rifles as the Maynard hunting rifle, must have soft lead, as the ball has to cut its way into the rifling. Hoping I have said nothing to do any harm, if it does no good,

Yours, respectfully, TORONTO.

FLAT TRAJECTORIES.

LAUNDALE, Ill., March 26, 1877.

EDITOR FOREST AND STREAM.

I noticed in a recent number of FOREST AND STREAM an extract from Col. Dodge's work about "Hunting Rifles," in which he says, "The best rifle I ever owned was a muzzle-loader, which would throw a ball two hundred yards without cutting the line of sight, *i. e.*, the bullet had a perfectly flat trajectory." He says, "I drew the same sight at two hundred yards that I did at ten paces." It seems strange to me that a man of Col. Dodge's reputation and education should make such a statement. He evidently knows nothing about gravitation, or he assumes that no one will read his works who does, otherwise he would not have made such a statement, for any man knows it to be utterly impossible to shoot a rifle ball two hundred, or even fifty yards, without the bullet "cutting the line of sight." If Col. Dodge would read up a little, he would easily learn that a falling body will drop sixteen feet in one second; also that a bullet, no matter what its velocity may be, will drop sixteen feet the first second that elapses after it leaves the muzzle of the gun. The earth has the same affinity for a body in a rapid, horizontal motion which it has for one that falls from a height.

The initial velocity of powder is estimated by some to be seven thousand feet per second. Admitting that the Cole gun throws a bullet at the rate of seven thousand feet per second for one second, it would fall sixteen feet, but he shot two hundred yards, a little more than one-twelfth of seven thousand feet; one-twelfth of sixteen feet is one and one-thirteenth feet the bullet would fall in traversing that distance. But the initial velocity of a bullet is not one thousand six hundred feet per second, and ere one-half second is passed, not over one thousand feet per second. If his gun throws a ball two hundred yards at one thousand six hundred feet per second, it would have been in the air six sixteenths of a second, consequently it fell six feet. But a bullet does not retain its initial velocity; *i. e.*, its velocity constantly decreases. The bullet falls at the ratio of one, three, five, etc., for one, two, three seconds; sixteen feet the first, forty-eight feet the second, eighty feet the third second, and so on. At that rate, it of course falls faster the second or third sixteenth of a second than it does the first sixteenth. This proves that Col. Dodge's bullet must have cut the line of sight in its flight of two hundred yards. My opinion is, that he or any other cannot draw as fine a *bead* on an object at two hundred yards as at ten yards, and a hair's-breadth difference on the bead will make a difference of six inches in the shot at two hundred yards. Let any man try sighting at a mark near by, say ten steps, then off two hundred yards, with open sights, and I think he will soon satisfy himself. If his rifle threw a ball two hundred yards without cutting the line of sight, it would as well have gone two thousand yards, for to make a flight of two hundred yards level it must not consume any time, and it can traverse around the world as well as two hundred yards at that rate, provided the propelling force were great enough. I think Col. Dodge's advice of shooting with both eyes open is good. I have done considerable rifle shooting at game and at target, and as a rule use both eyes, as the Colonel says, one to look at the target with, and one to see my sight with. Hoping this may meet the eye of Col. Dodge, I am yours, sportingly,

C. M. SUTLIFF, M. D.

—The mean mid-day temperature at New Smyrna, Florida, for the month of March, as furnished by our correspondent, Major Geo. J. Alden, was 68 degrees; at 7 A. M. 58 degrees; at 9 P. M. 66 degrees.

Game Bag and Gun.

GAME IN SEASON IN APRIL.

Wild Ducks, Brant, Geese, Etc.

—Honk! honk!! honk!!! Here they come again, and from nearly the same old spot. Our friend C. DuBois Wagstaff came up to the city to-day with a face as red as a full-blown peony—the result of a week's goose shooting at Atlanticville. The result to us was a brace of the aforesaid geese, for which we return our thanks. Atlanticville is situated at the head of Shinnecock Bay, and the gunners, under whose guidance Mr. Wagstaff made his bag of sixty-two geese, were Washington Howell and John and Tuttle Carter, who have a capital rig, and will be found able and obliging by all sportsmen. The best day's bag was twenty-five birds—that is, geese, for ducks were not counted.

NEW YORK.—At a meeting held on the 4th inst. at the Orchard House, 933 Third Avenue, a party of sportsmen organized themselves into a Club, to be called the South Brooklyn Sportsmen's Club. The following gentlemen were elected as officers: Gus Boyen, President; John Bowie, Jr., Vice-President; Paul A. Bassinger, Secretary; Aaron Wittman, Treasurer. The object of the Club is hunting and fishing. SPORTSMAN.

NEW JERSEY.—*Kinsey's Ashley House, Barnegat Inlet, N. J., April 8th.*—Some thousand geese have been feeding in the cove in front of this place, and afforded capital sport during the past week, some sixty head having been shot. Brant have been plenty until Friday and Saturday last, when they took their northern flight. Very few are left, and the geese will soon follow. B.

PENNSYLVANIA.—*Pottsville, April* 16, 1877.—A number of fishermen from town have been out trolling our mountain streams for trout, some having been very successful, while others report that the "spreckles" are very scarce this season, though we think it very early to form any opinion.

A couple of "crack sports" went through a stream toward the the lower end of the county one day last week and caught 86 trout; the largest was over eight inches long; others say they have caught as high as 50 and 60 in a day. We think that successful fishing, like all other gaming sports, depends very much upon the natural instincts of the individual.

Another fisherman, one night last week, having had two hoop-nets set in the mouth of one of our silvery streams which empties into a large dam, reports two splendid "hauls;" one net contained 186 good sized cat-fish, and the other contained 75 chubs and 10 eels. DOM PEDRO.

DISTRICT COLUMBIA.—*Washington, April 15th.*—Ducks are reported to be more numerous on the Lower Potomac now than at any time since last fall, and they are affording excellent sport to those fond of aquatic shooting, though they are not so plentiful as they were many years ago in the Chesapeake, when the hands employed at an iron forge at Havre de Grace, once upon a time, refused to work because they were fed on canvass-back ducks instead of bacon. B.

VIRGINIA—*Norfolk, April 10th.*—One morning last week a magnificent flight of swans passed over. It was, indeed, a pretty sight to see the early morning sunbeams gilding the pure white feathers that shone out in their matchless purity from the azure background above. Snipe shooting still in order. This storm ought to bring more around. Some rousing big bass and drum in market last week, James River sending down its quota of sturgeon. W. H. S.

SOUTH CAROLINA.—*Port Royal, April* 11.—I wrote under date of March 23d that warm weather was promised. I was mistaken, as we are getting the exact converse. Fierce gales and heavy rain storms have prevailed up to this day, and we have, in fact, the latest kind of a late season. Overcoats are still in demand, and vegetation is backward. Bay snipe are scarce. It has been too windy for them to move about. R.

GEORGIA.—*Macon, April 8th.*—This afternoon a hurricane of rain, hail, and wind unroofed houses and tore up trees in the twinkling of an eye. The thunder and lightning was terrific. The wind brought into the city thousands of wild ducks, which are supposed to have been driven from the coast, some hundred and fifty miles distant. They must have made that journey in about half an hour, and when they struck the buildings head first, many had broken necks and were easily caught after the storm. A large number of grasshoppers, big ones, were also brought in by the wind. Altogether it was a scene the like of which I never expect to witness again. B.

FLORIDA.—*St. Augustine, April 10th.*—The season just closing has been a successful one in every respect. The hunting and fishing was never better. In less than two months over 600 English snipe have been shot, besides the vast numbers of quail. Drum fish weighing seventy pounds and upwards have been caught – the sheepshead, bass, etc., in abundance. TIM.

MASSACHUSETTS.—*Salem, April 16th.*—A pigeon shoot recently occurred between C. W. Jones and R. L. Newcomb, 10 birds each, New York rules, 21 yards rise, ground traps, with the following result:

Name.										Total.
C. W. Jones	0	0	1	1	0	0	1	0	1	0—4
R. L. Newcomb	1	1	1	0	1	0	1	1	1	0—7

There was considerable interest excited by this match. There was also a sweepstake shoot by a dozen others, but the affair of the day was the first match. TEAL.

SIZES OF SHOT.—A Philadelphia correspondent writes that Thomas Spark's Philadelphia drop shot, number six, containing 267 pellets per ounce, comes the nearest to the New Castle chilled shot, the difference being only three pellets, the chilled containing 270 pellets to the ounce.

—In our notice of the proposed removal of J. Walker & Sons, in our last issue, the types made us say that this firm would remove from 55 Dey Street to 14 *Spruce*, whereas it should have been No. 14 Dey Street. We take pleasure in making the correction, and trust the public will bear the number in mind.

LOADING PAPER SHELLS.

MOUND CITY, Ill., March 28, 1877.

EDITOR FOREST AND STREAM.

AS I had never seen any satisfactory means in use for confining the charge in paper shells for shot guns, I have adapted a plan of my own. That is, I believe it to be my own. My objections to creasing the shell is that it is not effectual; the crease gradually vanishes as the shell is handled. While the plan of crimping the end of the shell in on to the wad causes the crimped end to blow off, rendering the shell useless for further filling, it also has to a certain extent the same objection as creasing. Some of my acquaintances use mucilage, and even glue on their top wads to retain the charge. The objections to this method are so obvious that it will not be necessary to mention them further than to say that in so doing you present a rough, sticky edge to the wad, where you should have a smooth lubricated one.

My plan is this: I stick a common pin through the diameter of the shell close against the top wad, or sometimes I use two crossed in the center; this last in my large shells with heavy charges of shot. I choose as small wire as I can find in the pin, and after it is placed as above described, I pinch the head and point off close to the outside of the shell with a pair of nippers. I have made a simple device for inserting the pin. It can be made by any one of ordinary genius, and I will give a description of it to any one addressing me for it. I would give it here but it would require a sketch, or drawing, which, of course you could not insert. The only objection raised by those who have seen my plan is, that there is danger of scratching the barrels with the pins. But I have fired hundreds of them through my new gun and can see no marks from them. Very truly yours,

JOHN R. WHERRY.

Our correspondent's plan may be a very good one, but we confess we should object to trying it in a fine gun. As for his remark regarding the ends of crimped shells blowing off, we certainly have never met with any such experience, and we have now in our office a common Ely brown paper shell which has been reloaded (with Dittmar powder) some eight or ten times. It is true that the charges in crimped (or turned in) shells, will, after a time, particularly if they are carried loose in the pocket, become loose, but one turn of the crimper makes them as tight as ever.

—This is the season when the editor shouts up the pipe to the printer, "The poem sent up yesterday, headed, 'Spring is Come,' you can keep over for another week."

—Insanity, once unknown among the negroes, has become a great and increasing affliction. To relieve it, Virginia has established an insane asylum for negroes—the only one in the world—where more than 300 of them are cared for.

Sea and River Fishing.

FISH IN SEASON IN APRIL.

Speckled Trout, *Salmo fontinalis*. Land-locked Salmon—*Salmo gloveri*. White Perch, *Morone Americanus*. Shad, *Alosa sapidissima*.

*** For trout flies in April, see our issue of March 29th.

FISH IN MARKET.—The first Connecticut River shad of the season arrived in Fulton Market on Friday last and sold for $1.25. Some of them weighed six pounds each. Fresh caught "Kennebec" salmon, from Nova Scotia, are coming forward and find ready market at $1 per pound. Prawns from South Carolina are abundant at $1 per gallon. Striped bass are very scarce. North River shad have not been taken in any large quantities as yet, but large hauls are expected this week. Our quotations for the week are as follows: Striped bass, 20 to 25 cents per pound; smelts, 12 cents; salmon (frozen), 35 cents; green, $1.25; shad (southern), 30 to 50 cents each; native, do. 40 to 60 cents; Connecticut River, 75 cents to $1; white perch, 12½ cents per pound; Spanish mackerel 50 cents; green turtle, 18 cents; terrapin, $15 per dozen; frostfish, 8 cents per pound: halibut 18 cents; haddock, 8 cents; codfish, 8 cents; blackfish, 15 cents; herrings, 6 cents; flounders, 8 cents; sea bass, 20 cents; eels, 18 cents; lobsters, 10 cents; scollops, $2 per gallon; whitefish, 15 cents per pound; pickerel, 15 cents; salmon trout 15 cents; Long Island trout, $1; hard shell crabs, $3.50 per 100; red snappers, 18 cents; prawns, $1.50 per gallon.

OQUOSSOC ANGLING ASSOCIATION.—The annual meeting was held on the 10th of April, and the following persons elected trustees for the ensuing year: George Shepard Page, John H. Kimball, Lewis B Reed, Lewis T. Lazell, Dr. F. N. Otis, James A. Williamson, Adon Smith, Jr., George P. Rowell and William B. Wood. At a meeting of the trustees on the same day the following officers were chosen: President, John H. Kimball of Bath, Me.; Vice-President, Lewis B. Reed, of New York; Secretary and Treasurer, James A. Williamson, of New York.

MASSACHUSETTS.—*New Bedford, April* 13, 1877.—Notwithstanding the cold northeast storms of the past week our markets are well supplied with halibut, cod and herring. A very few shad have been taken thus early. The trout sportsmen report small fares, although some of the knowing ones have had good luck. CONCHA.

FISHING MATTERS.—The number of fishing arrivals reported at this port since our last issue has been 24, 4 from the Banks and 20 from Georges. Fish receipts about 500,000 lbs. codfish, and 325,000 lbs. halibut.

The fish market continues quiet, with a rather better call for Georges cod. The stock of cured is small, and it is difficult to fill orders readily with prime fish, but with better weather for curing, the supply will soon be sufficient for the demand, although the quantity in butts is small for the season. It would be difficult to fill orders at less than $5 per qtl., although we hear of special transactions at 12½ cents off this price. Grand Bank cod are in small stock, and held at $4½@4½ per qtl. as to quality. The stock of frozen herring has been closed out and the fleet are seeking bait elsewhere. Fresh halibut have been in moderate receipt and prices have ruled favorably. The stock of smoked halibut is entirely inadequate to meet the demand.—*Cape Ann Advertiser, April* 12.

NEW JERSEY.—*Kinsey's Ashley House, Barnegat Inlet, N. J., April 8th.*—Flounders have commenced biting. Some six boats met with good success Saturday. One New York sloop, the Hope, has met with great success in the codfish line, taking as high as 3,000 lbs per day. B.

FLORIDA.—*New Smyrna, April* 9.—The unusual coldness of the season has interfered with our sport this season, though I have killed the largest bass (30 lbs.) this winter that I ever secured with rod and reel. Several others of equal size have been killed by visiting sportsmen. S. C. C.

DISTRICT COLUMBIA.—*Washington, April 16th.*—Our fishing season has already commenced, and quite a number of fine bass have been captured in the Potomac, most of them at the foot of the Great Falls, which is their favorite haunt at this season. Others have been caught in the neighborhood of the Little Falls, but they are not so plentiful at the latter place as above. White perch fishing near the Chain Bridge, to which I referred at length in a recent letter, is now excellent; they are biting rapidly, and fine ones are caught daily. Two gentlemen who went up yesterday took over seventy splendid ones in less than two hours. Owing to the backward spring, this sport will continue this year until about the 1st of May, as the perch have not ascended the river as early as usual. B.

VIRGINIA.—The Legislature of Virginia has recently passed an act to prevent the destruction and to promote the multiplication of fish in the streams of that State. It provides that during the next six years no fish shall be caught otherwise than by angling in any streams above tidewater. It is made unlawful to take mountain trout between September 15 and April 1 by any process whatever, and at other periods only by angling, a similar provision applying to black bass between May 15 and July 1 of each year; possession of these fish within the prohibited periods to be *prima facie* evidence of the violation of the law. The penalty for infraction of the law is fixed at a fine in each case of $20 and imprisonment until the fine be paid. The offender is also to forfeit his boats, nets, or other illegal contrivances in such taking of fish. The act is now in force.

BASS FISHING AT HALIFAX INLET, E. FLORIDA.

"It is a countrie full of havens, rivers and Ilands of such fruitfulnesse as cannot by tongue be expressed, and so many sortes of fishes ther, ye may take them without net or angle so many as ye will."—*Jean Ribault's Voyage to Terra Florida*, 1562.

WE dropped our anchor on a bank between the two rivers in about three feet of water. Bartolo waded off towards the shore, and with two or three casts of his net secured a dozen mullet, a fish from six to twelve inches long, bright and silvery, which when cut into three or four pieces makes the best bait for the fish of this region, except the sheepshead, and even they will often take a mullet bait. Then we began to cast for bass, throwing out the baited hook from the reel with a two-ounce sinker, into four feet of water, about fifty feet from the boat. In a few minutes my bait was seized with a sharp tug, and I was playing a lively fish, which after a short run shook the hook from its mouth and escaped. I wind up my line, put on a fresh bait, the other having suffered from the teeth of the bass, and cast again. Now C. has one, which he secures after a long struggle, a bass, as here called—the red drum of Virginia, or the red fish of the Gulf coast—weighing about six pounds. By this time I had hooked another of about six pounds, which I saved. The bass taken here in winter average about five pounds, running from two pounds to thirty, the large fish being rare at this season. In the summer and fall they run much larger, sometimes as heavy as fifty pounds. Those over twenty pounds are called "channel bass."

Holbrook, following the older naturalists, calls this fish *corvina ocellata*; the new school of naturalists at Washington have given it the name *Sciænops ocellata*. Having little Latin and less Greek, I am unable to say which is best. Under whatever name he swims, however, the red bass is a game fish, in habits something like the striped bass of more northern waters; and when in season, a valuable food fish. When dried and salted, it makes a very good substitute for dried codfish.

Three or four more of moderate size were taken, when I hooked a heavy fish, which took as I was drawing in my line. It took out thirty yards at the first dash, and fought hard for fifteen minutes, when I brought it within reach of the gaff in the experienced hands of Bartolo. It weighed after reaching home fifteen pounds, and was in fine condition. When fresh from the water, the bass is a brilliant fish; those from the sea are silvery in color; those from the mouths of fresh-water rivers are of a bright golden hue; the scales are large and strong; teeth in the mouth small, but it is furnished with teeth in the throat, which are like a pavement of enamel. C. hooked a small shark which soon cut off his hook and departed, but the marauder had scared away the bass, and we left the ground with a score of eight, not, however, until I had hooked a big sting ray, *Trygon hastata*, which moved off seaward with irresistible power, taking out my whole line of about seventy yards at one rush, and parting it at the reel, so that I lost it all. I have several times killed rays of thirty pounds to fifty pounds with the rod, but when they get to be 100 pounds in weight, nothing can be done with the rod and reel; they are too heavy to be turned; their play is so slow that they cannot be tired out as active fish are, by their own exertions, and something must give way. I have seen one ten and one-half feet long and five feet wide, weighing 150 lbs, killed with a strong hand line. It is a dangerous fish to deal with, on account of the formidable weapon which it carries in its tail, a sharp bone four or five inches long, barbed along the sides, and covered with a black slime supposed to be very poisonous. The ray lashes with its long tail when drawn towards the boat, and sometimes inflicts very painful and dangerous wounds. These rays are numerous and very troublesome to the fishermen in these waters, and would be more so but that they are the favorite food of their cousins, the sharks, which eat them up, all but the tail, which is often found on the beach, looking much like one of the bull whips used by wagoners on the plains.

"I have had enough of this, Bartolo," said I; "too many sharks and rays here; where shall we go?" "I think," said he, "we'd better go up yonder big creek; the wind is too strong outside, and we will find a sheltered place under the mangroves." So we up anchor, and rowed about half a mile up one of the numerous creeks which cut up the marshy region on the coast into a thousand islands, covered principally with the red and black mangrove brushes, though some of the larger ones contain dry hammocks, with cabbage palms, live oaks, and pines. When we came to a spot where three of these creeks met, forming a wide bay, we anchored at one of them. In another creek, not far off, we saw three boats with fishermen. "Who are those people?" inquired Mr. C. "Some of the Sneymaites. They have found out this creek since they saw me catch some channel bass here a while ago, but they don't know the best spot. You'll be likely to hitch a big one here." We anchored near the shore where the channel was about six or eight feet deep, and the first fish was a large salt-water trout, hooked by Mr. C., which was gaffed after five minutes play; it weighed seven pounds when brought to the scales at home—a most beautiful fish, dark green or olive on the back, sides and lower parts like silver, with three rows of black spots on the upper part of the sides, like the lake trout of the Adirondacks, which it exactly resembles in form, except that instead of the small adipose fin of the salmons, this fish, called by the learned, *Cynoscion Carolinensis*, has a double dorsal. It is a near relation to the weak-fish or squeteague. We caught two or three small bass, and then I hooked a very heavy one, which ran out forty yards of line. I had mounted a new one of 150 yards, and fought for a long time at a distance from the boat and deep in the water, so that I could not see the fish, though Bartolo pronounced it a large channel bass. At last it broke water, and showed a tail eight or ten inches broad, but appeared as strong as ever; when at this moment Mr. C. hooked another heavy fish and we were but playing them at the same time, I at the bow, and C. at the stern of the boat; Bartolo standing between us, gaff in hand, ready for action. One of the other boats, seeing the struggle from afar, came towards us to witness the result, which soon took place by my fish being brought exhausted on his back to the boat, where he was nearly gaffed by Bartolo, after a struggle of thirty minutes. In due course the other fish was secured, and proved to be a channel bass of about the same size, weighing at home twenty-eight pounds, and mine twenty-nine pounds; it was forty-one inches long, and twenty-three around the shoulders. S. C. C.

—Mr. John Blakely of Philadelphia caught a drumfish weighing 71 pounds, in the Mataughs River, two miles south of St. Augustine, Florida, the past season. Mr. T. C. Rowe took four drumfish that weighed 195 pounds in the aggregate. All taken with rod and reel.

A FEW HINTS AND DIRECTIONS FOR FLY FISHING FOR BLACK BASS.

BY W. HOLBERTON.

A FLY rod for black bass should be a moderately stiff rod, not less than ten or more than twelve feet long—such a rod as would be called a rather heavy, trout rod. There is no necessity of its weighing over 12 ounces, but it should weigh at least 7½ or 8 ounces. Such a rod will cost from $7 for a plain ash and lancewood (very serviceable) to $60 for the finest Leonard or Norris split bamboo. The reel should be a plain click reel, to hold from thirty to fifty yards, and costing from $3 to $10. The best line is really the cheapest, and is made of braided silk, waterproofed, and tapering toward the ends; this line costs ten cents a yard, and will last five or more years. A cheaper article can be had for about five cents a yard, but is not reliable after the first season. The leader should be not less than six feet long, and made of salmon gut. Where the fish are large, one fly is sufficient to attach to the leader; where they are under two pounds, as in the smaller rivers and outlets of lakes, two and even three flies can be used to advantage.

Black bass, like their more aristocratic brethren, the speckled trout, are very changeable in regard to the flies they will take. Sometimes the scarlet ibis, particularly early in the season and on rough, windy days, is the most killing fly that can be used, while at others a white miller or a bright Ferguson or jungle cock will be found the thing. The following is a good list, viz.: The Ferguson, academy, Holberton, May fly, jungle, dark and yellow; turkey, abbey, scarlet ibis, St. Lawrence, Montreal, grizzly king, and professor. For smaller waters, a hackle, either yellow, red or brown, dressed on a sproat hook from four to six will prove killing. I found in the St. Lawrence River, Canandaigua Lake, and other large waters, that a large fly was necessary; a small fly only took small fish, about No. 0 to 2, and a sproat hook is by all means the best. A light rod will not hook a fish well, if the fly is tied on a Limerick or other hook with a large barb and made of heavy wire.

In casting, the fly should be allowed to sink at least a foot below the water before drawing it in for another cast. This is important. As long a line as possible should be thrown, as they are a shy fish. When hooked, keep a steady strain on them, and beware when they jump. Do not let them strike the line with their tail or fall on it. Contrary to most anglers, I lift the point of the rod so as to keep the line above them. If in a boat, keep them, if possible, from getting under it, which they will try their best to do.

As to their taking or not taking the fly, I think it is not worth arguing. I have taken them for fifteen years with a fly, and never any other way, and have never seen the water in which they would not take it. There are some days when they will refuse the fly, or take it poorly, as with trout; but as to their never taking it in some waters, "I have my doubts." Black bass, particularly in running water, are a very gamy, vigorous fish, and afford the most exciting sport. The best fly fishing now is to be had in the St. Lawrence, among the Thousand Islands, and in Florida; but nearly every stream and pond has been stocked in this part of the country, and this year and next will begin to show the results. There is no use in trying to use the fly in water over twelve feet in depth. The best ground is around the shores of the lakes, on rocky shoals, near old logs, etc.

THE EAGLE CLAW.—This contrivance is attracting a great deal of attention, like almost everything else advertised in our columns. One correspondent inveighs very severely against it, as notice below. Now, the "Eagle's Claw" is like a man's hand; it can be put to evil and useful purposes. For instance, we ourselves attached a piece of meat to the trigger of one the other evening, and hung it up on a nail in the wall, so that it swung three inches from the floor. In the morning we found a rat dead in its grip! The "Eagle's Claw" will catch anything that it is set for, that is sure; but as the advertiser does not recommend it as an infernal machine for the destruction of game and fish alone, we must be charitable enough to regard it like anything else that can be put to a good use or a bad one, though we perceive that it is not accepted by our corrrespondent, the "Senator," with the *eclat* that it would be by a trapper or intriguer of vermin:

EDITOR FOREST AND STREAM.

I am sure I echo the sentiments of all true sportsmen when I regret that Mr. Coate did not apply his ingenuity to some more worthy object than the above. Are there not devices enough for destroying game and fish, without such a cold-blooded implement of torture as this? With a very earnest desire for his future salvation, I cannot refrain from saying that I hope he may sit on one of these infernal machines, and then, if its claws do not touch his conscience, they will inflict a pang on something more sensitive, and perhaps remind him of the torture inflicted on its victims. SENATOR.

MASSACHUSETTS ANGLERS' ASSOCIATION.—In the list which we published last week of the newly elected officers of this Association, we should have printed George B. Brown, Recording Secretary, and Henry H. Kimball, Corresponding Secretary, whereas the type read simply, "Recording Secretary, Henry H. Kimball."

—We have just received from John Haily, 320 Henry Street, this city, several dozen trout, bass, and salmon flies of various patterns, tied in the most superb manner. Mr. Haily gives instruction in the art to those who desire it for little more money than a book of instruction would cost.

—The poachers are at work on Long Island again. Thompson's trout preserves at Noyac were visited a few nights ago by thieves and robbed of about 500 of his largest fish, valued at from $800 to $1,000. His watch-dog had been killed a day or two previously.

RATTLESNAKES AS FISH BAIT.—Dr. H. C. Yarrow sends us the following incident, which occurred while he was engaged in exploration in Utah, in 1872. The party were encamped near the Webber River, which abounds in trout, and one of their number, a portly disciple of old Isaak, determined to have a day's fishing: so, one morning he started bright and early, equipped with everything needed but bait, which he determined to secure on the ground. Arrived at a desirable site, he deposited lunch basket, rod, etc., and waited to hear the chirp of a grasshopper, the bait he intended to use. He did not wait long. "Ha! ha!" said he, "there's a rouser, sure enough!" and off he stole, sombrero in hand, intent on on his prey. Cautiously he advanced through the sage brush, stumping his toes over stones, the chirp sounding nearer and nearer, until at last he knew he must be very near the creature. Then he gently depressed his hat, peering around, and was just about to precipitate himself on the ground, when he saw an enormous rattlesnake, coiled and ready to strike, almost beneath his feet. He had lost no rattlers, so giving a yell, he attempted to leap backward, but his foot slipped, and over and over he went, down a hill until he fell plump into the river, out of which he gathered himself up, and departed from that neighborhood a wetter, but a wiser man. He had mistaken the rattling of the snake for the chirp of a grasshopper.

Moral: When trout fishing in the West, look out for "rattlers," especially if you should want grasshopper bait, as the noise made by the two animals is very similar, the only difference being that the noise of the rattle is more prolonged than that made by the insect. After a little experience they may be readily distinguished.

AN occasional correspondent writes:—"During the summer of 1871 I had some capital sport in the tributaries of the Trinity River, Texas. On one occasion I started on horseback, carrying a bucket and mosquito-net to catch bait, and prepared to camp out. The stream of Spring Creek was very low, but the rocky bed contained numerous large pools full of striped bass, perch, and in many places those fishermen's pests, gar-fish. Selecting a shallow, I soon caught a lot of small perch with the mosquito-net. My rod I cut in the brush, attached an upright trolling to the tip, and adjusted a reel. I had to cut my way into the edge of some of these pools. Hooking on a lively bait, I made a cast in a likely place. The float, a dry piece of wood picked up, was almost taken under by the bait, but at last it disappeared in a most unmistakable manner, and I hooked a heavy fish. It required all my care to keep clear of fallen timber and stumps, but I succeeded in landing a four-pound bass in fine condition. I took a three and a two pound fish in subsequent casts, and then moved to the next pool. It being now ten o'clock, and the sun being warm, the fish ceased running, so I selected a pleasant spot, and prepared some fish for my dinner. I strolled down the creek with my gun. The bass and perch were swimming near the surface, and numbers of water snakes moving about. I shot some very large ones. At one place my setter made a point at the edge of the bank. Looking over I saw a very large rattlesnake just at the edge of the water. My poor dog had so many narrow escapes from snakes that he was always on the *qui vive*, and would always show me a snake.

"A bass split down the back and broiled, with some coffee, afforded me an excellent repast. It was too hot to fish, so I smoked and got a fresh supply of bait, until about four o'clock, when the fish began to move. I now had some excellent sport, taking from three to four in each pool averaging from one to four pounds. There was one very deep pool I had not tried at sundown, so I decided to wait for the moonlight, and in the meantime prepared my camp for the night, cooked some fish and enjoyed my pipe till the moon rose. With great expectations I cast into the pool. In a few minutes down went the float, and I caught a tartar. My rod bent almost double, and then, with a straight rush, the line snapped (foul of the reel handle). Must have been a gar. I now put on a gimped hook, lost two or three baits by the gars, and then hooked a fine bass of five pounds, which I landed. I got two more from three to four pounds, and then a snake took the bait, and I hooked and pulled him out. My dog, who enjoyed seeing the fish caught, retired with disgust, and I had a lively time killing it and saving my line from tangle. The gars were so troublesome now that I could not keep a bait on, so I determined to wage war. I placed the rod so that the bait just touched the water; soon a large gar came and received a dose of shot, and with great splashing subsided. I served several others the same way, and then, wrapped in my blanket with saddle for pillows, slept till daylight.

"In the morning I tried some of the old pools, taking several more fish. At one a snake troubled me, pulling the bait; it at last went to the edge of the water to some fish cleanings, and I killed it. It was nearly seven feet in length. After breakfast I returned to my quarters well satisfied with my sport."

SENATOR.

BROOK TROUT FISHING AT LAKE GEORGE.

TO THE FOREST AND STREAM.

Since my letter to you on lake or salmon trout, there have been hundreds of pounds taken by fishing through the ice. One was taken the second week in March that weighed seventeen pounds. This is the largest trout taken in many years. It was taken with a small hook and bait, such as is used for taking trout of from four ounces or upward.

In this letter I was to treat on brook trout, known as the square-tailed, spotted trout. Many people start out from the cities during the summer with the expectation of having a fine time and great success in the country catching brook trout. Here let me say to all such parties that they are certainly doomed to be disappointed. Those who wish to enjoy and have good sport in this line of fishing must be in the country early in the month of May and June. As soon as the snow water from the mountains is done running, the trout make their appearance. In streams where the country is cleared and the snow gets melted and runs off much earlier than it does from the mountain streams, they are taken days and weeks before they are found in the mountain streams. The people in the country knowing these facts watch the disappearance of the snow, and as soon as the spotted beauties make their appearance they are enticed to become the victims and to decorate the table of some country gent that has watched long and anxiously to be the first of the season. Like the first shad that is taken in the spring to the city gent, so is the first mess of brook trout to the man or boy in the country. There are scores of small streams running into the lake from one-fourth of a mile in length to four miles long, four miles being the longest stream from its head to the lake; these each and all have more or less trout in them. When it is known that a good catch has been made in one of these small streams it will be shunned and left alone for a time. When a party strikes one of these streams and finds the footprints of some person fresh in the earth along its banks, he is well aware that he will have but very little success that day in that stream. The news of a stream being well cleaned goes around the country about as quick as though a black bear had entered a neighbor's sheep yard and killed a sheep (which at this day is not a thing in this vicinity unknown). Lake George is surrounded by mountains which are broken by ravines and gorges, in which flow the trout streams. A few miles to the west runs the Hudson River, into which innumerable small trout streams empty. Within a few miles of the shores of Lake George hundreds of pounds of brook trout are taken every spring. There is a small lake a few miles west of Lake George, known as Lake Pharo, in which abound enormous quantities of these trout. They are of the richest flavor and of the richest color of any trout found in this section of the country. They can be seen during the spawning season at the different places where they collect to deposit their spawn in quantities recorded by the barrels. I have stood on a log lying over one of these beds where the water was from one to four feet deep, which would be alive with trout from the bottom to the surface. The temptation to take them is great, but no man that has any regard for law, or the damage he would do in destroying thousands by killing one of the female beauties at such time, will commit such an act. Notwithstanding, it is done by a class of inhuman beings who steal in the night to the shore by the side of these spawning beds, and with hook baited with worms or pieces of fresh meat, take them as they would take fowls from their roost—steal them in the night.

The brook trout in Lake George come to the streams from deep water three different times in each season—early in the spring, and again in the month of August, then in the fall, at which time they ascend the streams to deposit their spawn. In the month of August they come to the mouth of the cold mountain streams and go up some distance. I have taken them over one mile from the lake. At this season of the year they are called silver trout, for the reason that they are a bright silver color, the spots being like scarlet. The meat of this trout is of three colors—some are white, some golden, and others a rich scarlet. They are usually of a good size, running from a quarter to two pounds each. A very clear and cold stream runs into the lake at the head; where it comes to the lake it runs across a wide, sandy beach, and forms a sand bar from twelve to eighteen inches high. With a long rod and line the angler stands on the dry sand and casts his fly or bait just over the bar, at which point the beauties are enjoying the clear and cold spring water from the mountain's side. I have stood at this point with a long, light cedar pole, with hook baited with worms, and when the bait struck the water it would be taken with that flash-like movement that no other fish but the nimble trout can make. The water would be in a boil for a number of feet in circumference by the greedy school that was lying so quiet enjoying the cool water. The one that succeeded in swallowing the bait would be led out of the current into still water, and as gently as possible up the sloping sand beach on to dry land. Now and then one would be slightly hooked and as soon as he struck terra firma would break loose; then for a tussel who was to be the victor; if close to the water it was uncertain as to the capture of the trout, but a sure thing that you got wet feet in the struggle, as you would not like to lose such a beauty, for the largest ones invariably get loose. In the fall of the year, when these same trout come to ascend the streams to deposit their spawn, they are darker colored, having a reddish tinge. They can be taken after dark at the mouth of the streams by using a piece of perch for bait. By throwing the bait just over the sand bar and letting it lie on the bottom, it will be picked up by the trout as they come in search of the entrance to the stream. This mode and time of catching trout is now stopped. But after they get up the streams they are now and then burred up by such as would steal clothes off the drying line if left out after dark. With a hint to some that claim to be good at catching brook-trout I will close this article. I claim that with a rod ten feet long and a line four or five feet long from tip to hook and running through rings to near butt of rod so that you can take hold of the line and draw the hook up to the tip of the rod, by so doing the hook can be put into a hole in the stream that is covered with brush, and then slacking up on your line, let the hook into the stream; if a trout bites, instead of giving a jerk with the rod and getting your fish fast in the brush, give the line a sudden jerk and draw the fish up to the end of your rod, and run your rod back of you until you can reach the fish. My rule is, to go up the stream as far as you want to fish it down; get into the stream and never leave it unless you find a place where the water is too deep for comfort. In this manner you keep constantly going ahead of you little particles which the trout are busily picking up instead of lying still and shying at the first glimpse of your rod or line. You can get at every little nook in the stream and not be noticed by their sharp eyes. I will let the best brook-trout fisherman (that will follow the stream on the bank) have the lead of me and I will follow him a few rods behind, and will bet him a good joint rod that I will get more pounds and larger trout than he does. This I have done many times. At this point of my writing I was called upon by the man that caught the large trout spoken of at the beginning of this letter; he caught him in 160 feet of water; he pulled him thirty feet, supposing he had a sunken bush fast to his hook with a small trout fast in it. When he found what he had he took it easy; was over half an hour when he got him through the hole and on the ice; the trout was so used up that he gave up life without a struggle. He says he is the king fisherman of Lake George, and he shall go West this fall. A thirteen-pounder was taken the fourth week of March. Any quantity of smaller ones are being taken. Yours respectfully,

THE OLD PILOT.

SETH GREEN ON NEEDLE POINTS.

ROCHESTER, N. Y., April 12.

EDITOR FOREST AND STREAM.

There has not been much said lately on "needle points." I had made up my mind not to say anything more about them and let the people plod on in their ignorance and take home small baskets of fish. But seeing a letter in your last issue from "Angler," I thought I would write a few lines and post all who wish to be enlightened on the subject. I have no doubt that "Angler" is a skilful fisherman, but his hooks may not have been just the right bend. It is a nice thing to get them just right every time. The point of the needle hook wants to stand at least one-fourth higher than the barbed hook. "Angler" is one of the first to try them, and I have no doubt he will succeed after experimenting until he gets the right bend, and take salmon or any other kinds of fish that will take a fly. Yours, SETH GREEN

OUR BOSTON LETTER.

BOSTON, April 12, 1877.

EDITOR FOREST AND STREAM.

The lovers of salt-water met Fast Day at City Point, South Boston, to enjoy last year's festivity over again. Although the day was not quite so warm or breeze so gentle, the Mosquito race proved a success. Some fourteen tenders put in an appearance, and very good time was made by the tiny crafts, covered with clouds of canvas. The wind was north northwest, and the bay (Dorchester) was fleeced with white caps; very few accidents happened, and none of a serious nature. Maj. McDonough's "Lizzie" filled with water, and withdrew from the race. The "Wayward's" tender carried away her mast, and the Nina's boat broke her boom. The following table gives the number of entries, time of starting of each class, and the return:

FIRST-CLASS—CENTRE BOARDS.

Name.	Started. H. M.	Returned. H. M.
Mary	11 56 A. M.	time not taken.
Roslyn	11 56 A. M.	12 36
Arrow	11 56 A. M.	12 32
Lizzie	11 56 A. M.	time not taken.

SECOND-CLASS—KEELS.

Name.	Started. H.	Returned. H. M. S.
Sunbeam	12 M.	12 33 30
Chiquita	12 M.	time not taken.
Hairpin	12 M.	11 34 30

THIRD-CLASS—KEELS.

Name.	Started. H. M.	Returned. H. M. S.
Maraquita	12 06	12 34 50
Young Turk	12 06	time not taken.
Niagara	12 06	12 34 40

Nina started 12:06, time not taken; Ivy, time not taken; Our Pet, time not taken; Dart, time not taken; Wayward, time not taken. The prizes were $10 gold pieces for first prize in each class, and $5 for second prizes, and were awarded as follows: First-class—Roslyn, first prize, Capt. Ross; Arrow, second prize, ———. Second-class—Sunbeam, first prize, Capt. W. S. Nickerson; Hairpin, second prize, J. Winniatt. Third-class—Ningara, first prize, Capt. Arthur Dean; Maraquita, second prize, Capt. P. Dexter.

The judges were: Capt. J. Flynn, of South Boston Club, and Commodore F. E. Peabody and Capt. P. Dexter, of Dorchester Club. At this time of the year a salt-water bath is not very enjoyable, yet some of the participants testified to the wetness of the water by their appearance on reaching the shore.

The Boston, South Boston, and Dorchester Yacht Clubs deplore the death of one of their most active members, Capt. S. J. Capen. The flags were placed at half-mast Fast Day in respect to the honored dead.

The pleasant weather of the past few days has brought the yachtmen out from the winter's stagnation. Painting and carpentering have been very brisk, and the boat shops are assuming their wonted activity. A Mr. Gleason is building a 20-foot catamoran, on a tested model. The model is five feet in length, and easily beat an 18-foot Newport boat. Mr. Gleason expects to get her round to City Point, May 1st.

At the annual meeting of Dorchester Yacht Club, held this month, the following officers were elected for the ensuing year:

Commodore, Frank Peabody; Vice-Commodore, S. P. Freeman; Secretary and Treasurer, Frank W. Weston; Measurer, H. Devenport; Fleet Captain, George F. Clarke; Trustees, C. E. Folsom, W. H. L. Smith; N. T. Adams.

The Club added to its already large list of yachts, Paul Butler's schooner yacht America; Eben B. Phillip's schooner yacht Fearless; George H. Tupp's schooner yacht Betty; George M. Winslow's schooner yacht Humes; John Bryant's sloop yacht Shadow; H. E. Hibbard's sloop yacht Ettie May; George Lee's sloop yacht Peri.

Thomas Manning, Esq., of New York, has been elected honorary member of the Quincy Yacht Club, representing the Club in that city. An early regatta of this Club will take place in May. Under its present very able management, a brilliant season is expected. KEDGE.

SALT WATER NOTES.

BOSTON, April 10.

EDITOR FOREST AND STREAM.

In my last letter we lay at anchor in Scituate harbor. About two o'clock in the morning I was awakened from a pleasant dream of home, by a heavy body falling on me. It proved to be Charlie. The boat had grounded on the bar after all, and he, lying in the port berth, had fallen out as she gradually heeled over, where the tide left her. We had all slept sound, and if this occurrence had not happened we should probably have slept on. I awoke with a loud exclamation, thinking some practical joke was being carried out, but when I realized the facts of the case it did not take me long to wake the others, and appear on deck. Here was a go! The old saying, "It's always darkest before light," proved true. We could hardly distinguish objects at any distance. The tide was running a mill-stream by us, and the boat kept heeling more and more as the water left us. A slight scraping noise, accompanied with a loud splash, startled us, and for a time we thought some of the party had fallen overboard. Procuring a lantern, I crawled forward and found that the fore hatch cover and cabin companion-way slides were gone. Perhaps there were no invectives used just then. I should liked to have had that fisherman for a few moments. But we were in for it. We had retired with scanty clothing on, and being turned out in such an unceremonious manner, we neglected to provide for ourselves in our excitement. We thought it about time, however, and went below. What a sight we saw! Everything had fallen from the port side down into the starboard bunks, and as the boat settled on her beam, the water poured in her upper streaks. Her upper planks were painted black outside, and of course drew the rays of the sun very hard, and as she had been out of the water for some time before we started on the trip, had dryed the wood so that it had hardly had time to swell back into position.

But to make a long story short, we had to fish the things up from the water. Perhaps there was strong language used then! One or two bags had withstood the dampness, and things came out comparatively dry. But all our outside apparel was soaked. We either had got to put it on, wet as it was, or perch round in our flannel shirts. If you could have seen us, dear readers, perched on the weather rail waiting for daylight, you would have seen a funny sight. About 3 P. M. Ned and I commenced to bail, he with his carpet-bag, and I the bucket. We thought she would fill before righting, if we did ease her some way. Captain Bill took the rest of the crew and got two anchors off on the port side; then they took the fore and main throat halyards and made fast to the roads, and swayed up on the halyards until every line was taut. In the meantime Ned and I worked like beavers, and before the tide turned we had the water all sponged out above the cabin floor. If we could only keep water out until she commenced to lift, the others could help her by taking in the slack line, so we kept wishing for daylight. The fix was a bad one, but when you have to pan round in the dark you feel cross with everything and everybody. Just as day began to break the tide turned to come in, and to work we went. Charlie was added to the bailers, and did good execution with the bread pan. We were too much for the water, and kept her free; the others watched the slack and took it in, took it in too fast, for she fell over on the starboard side before she got afloat, but she was water borne and it caused no new difficulties. As soon as we got her on her legs, I started up the fire, and prepared for breakfast. "Say, steward, give us something good after this hunt!" was the universal cry. "Get us up a home-made dish," cried Ned; "I wish I was there now."

"We will take all the wet bed clothes and toilet articles ashore, while you get things ready, say Cap." After they had been gone some time I looked out the fore hatch, and you would have thought there was to be an auction of old clothes by the display on the rocks and grass ashore. Every sunny spot was decorated with either blanket or towel, shirts, pants, stockings, etc; while the rest of the wet things (animated) was sprawled out in the genial sunshine. At seven A. M. I sounded the fog horn to call them to grub, and we sat down to broiled steak, fried potatoes, hot johnny cake (the home-made article). It did not take long to clear the table and get things in place after order was restored. Part of us looked up a boat builder, while the rest went to the stage office to see if the sixth had arrived. After making inquiries we made the acquaintance of Messrs. Geo. Lawley & Son, boat builders, who kindly waived other jobs and tended to our necessities. The rest of the boys were unsuccessful in finding our absentee.

Scituate is a country place about twenty-five miles from Boston, on the line of the Old Colony R. R. There is a very homelike hotel in the place, and the people generally are very hospitable. The post-office is combined with a variety shop. The inhabitants depend on fishing and mossing; the latter business is carried on extensively by the lower classes. To a stranger it is interesting to see the changes of color this sea moss has to go through before it is fit for use. At early morn you will see the fishers gliding out of the harbor (when the tide permits) in their small open boats. The boats that are used for mossing are either dorys or sixteen-feet sprit sail boats, such as are used in trawling lobsters. The rake, with long teeth, is the implement used for pulling the moss from the rocks at low water. After it is brought ashore the moss is spread out like hay to dry and bleach in the sun. When it is first pulled the color is a dark purple, and it bleaches out to the color you get it from the druggist or grocer. Much care is used in the process. If the dew falls heavy, or should there be a likelihood of a shower and the moss should get wet, it is spoiled. Every night it must be cocked up and covered with canvas until it is ready to pack into barrels for market. We made the acquaintance of the Dixon brothers, who gave us good ideas of the hard work necessary to produce a good article. We also received a package for use on the trip. I was going to take about a bucketfull, and was surprised when they told me half a handful would make all the blanc-mange and ice-cream we could eat at once. They rolled us up about as much as you could stuff into a quart measure, and from that quantity we used all we wanted, and I took the rest home and it lasted almost a year. I found a butcher's stand before I got back, and for a change got some steak (he had nothing else). Milk was plenty and cheap, and while we staid we enjoyed many a quaff of the lacteal fluid, fresh from the cow.

Our instructions were to proceed to Provincetown if we did not meet our friends in Scituate. The wind had increased to a gale from the southwest, and the scud was blowing thick and smoky. The high rollers were thundering on the beach. Far as the eye could reach, the angry billows tossed their heads, capped with white foam, and the atmosphere looked murky. How long this would last we could not tell. Dinner-time came round, and was got through with, still no signs of mild weather. The wind hauled into the south'ard and kept increasing. About 1 P. M., despite the advice of the fishermen, we determined on trying to get to Provincetown. We battered everything down; put two reefs in the mainsail, took the bonnet out of the jib, hauled up the mud-hook and ran out of the harbor. If the sea had not been so rough we could have made a lay for Race Point, but tons of water would strike her on the bluff of the bow and force her to lee'ard, which her small mainsail could not make up. Ned and I were for'ard stowing cable and anchor, and when we struck out clear of the headland, and got the full force of the wind, it would almost take your breath away. Quite a crowd had collected on the wharves to see us off, and many shook their heads, saying we would be back before long. The boat was no more than an egg-shell in such water, and after she had pitched twice in the same hole and put Ned and I waist deep, Captain Bill thought it time to turn tail. We were not long in starting the mainsheet, but before she got fairly agoing free of the wind, she put two hanks of her jib under, and the sea came across the house out over the taf-rail. One moment we would be up on mountainous waves, the next buried in a watery valley. We were not long getting back, and snugly anchored in the harbor again. KEDGE.

—The Passaic River Rowing Association have decided to hold their annual regatta on June 19th, the number of races to be four—a single scull, pair-oar gig, four-oared shell, and a six-oared gig race. The four-oared race is to be one and a half miles and return, the others one and a half miles straightaway. All the Passaic Clubs give promise of making a finer display on the river this coming season than on any preceding one.

NEWBURGH YACHT CLUB.—This Club will hold its fourth annual regatta August 1st. There will be four classes, entrance free, as follows:—First, open boats over twenty-six feet in length; second, open boats over twenty-two feet and not exceeding twenty-six feet long; third, open boats twenty-two feet long and under; fourth, cabin yachts and all yachts with working sails. Two prizes will be given in each class, except the fourth, in which one prize only is offered. The Newburgh Club also offers a prize of $250 in gold, to be sailed for on the day following the regatta. The event will be open to all open yachts under thirty-five feet in length. The entrance fee is fixed at $100, and the whole amount thus obtained will be divided and distributed as prizes according to the number of entries, the club's $250, gold, being added to the first prize. The race will be sailed over the usual course in Newburgh Bay. Entries to the regatta will close on July 31st, and to the sweepstakes race on July 28th.

—The following are the officers of the Halifax, Nova Scotia, Rowing Association: President, C. J. McDonald; Vice-President, Geo. H. Davis; Treasurer, W. E. Weir; Secretary, J. R. Townsend; Committee, M. Power, Thos. Spelman, Wm. Ross, Alex. McDonald, John Roue.

National Pastimes.

BASE BALL.

—The College nines are looming up as powerful rivals of the leading professional teams of the League and International Associations. On fast day the Harvard College nine visited Lynn, and there defeated Cummings' Live Oak, professionals, by 11 to 3. On Saturday, April 14, the Princeton College nine took a trip to Philadelphia, and there they polished off the profe-sional Athletics to the tune of 24 to 11. The same day the Yale nine met the Hartfords, of Brooklyn, at New Haven, and it was not until the twelfth innings that the professionals could win, and then only by a score of 7 to 6. On the same day, at Boston, the Harvards met the strong nine of the Bostons of 1877, and the latter won only by 5 to 3 in a full game.

—The Chelseas opened play at the Capitoline grounds on April 14th, and defeated a field nine by 21 to 2. They play the Hartfords on the Union grounds on Thursday, April 19.

—The Nameless Club defeated a field nine by 10 to 3 at Prospect Park on April 14th. Dunne, of the Chelseas, has made his debut as a curved line pitcher.

—The St Louis Club won all of their four games in Memphis, played on April 9, 10, 11, and 13. The scores were 2 to 0, 5 to 4, 7 to 3, and 2 to 0.

—The Louisvilles defeated the Eclipse nine by 22 to 1 on April 13. Only one base hit was made off Devlin's pitching

—The schedule of games to be played in the League championship arena this season has been made out, and the record for May is as follows:

Clubs.	Boston.	Cincinnati.	Chicago.	Brooklyn.	Louisville.	St. Louis.	Total.
	May	May	May	May	May	May	
Boston	—	17	12	.....	22	8	8
		19	15	.....	24	10	
					19	.....	
Cincinnati	.....	—	.....	.....	12	.....	3
	.....		.....	.....	15	.....	
Chicago	.....	26	—	.....	31	22	5
	.....	29		.....		24	
Hartford	.....	22	8	.....	17	12	
	.....	24	10	—	19	15	8
	.....	3	.....			.....	
Louisville	.....	5	.....	.....	—	.....	3
	.....	8	.....	.....		.....	
	.....		17	.....			
St. Louis	.....	31	19	.....	26	—	5
	.....		.....	.....	29		
Total	0	10	6	0	10	6	

The first games will be those between the Louisville and Cincinnati clubs, to to be played at Cincinnati May 3, 5 and 8. None are arranged for Boston or Brooklyn.

Tiffany & Co., Silversmiths, Jewelers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their timing watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. Tiffany & Co., are also the agents in America for Messrs. Patek, Philippe & Co., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Bronzes and Artistic Pottery is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. THIS LEATHER HAS BEEN MANUFACTURED

LADIES LEATHER VESTS AND JACKETS

made to order. Indispensible to all who are in any way exposed to the weather.

G. W. Simmons & Son,
32 to 38 North 2t., Oak Hall, Boston, Mass.

"THE BOSTON SHOOTING SUIT.—One of the most successful manufacturers of Waterproof Shooting Suits is the firm of G. W. Simmons & Son, Oak Hall, Boston. We had one of their suits on duty at Hunter's Camp at Philadelphia Centennial Exhibition It has grown gray in service, but is good for use yet. This suit is known as the 'Boston Shooting Suit,' in contradistinction no doubt, from the garments which are manufactured out west and at Washington, each of which has a local demand of its own.

The Boston Shootin Suit.'
MANUFACTURED ONLY BY
G. W. SIMMONS & SON,
Boston, Mass.

SOLD everywhere in the U. S, by all first-class dealers in
SPORTSMEN'S GOODS.
EACH GARMENT DISTINCTLY MARKED
"BOSTON SHOOTING SUIT," made by **C.W. Simmons & Son.**

This new design of WATERPROOF SHOOTING SUIT, made from extra quality duck, has attained such popularity as to be called for from all parts of the country, and even from England.

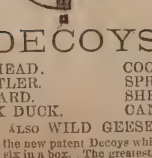
"Shipping clothing to England strikes us very much like sending 'Coals to Newcastle,' but the merits of the "BOSTON SHOOTING SUITS" have been heard of in the Old Country, and that land of sports men has sent an order to Messrs. Simmons & Son, which will doubtless be followed by many others."—*Boston Paper.*

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is water-proofed by a new patent process. The seams and pocket corners are securely fastened, and nothing neglected to render the suit perfect in every respect.

THE PRICE HAS BEEN FIXED AT $13, TO INCLUDE HAT OR DOUBLE VISORED CAP, DETACHABLE HAVELOCK, COAT, VEST, AND PANTALOONS.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.



In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, waterproof quality and capacity. The coat is a marvel in this latter respect."

PERSONS ORDERING FROM A DISTANCE NEED SEND ONLY THE FOLLOWING TO BE SURE OF A PERFECT FIT:—
BREAST MEASURE.
WAIST MEASURE.
INSIDE SEAM COAT SLEEVE.
INSIDE SEAM PANTALOONS.
SIZE OF HEAD.
MENTION HEIGHT AND WEIGHT.

BRADFORD & ANTHONY,
374 Washington Street,
BOSTON, MASS.,
Importers, Manufactrers and Dealers in

Offer their usual extensive assortment of STAPLE GOODS, and are introducing this season some NEW and DESIRABLE articles. We call attention to the

PATENT ADJUSTABLE FLOATS AND ADJUSTABLE SINKERS,

which can be attached and detached at will, without knotting or tying the line, or removing the bait or hook. Can also be moved readily on the line, and remain fixed wherever placed. These are rapidly taking the place of the old-fashioned floats and ringed sinkers.

SPLIT BAMBOO FLY RODS from $15 to $50 each.

We make a specialty of Artificial Flies. Our stock is unequalled in variety and extent, and unexcelled in quality

BRADFORD & ANTHONY received the award of the U. S. Centennial Commission in 1876 for "Exhaustive Variety of Anglers' Apparatus, especially HOOKS, LINES, RODS, ARTIFICIAL FLIES, * * of the BEST QUALITY."

Our Illustrated Wholesale Catalogue of Fishing Tackle will be mailed to any dealer whose address is sent to us. 5aplit

W. & C. SCOTT & SON'S.

First Prize Medal and Diploma awarded Centennial Exhibition, for excellence of workmanship and material in their **Premier Quality** and medium grades. Their **New Patent Triplex** Lever Grip Action and **Compensating Lump.** The attention of sportsmen is requested to the above new action. Its superior strength and solidity impart greatly improved shooting powers. Hard hitting, being the desideratum required, is obtained by this powerful gun. Prices of the New Triplex Lever Grip, $175, $225 to $400. Marked the Triplex 10-bores extra. Our highest grade is as usual marked the PREMIER QUALITY.

Extract from FOREST AND STREAM, *New York, December 26, 1876, Contributed by one of the Judges of Awards of Guns at the Centennial:*

This action (The Triplex Lever Grip) combines in the highest degree strength and simplicity, and must rapidly secure the favor of all who test its merits.

COMPENSATING LUMP. Strongly recommended. It is invaluable, and should be ordered on every gun. Costs about $10 extra. Choke-bores, medium or full. Our guns to be had of the principal dealers in the trade only.

THE GUILELESS GUIDE.

Unto the mountains I did go
In search of *Silma fontinalis;*
I hired a lad (the path to show),
A rustic free from guile or malice.

Then well equipped with fishing gear,
I did unto the urchin beckon,
And bade him choose the way most near.
Said he, "I *reckon.*"

Onward he led, through woodland rough,
Till every limb and joint were tired;
I hinted it was rather tough,
Says he, "All-*fired.*"

Thus, after trudging half the day,
I said, "You've missed the track, I know;"
With vacant stare the lad did say
"By jinks! that's *so.*"

I saw no signs of running water,
So gave it up and turned about;
"I swow!" said he, "t'aint where it oughter—
It's petered out."

Thus homeward we our faces set,
He led, and musing I did foller.
"Is aught to pay?" Said he, "You *bet*—
I want a dollar."

T. W. A.

Letters of Travel.

Western Experiences—Among the Lakes of Southern Minnesota—Wild Fowl Shooting—Western Peculiarities of Living—Spirit Lake.

We arrived at the town of Spirit Lake, in Dickensen County, Iowa, situated just across the line dividing that State from Minnesota, at sundown on the twentieth day of October, after a beautiful drive over the rolling prairie, and along the timbered shores of the numerous lakes which give to the country, in the Indian dialect, its characteristic name of "Minnesota," *land and water.*

In briefly noting the means of approach to this place, of which I am about to narrate a few days' experience, I will say that Worthington is the nearest railroad point to it, and lies in the southwestern part of Minnesota, on the line of the Sioux City and St. Paul Railroad. The train arrives there from the south at midnight, and the traveler must pass the remaining hours of darkness at the hotel. As morning dawns, the broad level of a prairie town discloses itself, with elevated plank walks raised along the shop fronts, and above that western combination of water and clay, familiarly known and long remembered as "boot-jack."

For the benefit of the untraveled, I will say that the above allusion is to the direful mud which accumulates in a Western town. Those who have been West require no explanation, and will desire that their minds be stirred to no recollection of it. The usual monotony of an outlook from a Western hotel window on a morning subsequent to arrival is broken, in this instance, by two broad lakes—fine, but naked sheets of water, which lie, one on the east, and the other on the west of the town. Between these lakes there used to be a famous *pass* of wild fowl, but owing to the pernicious habits of those with good Western appetites, the birds no longer *take in* the town in their travels, but go from one sheet to the other circuitously by way of the desolate but less letiferous prairie.

The sunlight shimmers over the surface of the eastern lake, as if it were the first surface it had struck in its distant flight from the dreary and unbroken horizon, and gradually the sun climbs up over the waste of land, as at sea it does over the waste of waters. All that day we travelled in an open two-horse wagon, across country to Spirit Lake. This was one of the earliest settlements, but in the fate of towns, the magic lines of railroad iron had dodged it to the distance of thirty miles. After leaving Worthington, the prairie effects very soon gave way to the charms of lake and timber scenery, which makes Minnesota one of the most lovely and picturesque sections on the footstool. Between, and around, and sometimes even through these wild and lonely lakes we travelled. Many a time, our vehicle being of a light nature, we skirted their pebbly shores, where there was no road, one set of our wheels being immersed to their hubs, and thus saving ourselves perhaps a considerable *detour* by the road.

The day was warm, and we enjoyed life in our shirt sleeves. At every bayou on the prairie, and at every lake, my friend and I went forward, creeping either through the sedges, or stealing noislessly through the timber upon the unsuspecting flocks of wild fowl, feeding in their native solitudes.

Besides our shot guns, which were 12 gauge, 7 to 7½ lb. guns, I carried a Maynard rifle, which was built under my personal supervision by the Chicopee Falls Arms Co., for heavy work on the plains—buffalo, elk, and Indians perchance. It was ½-inch calibre, 32-inch barrel, 9 lbs. weight, and shot 70 grains comfortably, besides having wonderful accuracy if *pointed* right, as they say. It was a matter of astonishment to me, wherever I went upon the great plains, and during my experiences in the Rocky Mountains, to see how clumsily the frontiersmen, whose very life may be said to be in the saddle, carried their rifles when on horseback. My first experience was at Fort Wallace, in Kansas, and I went around among the hunters the night before to gather such information as would be of value to me on the morrow. I learned much about the management of the fiery little broncho (Indian horse), how to tie the knot by which the saddle is secured, for no buckles are used in that country, where, if broken, there would be no means of supplying oneself with a new one; and many other points of value gathered from their large experience; but after trying many ways they had of carrying their rifles, I preferred the manner to which I myself had been accustomed of carrying my shot-gun on horseback among the partridge and woodcock covers at home. To be sure they manage to use them with great nimbleness, but their inconvenient manner of carrying them, either attached to the pommel in front and knocking against their shins, or else resting horizontally before them and in a grinding manner between them and the pommel, was none the less surprising to me. My method was as follows: A strong russet belt runs over the shoulder, at which part it passes through slits in a broader piece of leather to prevent the weight from cutting the shoulder; thence around under the left arm, and buckled on the chest, where the buckle is convenient for loosening or tightening, and where it is tightened till the strap encircles the body half way from the arm-pit to the waist; at this point a sliding spring snap catches the ring which moves in the small steel bar along the side of the breech of the rifle, and the rifle so attached, adapting itself to the figure, hangs with the stock level against the back, up to the height of the shoulder, while the barrel hangs vertically down behind, and out of the way if not wanted, and yet in the most convenient position for grasping for immediate use if needed. Should one desire to rest the weight across the pommel, or, grasping the barrel, to rest it over the knee, both can as readily be done as by any other method. Strange to say in my travels over the plains and through the Rocky Mountains I have never seen the rifle carried in this manner. And it seemed very strange to me that it should be so, for in moments of trouble, and perhaps peril, the riders who carry their rifles in these clumsy ways have their hands encumbered uselessly, if not disastrously. Therefore, it was no longer remarkable to me that so many tyros in the art of hunting on horseback had spoken to me of having found trouble. As quite a convincing proof of the desirability of my method to my companions, on an early occasion I allowed a fiery and comparatively unbroken horse to run with me to his heart's content, and it looked very much as if he were going to bring me out on the shores of one of the great oceans, and subsequently plunge and kick and spring about like a skiff in the chop of the English Channel; and all without comparative inconvenience to me, as my rifle adjusted itself readily to every motion behind.

Others of the party who had, on occasions, tastes of this *horse-pital* treatment suffered on account of their method, not only from the blows and raps which their rifles had given them in cavorting about their heads and shins in their mad career, but were occasionally unhorsed, throwing themselves open to the chances of having their mustang turn and finish them with his heels, if it was a vicious horse adventure, or of having their "checks cashed" by the prompt arrival of some fine old buffalo bull in vengeful pursuit.

At last, toward evening, we came in sight of the little clump of buildings with its white village spire—the prairie village of Spirit Lake, and, like a ship at sea, our ship of the prairie entered the harbor and drew up at the small hotel.

We were rather taken aback by the decidedly rude appearance of the interior of the office and of the occupants, who were smoking and lounging therein. Mr. Crandall, the landlord, showed us to a small room upstairs, of about twelve by six feet, in which there were two beds. Everything appeared clean and neat, and after having the inevitable feather beds removed and straw mattresses substituted, we managed to be very comfortable. The table also was very good, Mrs. Crandall being an excellent cook, and showing great attention to cooking things as we liked them best. Since visits made in the West in '67–'68 and '69, we notice a marked improvement in *cuisine* wherever we go. In those days the bread was always poor, and the meat, although in itself the best, so poorly served as to be quite unpalatable. The bread was generally in small, hot, doughy cakes, or as bad loaves, raised with saleratus, and served hot; the meat cooked almost immediately after killing, the steaks being pounded and mangled between patent instruments resembling those of the Inquisition, and after going through this process, fried till they resembled the prepared scalp of some departed negro. With bread and meat, the staple dishes of the feast, thus set forth, there was always a lively display of various pickles and the most indigestible and choleratic vegetables, cucumbers and the like, after which first course of, in every sense, *pièces de resistance,* came on the pies, puddings and cakes of the desert. The pastry of the pies always differed decidedly from Delmonico's, and led to the question by one interested party as to whether "these ere pies were pegged or sewed?" Warner, in his delightful back-log studies, states the *habitat* of the pie as follows: "Draw a line upon your map, beginning at Bangor, Me., curving southwardly through Bellow's Falls, and thence on to Omaha, and you have the isothermal limits of perpetual pie." But throughout this trip—North and South—west of the Mississippi, not only in the taverns, but in the most remote farmhouses, we found light, excellent bread, raised with yeast, and in many places meat sufficiently kept before cooking to be tender, and also not fried when cooked into the condition of sole-leather. It would seem as if the past five years had given some abatement to the rush which pervaded the then comparatively newly settled country, and enabled people to think a little of the amenities of life. We hope that another five years will enable a man to ask for a daily morning tub without being stared at as a bloated aristocrat or a pampered child of luxury, as he is now in the West. One man, the landlord of a hotel, in Gold Hill Camp, Colorado, who looked as if he had not taken a bath since his infant baptism, expressed to me sincere pity for the Eastern people, whom he said found it necessary to bathe and be clean. Before closing this subject, however, we must say that in certain hotels in which we have been upon this trip there still exist what used to be a prevalent fault in the large hotels of our Western towns, namely: exhausting their whole force and energy in the printing of an elaborate bill of fare, with innumerable dishes with innumerable French names, none of which were ever heard of in French, and totally unpronounceable by the waiters, and mingled in with matter-of-fact dishes, such as pork and beans, fried tripe, and pickled cabbage. These hotels also luxuriate in the elaborate ornamentation of the table with stiffly starched napkins, most grotesquely twisted up into the shape of all the animals of the ark, or of all the tombstones in Mt. Auburn. There would be no objection to all this except that there is no force left for the successful and appetizing production of the dishes themselves; they are all equally bad, equally cold, and all taste pretty nearly alike; are all served on infinitessimal dishes with microscopic liberality, so that if a man wanted to get the equivalent of the honest eighteenpenny dinner of a London tavern—roast beef and potatoes—he must ask for roast beef for *ten,* which, when he gets, resembles nearer cold *dead man.* The small care dishes receive in cooking among their innumerable companions of pots and stews of the glorious bill of fare make them all equally poor.

The town of Spirit Lake was settled before the time of railroads in Minnesota, and as chance had it, it lies thirty miles from them. The lakes are large and beautiful, and the surrounding country is the most beautiful that we have been in in the West. The bayous on the prairies are full of wild-fowl in the fall, and the prairie chicken shooting is excellent early in the season.

We started one morning bright and early from the hotel in a large double wagon drawn by a pair of mules, driven by the best natured of men, known from the first to us as "Uncle John," who keeps the best and most reasonable livery stable. This genial character amused us throughout the trip by frequent effusions of that characteristic humor peculiar to men who drive a stage. He made the best of everything, and seemed to take life as it came. At night, when, after having bestowed merciful care upon his beasts, and he came to turn in himself, finding the entire surface of the solitary mattress upon the floor covered by others, he peacefully deposited his immense weight upon the soft side of the pine knots of the floor, mildly threatening Mr. C——, who was crowing over him at being more comfortably lodged, that he would "up and set upon him"—an idea which, if carried out, would be so terri-

ble in its results that, though it amused others in the room, doubtless terrified Mr. C—— into silence.

We skirted along the shores of Spirit Lake till we came to the farm of Mr. McLeland, and in the sloughs and creeks in the neighborhood of his house we passed the rest of the day shooting. As we drove up upon the knoll of the prairie on the way thither a fine flock of geese presented themselves to view on an opposite knoll some five hundred yards distant. Taking my Maynard rifle, I crept around under the protection of the knoll till within about a hundred and fifty yards of them, and then rising from the deep prairie grass, took deliberate aim, off shoulder, at the nearest of three standing together. Quick aim was necessary, and I pulled the trigger. The whole flock rose, and it seemed for an instant I had missed my aim, but six feet from the ground one dropped back. Wading through the slough, and climbing the opposite knoll, was brought to bag, after a little scrambling through the grass, a fine specimen of this splendid bird. He was shot through the middle of the back with a half-inch bullet. At McLeland's we posted ourselves along the edge of the timber on the shore of a large slough, separated by a narrow embankment from the lake. We each had a small cluster of decoys before us. Two of the party then rowed about through the reeds in the slough, starting the birds, and giving us, as they flew over, flight shots, but the good shooting did not begin till evening, when it was particularly good, and we bagged thirty-five bald-pate widgeon and gray ducks, and one mallard only. The reason that we did not kill more was owing to our inexperience with the ground. There was on the lake an abundance of canvas-backs, redheads, and mallards. We had very excellent sport, and after a good supper of good bread and butter and excellent coffee, furnishing no real *grounds* for complaint, at McLeland's, we "turned in" there, five men and a dog, in one room, all well prepared for a sound sleep. The frightful snores ejected through the double-barreled nose of one of "the great unwashed" was at times, however, a little too much for the god Morpheus. A sharp whistle seemed to check for a moment the volcano, but it was a shortlived relief. Those alone who have experienced the delightful companionship of such fellow sleepers can participate in the injured feelings of the sleepless.

On the shores of the neighboring lake, "Okoboji," some Englishmen have built a shooting-box, and after the chicken and duck shooting in the fall, start from their pleasant headquarters on the lake out upon the plains in pursuit of elk, buffalo, black and white-tailed deer, antelope, beaver, and other large game found there. A Mr. Van Steamburg, from New York State, also has a shooting-box delightfully situated on the shores of another of the numerous and beautiful lakes. The weather continues very agreeable till after the middle of October, when it is apt to be cold and windy. The climax of the disagreeable is found later in the season in what is known as the "blizzard"—a terrible wind, full of thick but fine snow, which quickly obscures all traces of the roads, and unless very near a farm-house, which are to-day eight miles apart, necessitates the prompt encampment on the spot, and the withdrawal of all parties into the interior of the wagon, perhaps for one, and possibly for two days, till the ferocity of the storm is over. The recollections of the people of Spirit Lake are full of the sad instances of the death of those who have perished in these storms. We had a comparatively mild foretaste of the severity of the cold and wind on our return trip from Spirit Lake to take the cars at Worthington. We put on all the clothes we had, and, although in a covered wagon, still experienced severe cold, and finally, unable to endure it longer, we pulled up and passed the night at farmer Rud's, the half-way stopping-place to Worthington. Here we again experienced the good fare and hospitality of the Minnesota farmer. The cooking and heating was done entirely with bundles of hay tied up as tightly as possible. Think of using hay for fuel! It seemed, however, to burn much longer than one would expect. Now, since the invention of the Florence oil stove, which has none of the dangerous peculiarities of other oil stoves, and which cooks and warms most deliciously and thoroughly, and totally without smell or odor from the oil, besides being the most inexpensive system of cooking or heating, these prairie farmers need be no longer under the tiresome, cumbersome, unsatisfactory, shortlived and extravagant necessity of burning hay for fuel.

The next morning brought us in a few hours to Worthington and the close of one of the many little episodes of our delightful hunting trip through the West. Let any one who would derive rest from the fatigues of social or business life, seek it in an easy wandering trip, like the one out of which I recount this episode, with dogs and guns and congenial friend, through the varied beauties of the natural wilds of the far West, pursuing the deer and bear and screaming wild-fowl through the lakes and forests of Minnesota, steadying their pointers over the coveys of grouse on the limitless prairies of Iowa, tracking up the bayous and timbered bottoms of Missouri, and finally losing themselves and all thoughts and cares of civilization in the continuous and unbroken verdure of the vast Indian territory, where no roads or other human impressions mark the face of Nature, and where for days, save for the occasional tossing upon the horizon of the distant white-covered emigrant trains, jolting over their pathless ways westward, they are alone with Nature in her solitudes.

By such experience the exhaustion of business activity, or the distress of affliction, cannot fail to be repaired, and the mind and body invigorated and revivified. S. P. H.

RANGELEY LAKE TROUT TALES.

BY THOMAS SEDGWICK STEELE.

CAMP KENNEBAGO, RANGELEY, Me.

THE first visit the writer made to the Rangeley Lakes was in the spring of '73, in company with a number of gentlemen from New York, to many of whom the immense trout were almost a miracle, and the mountain scenery of this region a constant and delightful surprise.

The trip from Boston to Portland, Maine, by the Eastern Railroad, is one of little novelty to the general traveler, although the thirty minutes allowed for dinner at the latter place is of great importance, and in which he takes a personal interest. Here we change cars for Farmington, which lies eighty-five miles to the north, and is the terminus of the railroad. This place we reached at 6 P. M. After supper, at the Forest House, we transfered our rifles, rods, and other baggage to the top of the stage coach, and drawing the boot around us settled ourselves beside the driver for a long night ride of eighteen miles over the hills to Phillips.

At about 9 P. M. we stopped at a place called "Strong" for a fresh relay of horses and to take the mail; then on we rattled over the road, awaking the sleeping village by our songs and merriment, until after another two hours' ride we drew up at the "Barden House," at Phillips, happy to warm ourselves before the great log fire in its office before retiring for the night.

The brook fishing at this place is very satisfactory, hotel accommodations are good, and although, of course, not quite equal to "The Windsor" or "Fifth Avenue," of New York City, will satisfy any true angler who thinks more of his fly-rod than his dinner. At 8 A. M. we were aboard another stage coach, and with a cheer to the newly-made friends on the piazza of the hotel, we settled ourselves into our respective places, and lighting our fragrant Havanas, prepared to enjoy them and this long ride over the mountains to "Kimball's," at the head of Rangeley Lake, a distance of eighteen miles.

We were now slowly wending our way up "Beach Hill," which is two and a half miles in length, and 3,000 feet above the level of the sea, from the top of which we obtained our finest mountain view this side of camp. Away to the east, across the Sandy River Valley, lay the beautiful peaks of Mount Abraham, and as we rounded a turn in the road, old Saddle-back Mountain appeared in sight, its pine-covered sides occasionally relieved by patches of rock, showing the effect of heavy snow slides. In the early summer, when we have usually been over this road, from the 10th to the 20th of June, we have never failed to find great drifts of snow, and the sport we have enjoyed snowballing is better imagined than described. But the top of the hill was soon reached, and regaining our seats, we clattered on down hill, and soon drew up at "Kimball's" in time for dinner. "How are you Joe, and how do you do, Captain Crosby?—have we a head wind down the lake?—how's the fishing?—how many have gone through to camp this week?" were a few of the many questions asked and answered in almost the same breath. Then came the transferring of baggage to Captain Crosby's sail boat, the placing of each parcel in just the right position that the boat might "trim" to satisfaction, and then we filed into dinner, to which we did ample justice after our ride in the fresh autumn air. This hotel offers the best accommodations to anglers that can be found upon the entire route.

The Rangeley Lake is but a short walk from the house, where plenty of fine trout (and large ones too) can at any time be caught, while many fine brooks empty into it on all sides. For a ramble beside a most delicious stream, with plenty of steep rocks to climb, and good chances for torn clothing, recommend us to the brook at the left of the house, which comes tumbling down off the sides of Saddle-back Mountain.

The village of Rangeley (or the "City" as they call it) is but four miles further on, where is located another hotel with good accommodations, and it is from this point that, with tandem ox-team and sled, they "back it in" to Kennebago ponds, seven miles, which is the great trip in these regions nowadays. Pushing out into Rangeley Lake we caught the first bit of breeze, and "laid our course" for the foot of the lake, a distance of ten miles.

Never shall I forget my first introduction to this beautiful sheet of water, when, in company with some thirty other anglers, we met our guides at "Kimball's," and with two of us in each boat beside the guide, and an American flag floating from the bow of each of the fifteen boats, we kept a perfect line and rowed the entire length of the lake, our oars beating time to our merry songs. In the middle of the lake are a number of beautiful islands, while the hills on each side are wooded down to the water's edge.

At about 4 P. M. we reached the foot of the lake, landed our baggage, and after a walk of two miles through the woods, reached "Indian Rock," which lies on the right bank of the Rangeley River, just opposite our camp. We had not long to wait at the "Rock," for soon a boat shot out from the other side, and we were the next moment heartily welcomed by the Superintendent, Mr. C. T. Richardson, whom we have since nicknamed "Rip Van Winkle," on account of his long gray hair and beard. By him we were then introduced to our guides, and assigned to our boats, cauls, and sleeping apartments, all of which were numbered, even down to our lunch-boxes, for we were to retain them all during our entire visit at camp.

Camp Kennebago, or the headquarters of the Oquossoc Angling Association, is situated at the junction of the Rangeley and Kennebago Rivers (two small streams, each about two-thirds the size of Little River at our park), which are easily forded at any time during the year, except for a week or two in the early spring. At their junction they form the Rangeley River, and after flowing for about half a mile empty into the Mooselucmaguntic Lake.

The main building is of wood, one hundred feet long, thirty-five feet wide, and about twenty-five feet to the ridge-pole. It has a piazza which runs half way around it, and between each rustic pillar are swung hammocks, for the enjoyment of the guests, while on the sides of the house are wooden pegs on which to place our rods, after the day's fishing is over. This building contains three rooms, the largest of which is some seventy-five feet in length, and is our sleeping apartment, containing about twenty beds, which are arranged up and down the sides of the room in hospital order, with only small space between each.

At the right of this main camp is another log house of smaller dimensions, and divided by means of birch bark partitions into four rooms for the accommodation of the officers of the Association, and is called "Bald Eagle Camp." In the rear are the guides' camp, joiner-shop, barn, and other buildings, and I must not forget the ice-house, located near the landing, nor the graceful flag-staff in front of the camp, from which float the flags of our country and the Association.

In front of the camp the ground slopes gradually down to the water's edge. Sitting on the piazza of the large camp, one has a fine view of the Kennebago Falls, and the lovely bend in the Rangeley River, as it sweeps outward to the lake. Being over 1,500 feet above the level of the sea, the air is pure and delicious—strengthening and exhilarating one to such an extent that no tramp in the woods seems too long, and no exertion too great.

Our boats are built with keel, and are heavier than those used in the Adirondacks, as there are no "carries" or transportation of baggage from one point to another. The president of the Association is the happy possessor of a birch canoe, which is the only one at camp.

To the stern of each boat is attached a small fish cauf, pointed at the end to offer as little resistance to the water as possible, and into this is placed every trout that is captured, so that he simply changes his place of residence, and lives in the same pure water. Each guest at camp also owns for the time another cauf, four or five times as large as the first, and into this he transfers the success of each day's trip. These cauls are generally anchored in some shady nook by the bank of the stream near camp, and as I said before, all numbered, so that whether an angler stays one week or two, the products of the entire trip are kept alive until he departs.

On leaving camp the trout are carefully dressed, hung on pegs in our ice-house over night to dry, and then each fish is wrapped in birch bark, packed in sawdust and ice, and is ready for transportation. Early rising is not considered a virtue at camp, but all newcomers are allowed the privilege of going out once before breakfast! It is hardly necessary to say that this effort is never repeated! In other words, we very seldom meet with good success in the early morning, or until the sun warms the water to a certain degree so that we breakfast at 8 A. M., and after enjoying a smoke and promenade on the spacious piazza, we call our guides, who appear with the lunch boxes already filled, then with rods and landing nets over our shoulders, we step into our respective boats and are ready for the day's sport.

Some go up the Rangeley and Kennebago rivers, while others take to the lake or Cupsuptuc Falls, the latter of which is some ten miles distant, and is one of the pleasantest spots in this vicinity. Dinner, the principal meal of the day, occurs at 7 P. M., or after all have retured to camp, and the mutual exchange of experience through which each has passed during the last ten hours makes *that* hour enjoyable to all. It is at this time we narrate "big fish stories," which call forth applause from some and serious doubts from others.

I shall never forget an incident that happened to me one day on the Rangeley River. The first part of the afternoon had been occupied in cleaning my gun and putting numerous other traps in order, but at 4 o'clock, the storm having abated, I called my guide, and buckling on my invincible "mackintosh wading pants," we strolled up the stream. We found "Indian Eddy" was as well patronized as usual, and at that time many a speckled beauty was leaving its ripples to be soon transferred to the cauls dancing attendance at the stern of the boats. So on we pushed, occasionally taking a fish, until we reached a certain position on the stream. Oh! shall I whisper where?

Suffice to say that it was beside a certain overhanging bank, near a certain number of handsome fir trees, and that an old dead stump around which you can just clasp your arms, reflects itself in the stream, and furthermore, that said stream at this time is about four feet deep; and if by this description you can discover my secret, you are welcome.

Getting to the lee of a "smudge," built by the guide to get rid of the angler's pests, the black flies, whose supply always more than equals the demand, I fastened to my line the most tempting treasures from my fly book, and made a cast far out over the charming waters. Thinking the flies did not alight on the water to my satisfaction, I was about making a back cast when a gleam of silver far down under the dark waters, a rush, a splash on the surface, and the next moment my stretcher fly was fast in a pound trout. Placing my finger on the line above the reel, I realized he was firmly hooked, and I prepared myself for the battle which was sure to follow. A pound trout is not much to handle with plenty of room, but take overhanging boughs, a slippery bank and a wild rushing river, and the odds are frequently in favor of the fish.

The Rangeley River, flowing from the lake of the same name two miles through the woods into Mooselucmaguntic Lake, acquires great force in its descent, and when wading, it is with difficulty you can maintain your toothold even when only a short depth in the water. Many an angler has mistaken its hidden force, and while wading that stream capsized in its turbulent waters and risen to the surface "a sadder but wiser man." So with the fish tugging away at my line (as a trout only knows how), it required great skill and careful management not to lose him, or be upset myself. A few wild rushes up and down the stream, occasionally showing his gleaming sides near the surface of the water, bending my eight-ounce rod as if it were a twig, and with mouth wide open, he soon lay exhausted on the bank. Then another cast, and another fish of about the same proportions, followed by others still of 1¼, 1½, and 2 pounds each, my flies hardly touching the foaming surface before they were eagerly taken by the voracious fish. Sometimes two or three would spring for the enticing flies at the same time, and my past idea of the delicate sense of a trout was badly shocked by their selfish exhibitions of character. For two hours, the shortest I ever experienced, these trout kept me busy, and sometimes when giving them the final blow, bending my split bamboo three feet below the butt, while my faithful guide stood at my side, net in hand, transferring the fish to the cauf as fast as possible. You who take no zest in outdoor sports, or rambles by forest and stream, and think with the old adage "that angling is merely a stick and a string with a fish at one end and a fool at the other," what wouldn't I have given to have placed you suddenly in my position, and if the blood in your veins didn't course more freely after such excitement, then you must be as dead to all enjoyment as the Egyptian mummies in the museum at Niagara Falls. But as "all things have an end," so did these joyous moments, which were finally brought to a close in a more hasty manner than I anticipated.

For the last ten minutes the trout had ceased to rise, and we had concluded that we had either exhausted the pool, or by repeated casts had frightened them away (for we had not moved three feet from our first position during the whole time), when letting my flies float slowly under the big stump, I was immediately reminded that one fish at least was left to tell the story. Taking the fly greedily, as if he meant business, he dashed up the stream with lightning speed. Checking him in his wild career by "giving him the butt," I succeeded in turning his head toward me, when away he went, backward and forward, across the stream (which is some twenty feet wide), and then down into the most turbulent and rapid of the water, making my reel hum like a buzz-saw. Now I tried to hold him a little, which brought the tip of the rod at the water's surface; now he would sulk under some mossy bank or overhanging rock, from which I was obliged to rouse him, until finally he dashed for the middle of the stream, where he wound the line around and around an immense boulder. Plunging into the water up to my waist, I routed him from his fortress, when away he started down stream around a curve in the river, dragging my line through the alders and brush which lined the water's edge, while over the slippery stones and through numerous holes I followed till he had exhausted over one hundred feet of my line. Then I finally succeeded in stopping him, but against the wild rushing water, which boiled around me, I could only hold him. The guide now hastened to my side, and held my rod, while, following the line through the middle of the stream, I held it firmly half way between the guide and trout. Guide then reeled up the line to where I stood, and handed me the rod, and I congratulated myself on having gained fifty feet. But it was only for a moment, for I again started the fish, and away he dashed down the stream, carrying with him the fifty feet of line I had just gained. I was now determined to get him at all hazards, and "giving him the butt again" I brought him to bay. My guide now went ashore, and with net in hand disappeared among the bushes to look up his lordship's headquarters, while I followed carefully down stream, full of anxiety and suspense. Some time after the slackness of the line told me I had either lost the prize or "William" had

secured him for me; the line was free, at all events, and I patiently waited the result. Finally, to my delight, the guide appeared, triumphantly bearing the net with my treasure safely secured in its meshes. He had captured him over one hundred feet from where he had left me. The trout turned the scales at 2½ pounds, and was one of the finest specimens of the *salmo fontinalis*, as regards color and proportions, that I ever landed. We reached camp at 6½ o'clock P. M., having been absent only two and a half hours, half an hour of which I was occupied in going and returning from camp.

Throwing back into the water a number of the smaller fish, we weighed the remainder, which numbered forty-eight, and they turned the scale at fifty-six pounds. Since that day I have caught my two, three, and even six pound brook trout, and have experienced a variety of emotions while enjoying their capture, but I look back to the time when I landed with an eight-ounce rod forty-eight trout, weighing fifty-six pounds, in two hours' fishing, as the most successful day in my whole experience.

(To be continued).

For Forest and Stream.

BASS FISHING IN VIRGINIA.

I UNITED with half a dozen friends last summer for a trip to Berkley Springs, Va., kept at that time by the well-known Kirkwoods, formerly of Washington, D. C. Four of our number I know prided themselves on their expertness as anglers, and a spirit of rivalry induced us to make a raid on the Potomac River, which was about two and a half miles from the Springs. Before starting, we secured the services of one Fitzmiller, the most knowing and experienced fisherman in the neighborhood, who had a satisfactory reputation, besides being the owner of a pair of horses and coach. On the second morning after our arrival we started over the mountain to Sir John's River, and drove up to the dam some five miles away. At that point we found the river quite muddy as we had found it below; but in the canal, which was fed by the dam above, the water was in fair order. Here we fished several hours with poor success, catching some fifteen bass. Early in the morning next day we set off for Capon Creek, over a rough road and high mountain, walking at least half the way. Arriving at the creek about 9 o'clock we went to work, all anxious for the first fish and the heaviest basket. I attached myself to Fitzmiller, leaving the others to look out for themselves. With bait-fish the party caught about a dozen, when my companion advised me to go with him up to the "riffles."

We worked our way up the bank of the stream about half a mile, and then pitched in, side by side. He fished with two hooks, while I had but one. After catching several, I ventured to try the fly, which I at once substituted for the bait-fish. Fitzmiller seeing what I was doing, said "that he and his friends had often tried the fly, but could do nothing unless they added the bait-fish in order to sink the fly." I said nothing, but commenced to make my casts—with a "red ibis." In a short time I caught four. Then I changed from the ibis to a Ferguson fly, with which I had as fine sport for two hours as any fisherman could ask for. I did not try the still, deep water as it was difficult to throw from the banks, which were lined with trees, but confined myself to the shallow water and to the head of the pools. In the time mentioned I caught twenty-eight bass, averaging three-fourths of a pound, and more than the total catch of my five companions—this, too, without any trouble or exertion. Once, standing upon a rock, which was fully three feet out of water, with a still pool below me, in plain sight of the fish, I made a cast over near the bank, under the trees; I saw the fish start from his hiding place; just as he was taking the fly I hooked him, I imagined I could see a look of surprise on his countenance.

Our total catch was fifty-four. I do not believe that I ever in such a short space of time had as much sport; and that day fully proved to my mind that the bass will not only take the fly, but prefer it to any other bait. I found the Ferguson fly the most taking, and will try the experiment this summer to prove that my convictions are correct. S.

A GOOD JOKE.

HANOVER, N. J., April 6.

EDITOR FOREST AND STREAM.

One cold spring day we, three friends, Dr. C——, John K——, and my worthy self, started out to try our luck at snipe.

There had been a heavy rain, therefore the water was high, and I, being leader of the party, concluded we had better take a boat, and as the wind was quite fresh, use the sail. But, alas for us! we little dreamed what mischief *that sail* could do.

All went well for a while; we had a good run of luck, bagged a good bunch of birds by wading from one ridge to another, and through all kept dry, which was comfortable, to say the least. But when the noon had approached we began to feel the need of something to brace up the inner man, and for that important reason prepared to return home, well satisfied with our morning's work.

As we seated ourselves in the boat, John complacently said, "Isn't it good we have kept dry?"

At that moment I took the tiller, but turned quickly as I heard Dr. C—— exclaim, "Keep still, John." But poor John! the sail swung around suddenly, the rope caught him about the neck, and pulled him backward, leaving his feet only in the boat. He had his gun in hand, and that soon went to the bottom, and John's feet concluded to follow his body, so over they went. But misery loves company, and poor John, trying to gain company, or save himself from a ducking, clutched Doctor by the coat, and pulled him over also. Doctor's gun followed the other, while John succeeded in finding bottom, and stood in meek and trembling submission up to the neck in the cold water, while Doctor made bold strokes for the shore.

"Swim, John, swim!" I cried, trying in vain to look a little sober and sympathizing, and the poor boy did swim, and the two companions in peril of a cold reached the shore panting like porpoises.

I could restrain myself no longer, and laughed till echo answered me; for there stood the two shivering boys, with coat pockets standing out with water, their whole suits weighty with the same heavy element, Doctor's hat lost, and both guns reposing in the river.

"How are those guns to be recovered?" asked Doctor, with chattering teeth and woebegone face.

"We must dive for them, as we would for pearls," said I, as I produced a great red handkerchief, which the Doctor tied over his head, making himself more ridiculous looking than before. Then I stripped off my clothes, and went into the cold water for the lost guns, which I recovered after groping about a little. As soon as we were once more ready we started for home and reached it this time in safety. Dry clothes were put on, and we crowded around the fire, laughing and talking about the accident; and friends, we thought you would like to laugh with us, so I give you this account.

A. D. W.

BALDWIN'S RANCH.

WONDERS OF A FAVORED REGION UNDER CALIFORNIA'S SKIES.

LOS ANGELES, *March 5th.*—By rail it is eight miles to the mission of San Gabriel, thence four to the magnificent domain of Mr. Baldwin. A pair of thoroughbreds, guided by the hands of an intelligent darkey, formerly body servant to Stonewall Jackson, brought me to the residence, which is an unpretending, cosy, comfortable-looking structure of one story, originally built of adobe, by, I believe, Mr. Wolfskill, but refitted and remodelled by its present owner with every convenience and comfort. In front of the cottage is a beautiful artificial lake, where handsomely-cushioned pleasure boats always await your orders. As I write, from my window on this lovely morning—for it is like the month of May—the view and surroundings are exquisitely beautiful. In the distance the coast range of mountains, "rock-ribbed and ancient as the sun," with their zigzag summits and tops, seem as if cut by the hand of the artisan, backed and covered by a bright blue sky and a warm summer sun, giving every variety of shade and color to the plumage of the mountains, just now coming out in its spring livery and reflected in the lake below in a thousand fantastic shapes and forms; while from my back window birds are carolling among the bright green trees, the sheep bells tinkle cheerily, and in the distance the cheery hum of labor unites with the still, small voice of nature to enchain, please, and enchant you.

Think of this, ye that are wrapped up in furs, chilled to the bone, or up to your knees in slush or "beautiful snow" in the Eastern cities, or in foggy London, and come right out here and enjoy the ravishing sweetness of this garden spot of the earth! And as another pleasant item for the dwellers and guests of his new hotel in San Francisco—strawberries, raspberries, gooseberries, and currants, melons, peaches, pears, cherries, and such apples! will be theirs to enjoy and demolish.

I have just inspected the "pig-pens," and such a sight I have never witnessed in any English or American "farm yard." A hundred head of great, big, fat hogs, fed with the finest "corn" (for I saw piles of it uneaten), will be on Monday next driven to the Bay City, to be duly slaughtered and made into hams, bacon, and lard; while from my open door, as I am writing, turkeys, geese, chickens, and such birds! keep up an incessant noise. Mr. B. has also some 12,000 head of sheep on his ranch, having the finest pasture lands for their grazing. The race track for the thorough training of his horses is one of the finest, one mile in extent. Going to the stable I saw seven beautiful fillies, now being trained, brought from Sanford's stables, Kentucky. Here he keeps the celebrated racers, Grinstead and Rutherford, from Alexander's stables, Kentucky, and they will soon luxuriate in the Kentucky blue grass and timothy hay seed which is being sown for their express benefit. The wine house is quite a feature of the place, stocked with the choicest sherries, ports and brandies; but belonging to the temperance society of Brother Battur's Dashaways, I did not indulge. There will be no sale for this three or four years, so that when it does appear it will astonish the natives at home and abroad.

On Wednesday last we took a most delightful drive over roads as fine and well macadamized as any in the world, stopping first near the site where it is the proprietor's intention to commence next year to build.

The avenue running north and south is five miles in length, three miles of which is planted on either side with orange, fir, gum, lemon, magnolia, india-rubber, and other trees, and you can imagine the effect on a bright, moonlight night, while elsewhere all is cold and leafless. Here the golden fruit, lit up with the silver tinselings, nods approvingly at you as you pass, and occasionally drops for your acceptance a ripe and luscious offering. The two ranches together, Santa Anita and San Francisquita, contain about 16,000 acres, of which there is about 5,000 under cultivation, and next year it is Mr. Baldwin's intention to have the most of his ranch under culture and entirely fenced in. He has just finished putting in about 100 acres of the best varieties of foreign grapes—among them 30 acres of the finest raisin grapes—and he is now ploughing for a large peach orchard. Of orange and lemon trees, etc., he has about 14,000 already planted, many being of the finest quality of naval and blood oranges brought from Australia, also Lisbon lemons. He has also a magnificent orchard of English walnuts, almonds, chestnuts, shell bark, hickory nuts, black walnuts, butternuts, pecans, and Brazilian nuts; also cocoanut, coffee, and every variety of fruit-bearing trees that can be imagined, and only yesterday I plucked a ripe banana from a tree near our porch.

A knoll of splendid, fine old oak trees, of every form, shape, and size, stand like sentinels about the spot, sheltering you from the summer's sun beneath their cool and grateful shade, while you are encircled by the friendly arms of the coast range of mountains, with their precipitous steeps and vari-colored folinge; and fronting you, delighting your vision, is spread out a panorama of matchless beauty—landscape, vale, hill, and valley—while in the distance the white-crested waves of the Pacific can just be seen, like a sheet of silver threading the way to a tropical southern sea. The land for the immigrant is indeed here; and right well is Mr. Baldwin caring for the future of this place, its surroundings and its people. Here, at the depot of San Gabriel, were thousands of feet of lumber for the purpose of putting up a colony of farmhouses, many of which, capitally built, are already erected; and as we drove through two or three pretty little villages, with their school-houses, churches, taverns, and corner groceries, occasionally we hear the whistle of the steam engine, and the rushing train of the Southern Pacific Railroad carrying its burden of freight and passengers to the Colorado River.

CONSUMPTION CURED.—An old physici an retired from active practice having had placed in his hands by an East Indian missionary the formula of a simple vegetable remedy for the speedy and permanent cure of Consumption, Bronchitis, Catarrh, Asthma, and all Throat and Lung affections, also a positive and radical cure for Nervous Debility and all nervous complaints, after having thoroughly tested its wonderful curative powers in thousands of cases, feels it his duty to make it known to his suffering fellows. Actuated by this motive, and a conscientious desire to relieve human suffering, he will send, free of charge, to all who desire it, this recipe, with full directions for preparing and successfully using. Sent by return mail by addressing with stamp, naming this paper, Dr. J. C. STONE, 32 North Fifth Street, Philadelphia, Pa.—Adv.

Fish Culture.

THE HAMBURG AQUARIUM.

BY DR. H. DORNER.

Continued from page 308, Vol. VII.

WE used to have, permanently, three species of the family of Labridæ, the goldsinny or corkwing (*Ctenilabrus rupestris*), and two kinds of wrasses (*Labrus mixtus* and *maculatus*). The former, a pretty orange-colored fish, the length of which seldom exceeds six inches, is one of the most lively animals; almost constantly in motion, it slides through all holes and caverns, sometimes swims near the bottom of its tank, sometimes near the surface, and is so quick in its observations and movements that it is already catching and swallowing bits of food when other fishes just begin to perceive it. But this liveliness is exhibited only during the daytime; with the beginning of darkness it gets quiet, seeks its usual resting-place, and keeps there motionless until morning. Mr. W. A. Lloyd was the first to make this observation, which has since been confirmed by many persons. Coming after dark into the aquarium and looking for the fishes by means of a lantern, none of the numerous goldsinnies are to be seen swimming. Some of them are reposing on their belly upon flat stones, others upon suitable places of the bottom, or leaning with their sides toward the rockwork, the head higher than the tail, and the belly directed obliquely against stones. If the light falls directly upon their body they are very slow in getting disturbed, and only after a considerable time begin to move. Sometimes, if the light shines into their eyes, they will change the position of their body so as to be less affected by the glare, and if at last they begin to swim, it is done in a dull, sleepy manner. In the short days of December and January they went to their resting-places already between three and four P. M., and remained there until dawn. There was no other fish in the aquarium that showed such a diversity of character in day and night; none that was so difficult to arouse during the latter time.

The wrasses were the most gorgeous fishes exhibited in our aquarium—the most gorgeous, indeed, of all the fishes which occur in the northeastern part of the Atlantic. They are found in the Mediterranean and all along the western coast of Europe; most abundantly on the coast of Norway. Eakstroem, a Norwegian naturalist, thus writes of them: "Among the sea fishes, none can compare with the wrasses in regard to beauty. They are, in this respect, a marked exception to the general rule—that the further one proceeds to the North, the more uniform and dull are the colors. He that rows out to fish on the Western coast, and for the first time sees a wrasse recently taken out of the water, may therefore readily imagine himself transported, as if by magic, to a tropical climate, and waits, with impatience, for the next nibble, that he may behold another of the paradoxical beings that abound in these seas. But the illusion is of short duration, for when the line is again hauled in, instead of a fish with colors of the rainbow, a codfish or a flounder is brought to the surface."

There is another peculiarity in the natural history of these fishes, viz.: the diversity of colors of the two sexes. The male of the variegated wrasse (*Labrus mixtus*), a fish seldom exceeding one foot in length, is richly striped with irregular longitudinal bands of the most brilliant ultramarine blue, on a ground of greenish-bronze, of a metallic tint. Some irregular spots of ultramarine adorn the head and gill-cover, and border the yellow fins. Thus, blue being the prevailing tint of the male, it is remarkable that the body of the female does not show a single spot or line of this color. The upper parts of the latter are red orange, interrupted in the hind part by three large spots of deep purple, alternating with four light rose-colored ones, which give a totally different aspect from that of the male. It has been ascertained but lately that these two fishes really belong to each other, the male having been known as the blue-striped wrasse (*Labrus lineatus*), the female as the three-spotted (*Labrus trimaculatus*).

Numerous fishes belonging to the family of Triglidæ were exhibited. We kept the sea swallow (*Trigla hirundo*), the grey gurnard (*T. gurnardus*), and the little gurnard (*T. pecilopterus*). For the general appearance of the gurnards we refer to the nearly allied genus Trionotus, several species of which are found on the New York shores, one of them (*Tr. carolinus*) being exhibited in the New York Aquarium. These fishes are remarkable for the form of their head, which is nearly square, and resembles a box used for preserving a brooch and earrings. Besides, they have very large pectorals, folded like fans when the fish is resting, and giving a bird-like appearance when expanded. In the sea-swallow they are edged with a broad blue border. In front of or somewhat below these large fins, which enable the fish to swim with an astonishing rapidity, there are three appendages or free rays of the pectorals, used as feet, or rather fingers. They can be moved separately, are ever feeling the surface as the fish glides along, and thus are used as organs both of motion and touch, enabling them to approach and discern small animals, such as shrimps and worms, without disturbing them. They lived very well in our tanks, and became so tame that they used to come near the surface when a person approached it, stick their heads out of the water and allow themselves to be touched. The same could be done to some of the larger codfishes and wrasses.

The fatherlasher (*Cottus scorpius*) is a fish of about nine inches in length, provided with spines and thorny warts, with a very broad head and an exceedingly narrow tail. It is not very lively; swims but little, and is ever watching for something to eat. If some small fishes or shrimps are thrown into its tank, its darts forth from its hiding-place, snatches it and immediately turning round retires to its hole. Sometimes we received some allied species, such as *Cottus bubalis*, *groenlandicus*, and *quadricornis*.

I need not give a description of the manners of sticklebacks, everybody being familiar with them. I only mention that besides the common ones we also kept the large marine

species (*Gasterosteus spinachia*), which, notwithstanding its being about four times as large as the three-spined stickleback, was less active and vigorous than this interesting little fellow. When kept together it took but little time for the latter to make piece-meal of the cousin, generally beginning at the tail.

Besides the sticklebacks, the nest-building of which was one of the most interesting sights in the aquarium, there were kept several other fishes that could be observed bringing forth eggs or young ones.

The viviparous blenny (*Zoarces viviparous*), or, as it is called in Germany, the "mother of eels," a fish seven to fifteen inches long, has a slight semblance to the common eel. Its body is lengthened and somewhat compressed, higher than that of the eel; its dorsal fin begins close to the head, and unites with the caudal and anal fin, thus forming a continuous edge round the greater part of the body. The narrow abdominals are situated in front of the pectorals. This fish brings forth its young ones alive. Previous to my engagement at the aquarium I had often heard and read of this very remarkable mode of development in fishes, and I therefore eagerly watched the numerous specimens which were kept in different tanks, intermixed with other fishes. Early in April, 1872, I observed that one of the larger specimens, which I took for the male, almost continually accompanied one of the others, while prosecuting its rivals, and that it sometimes rubbed its body along that of its chosen mate. After having continued this behavior for several days it was observed that it tried to wind the hind part of its body round that of the female, and that both of them were lying immovable for about one minute. The body of the female was nearly straight, whilst the male evidently made every exertion to bend its body as much as possible and to keep close to the female. It was not to be doubted that a real copulation took place, an event which we saw repeated three times in one day by the same couple.

The abdominal cavity of the blenny being extremely short, the female presented an ugly appearance five or six months afterward, when near the time that the young ones were hatched. To save these from the attacks of other fishes, we put the female into a solitary tank, and observed that about three hundred young ones were born in two days, each of them more than two inches long, without any visible rest of the yolk. Several other females, got at different times from the sea—they are found both in the German Ocean and the Baltic Sea—deposited their young ones in our tanks nearly in every month from November until March, and the larger the parent fishes, the larger were also the young ones, the length of these varying from one and a half to three inches. Although fed very carefully with chopped liver and mussels, only a few of them were kept alive, most of them dying in about a fortnight.

The newspapers often repeat the story that at last the discovery of the eel's development had been made, but invariably a viviparous blenny has been mistaken for this fish. Somebody tells that he has found a lot of young eels in an old one, and to give a convincing argument to his revelation, he draws from the life—a blenny. Even papers of a world-wide circulation, such as the German *Gartenlaube*, made this blunder. It may be added that the development of the eel is a secret no more, only the eggs are of such an extreme diminutiveness that it requires a powerful microscope to see them.

(*To be continued.*)

PROGRESS OF FISH CULTURE IN CANADA.—We append herewith a memorandum of fish eggs laid down in the several Government fish-breeding establishments in Canada during the autumn of 1876, as given in the *Canadian Illustrated News:*

Newcastle (Ont.)—Salmon eggs, 1,500,000; whitefish eggs, 150,000; California Salmon eggs, 10,000.

Sandwich (Ont.)—Whitefish eggs, 8,000,000.

Tadousac (Que.)—Salmon eggs, 1,000,000; sea-trout eggs, 30,000; California Salmon eggs, 5,000.

Gaspé (Que.)—Salmon eggs, 920,000.

Restigouche (Que.)—Salmon eggs, 640,000.

Miramichi (N. B.)—Salmon eggs, 640,000.

Bedford (N. S.)—Salmon, 1,000,000.

The first practical experiments with fish culture in the Dominion originated with Mr. Wilmot at his private residence in Ontario in 1865. Three years afterward, when its benefits were made known, it was adopted by the Government, and has since been extensively carried on in several of the Provinces. The rapidly increasing popularity of the industry, together with the marked success which attended its operations, has had the beneficial effect of inducing the Government to erect six additional fish-breeding establishments (beyond the original one at Newcastle) in the Maritime Provinces and in Ontario. The Restigouche, a famous salmon river, dividing New Brunswick and Quebec, had one built upon it in 1872. During the following year two more were erected, one at Gaspé Basin, the other on the Miramichi River; following these, another was put into operation at Tadousac, at the mouth of the Saguenay River. In 1875 a salmon hatchery was built at Bedford, near Halifax; during the same year the largest fish-breeding institution on this continent was erected at Sandwich, on the Detroit River; this one is especially adapted for the artificial propagation of whitefish.

That our readers may be enabled to comprehend more fully the importance of this enterprise and the amount of benefit which has already been derived from it, we give the following statement, taken from official returns, of the numbers of *young fish* which have been distributed from the Newcastle establishment:

Consisting of salmon, salmon-trout, and whitefish, which have been reared in it	5,125,000
There are at the present time in the several breeding-rooms in the course of hatching out—*living ova* of salmon, trout, and whitefish, and California salmon, amounting to	1,775,000
Making a total from this hatchery of	6,900,000
From the other hatcheries in the Dominion, the young salmon and whitefish which have been planted in many of the rivers and other waters amount to	9,215,000
There are also on the hatching trays of the several buildings in the Maritime Provinces and at Sandwich, vivified eggs of the salmon and whitefish numbering	12,400,000
These added together form a grand total of fry and fish-eggs of the most valuable species, which have been produced at the several fish-breeding establishments for distribution in the waters of Canada, amounting to	28,515,000

A NEW TROUT FARM IN IOWA.—Mr. M. M. Moulton, of Monticello, Iowa, sends the following information:

Ex-Mayor C. E. Wales has purchased a small spring farm of sixty acres, one mile east of the city limits, and has commenced to dry it up for a regular trout farm. He expects to put upon it 10,000 trout fry in addition to other fish, and commence fish-raising on a large scale. It will be the first of the kind in this part of the State. The land is naturally adapted for a first-class fish-culture farm. He will have two large living springs of water issuing from the bluffs on the Maguoketa River, a hundred feet above high water, and neatly arranged so as to have a good fall between each fish race; and if the venture proves successful, he will add to it from time to time as the business will warrant.

Respectfully, M. M. MOULTON, Marshal.

Natural History.

A SHORT LECTURE ON FISHES.

BY ERNEST INGERSOLL.

OF all the animals composing that great branch of the animal kingdom called vertebrates, the fishes are the simplest in structure and intelligence, and are the oldest in the history of the globe, as shown by the remains in the rocks. Fishes being destined to an active life under water, have all their organs adapted to this purpose—gills instead of lungs, limbs shaped as fins, and so forth. They differ in form, but all have the simple outline of a large head, no neck, and the body tapering gradually to the end of the tail. Some have no fins, but generally they are present, and arranged in pairs symmetrically, or singly on the back or abdomen. Behind the head are large openings leading to the gills. The water entering the mouth in breathing, is driven across the gills and escapes by these openings. The scales greatly vary, their shape forming one of the characters by which a fish is classified. They are horny plates similar to our finger-nails, containing minute, polished plates of color, giving certain fishes a dazzling brilliancy of tinting that reminds us of gold and silver.

The skeleton of fishes is either horny or made of cartilage, which is a tough, elastic substance, better known as "gristle." It is composed of a head, trunk, and limbs. The head is made up of a large number of bones intricately put together, particularly those supporting the arches of the gills and the gill-covers (*opercula*), the tongue and neighboring parts, which has been termed the *hyoid* apparatus. Next behind the skull comes a chain of bones called *vertebræ*, extending the whole length of the body. Each vertebra is shaped like an hour-glass, and is armed with spines and projections termed *processes*, some of which, by interlocking, hold the vertebræ more firmly together, while others give a strong attachment to muscles. This chain is the back-bone or vertebral column, which, by its presence in every fish, bird, reptile, and mammal, unites them into a single group—the *Vertebrata*. Above the backbone runs the *spinal cord*, that is the great nerve, which is a continuation backward of the brain, protected by a bony tube, and underneath it the great artery from the heart that supplies the body with blood. To the sides of the backbone the ribs are all attached, when present, and upon the spiny processes which project upward is carried the frame-work of the fins of the back and the tail. The side fins are supported upon the end of some flat bones hinged to the backbone, which answer to the fore-limbs in higher animals, but the ventral or belly fins are fixed more simply. The skeleton in fishes like the sharks and skates is very different, not being bony at all, but composed entirely of cartilage; hence they have been named *cartilaginous* fishes.

Most fishes swim with great rapidity, using their tail alone to get ahead with, balancing and steering somewhat with their fins. Many possess a very peculiar organ, called the *swimming-bladder*, situated in the abdomen. This is a sac filled with air, and so arranged that the fish can increase or decrease his weight with respect to the water (*i. e.*, his specific gravity), and so sink or float; as he desires.

The life of a fish is occupied wholly in providing its food and escaping its enemies; its senses are dull, and it seems to be without any remarkable instinct. Yet it has a brain, abundant nerves, and all the organs of sense. Fishes are great eaters, and nearly all live upon flesh. Some have no teeth, but generally there are large numbers in different parts of the mouth and throat, which vary widely in form, number, and position. The horrid set which the shark carries is regularly shed and replaced by new. The blood of fishes is red and cold, but it seems to circulate slower than in warm-blooded animals, and the heart is more simple. Some fishes, like the electric eel, have the remarkable power of producing electricity. These eels swarm in the smaller streams of South Africa, and, when roused, can give so powerful a shock as to kill men or cattle. The natives first drive horses into the water, upon which the eels expend their force, then they are easily taken, for they require a rest while accumulating more electricity. The torpedo and other fishes possess this faculty to a less degree. Fishes multiply by means of eggs, some species producing hundreds of thousands at a single spawning—as the dropping of the egg is called; yet perhaps not more than one in a thousand of these eggs ever results in a full-grown fish.

Certain fishes change their residence with the seasons, or according to their habits, especially their habit of spawning. This migration in some is from north to south; in others from deep to shallow water and back again; and in many from the sea up rivers and down again to the sea. One of the best known examples of this latter class is the salmon, and I will give you a description of their habits in the words of Milne-Edwards, an eminent French naturalist:

"Each spring it enters the rivers in vast troops to ascend them, even to their sources. In these migrations the salmon follow a regular order, forming two long files, united in front, conducted by the largest female, who precedes, whilst the small males form the rear guard. These troops swim in general with much noise in the middle of rivers, and near the surface of the water if the temperature be mild, but nearer the bottom if the heat be great. In general, salmon advance slowly, sporting as they proceed; but if danger appears to threaten them, the rapidity of their course becomes such that the eye can scarcely follow them. If a dyke or cascade opposes their progress they make the greatest efforts to overcome it. Resting on some rock, and extending the body suddenly and with violence after being curved, they spring out of the water, leaping occasionally to the height of fifteen feet in the air so as to fall beyond the obstacle which stops them. Salmon ascend rivers even to their source, and search in the small streams and tranquil places a bottom of sand and gravel adapted to the deposition of their eggs. The eggs are deposited in a trough dug by the female in the sand; they are afterward fecundated by the male. The young salmon grow very rapidly; and when they are about a foot long they leave the rivers to repair to the sea, which they quit in its turn to again enter the river * * * toward the middle of the summer that follows their birth."

These periodical visits are taken advantage of by fishermen, and it is then that all the salmon, herring, mackerel, cod, and other fishes we use, are caught and cured.

I have no doubt you will be satisfied if I only mention the classification, and I have little time to do more. It is a very large class and contains four sub-classes—The *Myzontes*, the true *Fish*, the *Ganoids*, and the *Selachians* or cartilaginous fishes. The myzontes are so low and shapeless that they were at one time classified with worms. Many of them live as parasites on other fishes; some holding on by means of a round sucker-mouth, like the lamprey eel. The true *Fish* belong to two orders, separated by the shape of their scales, which in such fishes as the perch and most of our fresh-water species are jagged and comb-like along the posterior edge, while in the case of our friend the salmon, the scales are round and smooth at the edges. This sub-class includes about two-thirds of all the fishes, and are the easiest examples for you to study.

(A) *Ganoid* fishes are well represented by the gar-pike or bill-fish of the western rivers and the common sturgeon. The main part of this group, though, consists of fossil fishes, which are found in the same rocks from which we get our soft coal. Many of these odd fishes who perished so long ago looked very much like small alligators, and others were like our bill-fishes and fikes.

To the fourth and highest sub-class belong those fishes like the sharks and rays or skates, that, instead of a bony skeleton like the true fishes, have one of cartilage. The sharks are noted for their ferocity and their insatiable appetite. They abound especially among the coral islands of the Pacific ocean, where the people spend about as much time in the water as on land. But so accustomed do they become to them and so fearless, that it is said an Islander does not wait for the shark to rush upon him, but attacks him instead, with only a knife or sharp stick for a weapon, and generally conquers. The sharks are obliged to turn over to seize anything, their mouth being a good ways back from the end of the snout, which gives the swimmer an opportunity to plunge in his knife. All sharks, however, are not so large. The rays or skates, or their cousin the torpedo, are also flesh-eaters, but not so fierce as the sharks. They are easy to recognize by their nearly square shape, with the head at one corner and the long tail at the other. The two remaining corners are made by the very large side fins. The many slender bones spreading out like rays from the shoulder to the edge of this fin gives them their first name, but why they are called "skates" I cannot tell.

We print this week the first installments of two lists which will, we are sure, be regarded as of great importance by all our readers who are interested in Natural History.

The *Fauna of Michigan* is from the pen of our valued correspondent "Archer," whose graceful sketches are so well known to the readers of FOREST AND STREAM. An old resident of the State of whose zoological features he writes, and a careful and thoroughly accurate observer, his notes on the animal life of Michigan cannot fail to be of the highest interest to all. In this list the nomenclature of no recent work has been followed, but we prefer to print it just as received, leaving to our readers to make any alterations or amendments which they may deem needful.

The *Birds of the Coteau des Prairies*, by Dr. McChesney, is a most interesting contribution to our ornithological knowledge, and the dates of the arrival and departure of the various species are especially valuable.

What a debt do not zoologists owe to the officers of our army, whose duties constantly lead them into the wildest and most unknown regions of our territory? From the date of Lewis and Clarke's expedition to the present time, the explorations and observations of the army, and especially of its medical men, have contributed more than any other one thing to increase our knowledge of the fauna and flora of the country west of the Mississippi. The debt which we owe to the army on this score is a large one, and it is constantly on the increase. The careful and thorough education which most officers have received, especially fits them for making observations of importance to science, and by far the larger portion of the work done by them is good work, and is of the greatest value.

BIRDS OF THE COTEAU DES PRAIRIES OF EASTERN DAKOTA.

BY CHARLES E. M'CHESNEY, M. D., U. S. A.

THE Coteau des Prairies of Dakota extend from about latitude 46 deg. North, longitude 20 deg. 20 min. West, some hundred and fifty or two hundred miles to the south-east, and have a variable width of from twenty to fifty miles. It is to the northern portion of this interesting region (in the vicinity of Fort Sisseton, late Fort Wadsworth) that the following notes have reference.

This region consists of high-rolling prairie, in the hollows of which are many lakes, and to these thousands of the waders and wild-fowl of all kinds annually resort. The region is very sparsely timbered, and is therefore poorly represented in land birds:

Turdus migratorius. Robin. This bird appears about April 24th, in small numbers, but the locality does not seem to be well suited to its summer residence. Migrates in a few days, to return in larger numbers about September 28th, and finally disappears for the season, October 28th, on the approach of winter.

Mimus carolinensis. Catbird. Appears about the 1st of June and remains until September 28th in small numbers; breeds here.

Harporhynchus rufus. Brown thrush. Appears April 30th and remains until the end of September in limited numbers: breeds here.

Sialia sialis. Eastern bluebird. Appears early in October and remains for a few days; is seen in small numbers.

Parus atricapillus. Black-capped chickadee. Is seen from September 28th until November 14th, in large numbers.

Eremophila alpestris. Horned lark. Appears September 28th and remains until November 15th, when it leaves this vicinity; returns about the middle of March, and is then found in large numbers in company with the snowbird (*Junco hyemalis*), and seems to take its departure about the same time, April 17th.

Dendræca æstiva. Summer yellowbird. This bird arrives May 17th and remains until September 17th. Is found in large numbers; breeds here.

Hirundo horreorum. Barn swallow. Is found in small numbers from May 25th until September 19th; breeds here.

Petrochelidon lunifrons. Cliff swallow. Appears May 4th and takes its departure about August 9th. Very abundant; breeds here.

Cotyle riparia. Bank swallow. Appears May 18th in considerable numbers; breeds here and disappears July 20th.

Progne purpurea. Purple martin. Arrives June 7th in small numbers and remains until September 9th; breeds here.

Plectrophanes lapponicus. Lapland longspur. Appears April 10th to remain until May 25th; is moderately abundant.

Plectrophanes pictus. Painted lark bunting. Is found from April 20th to May 25th, in large flocks (from twenty-five to one hundred).

Plectrophanes ornatus. Chestnut-collared bunting. Is found here during the same time as the last species, and in large numbers.

Passerculus savanna. Savanna sparrow. Is seen from June 10th until June 17th, probably passing North. Not abundant.

Poœcetes gramineus Var. *confinis.* Western grass finch. Arrives about April 17th and remains until October 18th. Is one of the most numerous of our birds, and is found all over the prairie; breeds here.

Melospiza melodia. Song-sparrow. Is seen for four or five days from June 10th in small numbers.

Junco hyemalis. Snowbird. Is a regular winter resident; arrives about November 14th and disappears about April 10th, with stragglers seen until May 8th; is quite numerous.

Spizella monticola. Tree sparrow. Appears April 10th and remains until the end of October; very numerous, and breeds here.

Calamospiza bicolor. White-winged blackbird. Appears on the prairie about July 14th in large flocks and remains until July 24th.

Euspiza americana. Black-throated bunting. Is found here from June 9th to July 26th in considerable numbers.

[To be Continued].

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN FOR WEEK ENDING APRIL 17TH.—Two Rousette Bats (*Pteropus oneitus*), purchased; two Horned Toads (*Phrynosoma cornutal*), presented; two young Panthers (*Felis concolor*), purchased; one small Alligator (*Alligator, mississippiensis*) presented. ARTHUR E. BROWN, General Supt.

ANIMALS RECEIVED AT CENTRAL PARK MENAGERIE FOR WEEK ENDING APRIL 21ST.—Two California quail (*Oreyx californianus*), presented by Mr. S. Davis, New York city; one Axis deer (*Axis maculata*), born in the menagerie; one striped hyœna (*Hyœna striata*); two adjutants (*Leptoptilus crumeniferus*). W. A. CONKLIN, Director.

FAUNA OF MICHIGAN.

BY ARCHER.

CLASS MAMMALIA—ORDER CHEIROPTERA—FAMILY VESPERTILIONIDÆ.

Vespertilio Noveboracensis. Linn. New York bat. *V. fuscus P. de B.* Black bat. *V. subulatus.* Say. Brown bat. *V. pluiops.* Temm. *V. Caroli.* Tomm.

ORDER RAPACIA—SUB-ORDER INSECTIVORA—FAMILY SORICIDÆ.

Blarina talpoides. Gray. Mole shrew. *Sorex talpoides.* Rich. Northern shrew; is confined to a few districts of the Upper Peninsula, but even there is rare. *Blarina angusticeps.* Bd. Short-tailed shrew.

FAMILY TALPIDÆ.

Scalops aquaticus. Cuv. Common mole. *S. argentatus,* Aud. & Ed. Bach. Silvery mole. *Condylura cristata.* Desm. Star-nosed mole. Is rarely seen within the limits of the State, I believe; having seen but one specimen, and heard of but two more.

SUB-ORDER CARNIVORA—FAMILY URSIDÆ.

Ursus Americanus. Pallas. Black bear. *Procyon lotor.* Storr. Raccoon.

FAMILY FELIDÆ.

Lynx Canadensis. Geoff. Canada lynx—*Loup Cervier. L. rufus.* Guld. Bay lynx. Wild cat. *Felis concolar.* Linn. Cougar. Panther.

FAMILY CANIDÆ.

Canis Occidentalis Var. *griseo albus.* Rich. Gray wolf; also known as *C. variabilis.* Max. *Canis latrans.* Say. Prairie wolf. Is now supposed to be extinct in Michigan.

SUB-FAMILY VULPINÆ.

Vulpes fulvus. Desm. Red fox. *V. decussatus.* Groff. Cross fox. *V. Virginianus.* De Kay, *Urocyon V.* Baird. Gray fox. *V. argentatus.* Bd. Silver fox.

FAMILY MUSTELIDÆ.—SUB-FAMILY LUTRINÆ.

Lutra Canadensis. Sab. Otter.

SUB-FAMILY MELINÆ.

Mephitis mephitica. Baird. Skunk. *Meles Labradoria.* Cuv. *Taxidea Americana,* Bd. Badger.

SUB-FAMILY MARTINÆ.

Mustela Canadensis Schrebu, M. Penantii. Erxl. Fisher. *M. Americana.* Turton. Pine marten. Both these are rare; an occasional skin, however, finds its way to market. *Putorius pusillus.* Aud. & Bach. *P. cicognanii.* Bd. Brown weasel. *Noveboracensis.* De Kay. White weasel; is but a variety of the former. *Putorius vison.* Rich. Brown mink. *P. nigrescens.* Aud. & Bach. Black mink. Variety of former. *Gulo Luscos Linn.* Wolverine. Glutton. The last known in the Lower Peninsula was killed near the mouth of Elk Creek, Sanitcoe County, October 17th, 1873, by "Archer."

ORDER MARSUPIATA—FAMILY DIDELPHIDÆ.

Didelphys Virginiana. Shaw. Opossum. Is confined to the southern tiers of counties, although occasional specimens have been captured in the centre of the State.

DOMESTICATION OF THE CANADA GOOSE.

BENSON GROVE, Iowa, March 14, 1877.

EDITOR FOREST AND STREAM.

There seem to be but few who have ever reported their experience in the domestication of the wild, or Canada goose (*Bernicla canadensis*), in the columns of your valuable paper, which I receive through the kindness of a friend. Having had some experience in this line, I wish to present it to your readers, hoping that they may be thus further enlightened as to domestication of this species.

In the year 1866 I found a wild goose nest shortly after incubation had commenced, and allowed the eggs to remain in the nest for two weeks, after which I transferred them to the nest of a setting hen, where after one week they were brought out, the young exhibiting no sign of discontent in following their foster parent. After they were two weeks old I clipped the first joint of one wing on each gosling, and then gave them the barnyard, which contains several acres, to roam in, and besides this they were occasionally turned out of the yard. They soon became as tame as kittens, and grew to be good-sized fowls. But, alas! in the fall they thought is prudent to change their abode, and having found the river, which was about sixty rods from the yard, set sail for a more congenial clime, thus ending my first experience.

My next was three years later, when I determined to make another effort. I found a nest containing nine eggs, which were brought out in the same way as the first. These were given their full freedom and free access to the door-yard, where I had a large trough of water fixed for them. They became very tame, and when fledged were permitted to fly around. They exhibited no signs of discontent, but on the other hand seemed to be perfectly satisfied with their home, going to the river and returning at pleasure.

There are two methods used in determining the sex of the wild goose. First, by the female being smaller. Second, by the voice of the female; it is not so harsh and coarse as that of the male. I now had a desire to know how long it would take them to mature, and after four years' patient waiting my curiosity was gratified by one of them making a nest on the top of an old, dilapidated shed, which was covered with straw, and which was elevated about ten feet above the ground, where she laid five eggs, but did not bring out any young. The cause, as I have since learned, was, that the eggs were kept too dry, necessarily requiring moisture to insure their successful incubation. The next year I threw up a pile of compost in the shape of a muskrat house, on which the goose built a nest, and this time she brought out five goslings, which were reared. I have another goose which did not breed until she was six years old. My geese make good decoys, often bringing the wild ones within a few rods of the house. Last spring one of the tame geese mated with a wild gander and brought him home, where, in a few days, he became quite tame, and in one week was as tame as any of the geese. The tame geese would creep through the fence; this he would never do, he would always fly over, but would pass through any narrow passage. H. H.

NEW YORK, March 20, 1877.

EDITOR FOREST AND STREAM.

I send the following note, thinking that it may be interesting to the fox-hunting readers of your valuable paper:

Silc, Oat and Theodore Morrell, all old fox hunters of Mianus, Conn., started on a fox-hunt last week. Two miles north of Mianus, at what is known as the Pine Hills, they started a fox, and so close were the dogs on him that he climbed a large pine tree, and when the Morrells came up they found the dogs barking at the foot of the tree. On looking up they spied the fox lying close to a limb some thirty feet from the ground. Silc pulled up and let him have it, and down he came, a handsome specimen of a silver and red fox; he weighed twelve pounds. It is very seldom that a silver-cross fox is killed in that neighborhood. Three years ago Capt. Oat Morrell's dog Rat caught a silver and red fox at "York Meadow," a mile north from the place where this one was killed.

Yours truly. F. G.

[We presume that the animal in question was a gray fox (*Urocyon virginianus*), a Southern species not nearly so fleet as our common red fox, and which not unfrequently climbs a tree when hard pressed by the dogs.—ED].

DO MINK CLIMB TREES?

PAMEDUNCOOK LAKE, March 27, 1877.

EDITOR FOREST AND STREAM.

While fishing upon Debsceneak Lake a few days ago, I saw what looked like a sable run along the shore. Starting on the run, I chased it a short distance, and when nearing it, it ran up a cedar tree about twenty feet high. To my surprise, it was a mink. Shouting to my companion, who was fishing a short distance from me, to bring me a rifle that we had with us, I soon dispatched his "highness," putting a bullet through, from ear to ear. Now is this an uncommon occurrence, or do mink climb trees? CHAS. E. WOODS.

THE SALT-WATER PIKE?—Some time since, as will be seen by the date of writing, we received the following interesting letter of inquiry. The fish in question being unknown to us, and the subject involving the question whether there was really a species of the *Esox* family inhabiting salt water, we have made extensive researches, not only of scientific works, but among intelligent persons in Virginia, whom we thought might be well informed. We regret to say that we have met with indifferent success. In the hope of eliciting more positive information we will no longer defer the publication of the letter. We trust our readers will give the subject their attention :

BALTIMORE, March 11, 1877.

EDITOR FOREST AND STREAM.

I am anxious to know if the common pike of the Chesapeake Bay and its salt water tributaries is identical with the pickerel of the northern lakes. To the uneducated, the two resemble each other. Will the pike common to our salt waters rise to the fly? I have frequently noticed them slowly swimming in the grass near shore, in water from one to three feet in depth, and quite near the surface. They are often speared, and sometimes killed with shot-guns; are exceeding shy, and very sudden and rapid in their movements. I have never seen one caught with hook by means of such bait as is used in our salt waters, namely, soft crab or small fish. They are very plentiful in our waters and are certainly very game, and will afford good sport if they will take the fly. Our waters now abound in white perch. Do they take the fly? Any affirmative information on this subject would be highly appreciated by your many readers in Maryland. Very respectfully,

GEO. P. BEALE, JR., Attorney at Law.
Mechanics' Bank Building, Baltimore.

The writer, it will be perceived, speaks of this fish as being "very plentiful," and "common in the Chesakeake Bay and its salt water tributaries;" it is "often speared, and sometimes killed with shot-guns." There can be no doubt, therefore, that such a fish exist, though it does not seem to have attracted the attention of ichthyologists. It is not mentioned in any work that we have examined. All the additional information that we have been enabled to gather, is comprised in the following brief note :

NORFOLK, Va., March 24.

EDITOR FOREST AND STREAM.

The salt-water pike is a rare fish here; saw two or three fine specimens last summer that were caught at the fisheries off Lynnhaven, a few miles inside of the Cape. Have never heard of their being caught by line. Those I saw were bright, clear, solid fish, trim-built, were much more solid than the fresh-water fish, the color was nearly white, and the scales clear and bright (devoid of the slime in the river fish). Those I saw weighed about three and a half pounds. The salt-water cat-fish has the same difference as regards color, compactness, etc.

Yours truly, W. H SEABURY.

STAINED GEESE FEATHERS.—There was a yellowish tinge about the breast feathers of nearly all the five dozen of Canada geese which our friend C. Dubois Wagstaff shot at Atlanticville the other day, which, not having been observed before, led him to suppose that possibly he had discovered a new variety. The fact was, that the feathers were merely stained at the tips by iron or something else in the water where the birds have been feeding. We have often observed the same thing in mallards and sprigtails.

—English sparrows, which have been domesticated in New York, have been introduced into Nova Scotia, where their services are needed to exterminate the worms.

Woodland, Farm and Garden.

COMMON INSECTS OF APRIL.

THE injurious insects in the Northern States have hardly begun their devastations by this time, as the buds have not yet unfolded. In April, however, the gardener should scrape and wash thoroughly all his fruit trees, so as to rub off the eggs of the bark lice, which hatch out early in May. Many injurious caterpillars and insects of all kinds winter under loose pieces of bark, or under straw, etc., at the foot of trees. The eggs of the canker worm and tent caterpillar, which last are laid in bunches half an inch long on the ends of the twigs of our fruit trees, should also be searched after. Their destruction will effect a great saving. The apple-tree borer should be looked for at the base of the tree, and under dark places in the bark where the grub is at work, and its ravages arrested. Cylindrical bark borers, which include various species of little round black weevils, and weevil-like beetles, often causing the "fire-blight" in pears, etc., are now flying about fruit trees to lay their eggs; also certain boring beetles that infest the pines. This is the best time of the year to destroy these pests, and also the best time to seek varieties for the cabinet.

The housewife must now guard against the intrusion of clothes moths, for the warm days bring them into the houses, and in the orchard myriads of these and other insects are flying about among the opening buds, fulfilling their own plans very well, no doubt, but working mischief to the agriculturist. The common clothes moth or *Tinea* is of a light, lustrous buff color, the hind wings and abdomen being a little paler. The head is thickly tufted with hairs, and is somewhat tawny in color. The moth begins to fly about our apartments in May, laying its eggs in woolen and sometimes in soft cotton goods. Early in June the flattened, cylindrical cases of the pupæ may be found, but not easily, for they are concealed by the circumstance that the caterpillars become of the color of the objects they feed upon, and are thus not readily discerned. The body of the chrysalis is curved, with the head smooth and rounded, and spims along the back. When about to transform, the skin splits open on the back and is rapidly moulted. Of all the preventives used, none are more efficacious than benzine or a weak solution of carbolic acid, but each of these leaves a disagreeable odor. All furs and woolens should be closely examined early in June. The carpet moth, another *Tinea*, is blackish at the base of the fore-wings, the remainder being yellowish-white, while the hind wings are dark gray and the head white. Another obnoxious *Tinea* is the grain moth, which is found flying in granaries in summer. The female lays thirty or more minute eggs, one or two on each grain of wheat. The larva hatches in a few days, eats its way into the wheat, and after it has devoured the interior of one grain, unites others in succession to it, until it binds together a number of them. To prevent its attacks, whitewash your granaries, or wash with oil. A good way to kill the moths when numerous is to attract them to suicide in the flames of a bright light. The grain should also be shoveled over to disturb the larvæ at work, for here, as before, it is the young which do the mischief.

On the other hand, there begin to be seen beneficial as well as injurious insects in these early spring days. Such are the *carabus* beetles which prey on those insects largely hurtful to crops. They are dark colored, with metallic hues, and run in the grass or hide under stones, whence at night they sally forth to hunt for the vegetable eaters, that at that time are most active. The larvæ of some of these ascend trees to eat the caterpillars lodged in the branches, and some of these beetles dig pits, at the bottom of which they lie in wait for their victims, tearing to pieces with carnivorous ferocity those bugs unfortunate enough to fall into their grasp.

It is now that the ants awake from their sleep, and throw up their hillocks in our garden paths, while the "thriving pismires" issue from their vaulted galleries, and swarm over the decaying logs and stumps which have furnished them shelter during the winter.

THE VERBENA DISEASE.

FOR a number of years past it has been a question of anxious inquiry among growers of the verbena as to the cause of the disease to which it has been subjected, and instead of any abatement, there seems still a growing interest in the subject, which may be taken as a sign that at no distant day it shall be finally and satisfactorily settled. But whether on the side of those who have espoused the insect theory, or those who believe it the work of a fungus, yet remains to be seen. On this, as on all similar subjects, predilections should have no place, but rather a patient looking at the facts as they present themselves over the whole field, so that in the end a complete diagnosis might be written, from which to glean measures of prevention, or at least some method by which to mitigate the evil. From the obscurity of the subject, and a want of means to carry on exhaustive research, some of the views which have been taken seem to rest upon no solid foundation. Of those views only two are worthy of consideration, and somehow neither the one nor the other has yet been stated in such a way as to be entirely satisfactory.

Those who have supported the insect theory do not seem agreed as to the particular species which does the mischief. Some believe it is the larva of that fly (callipteris) which frequents verbena beds in the fall to deposit its eggs. But there must be a mistake here, as the larva of that insect seems the one which burrows in the cuttings and young plants through the early part of winter, and is one or more

lines long. More credence is to be placed in those who regard the desperado as a mite, but they are equally mistaken in saying it can conceal itself at pleasure under the skin of the leaves or other soft parts of the plants; for we have watched their movements under a glass when surrounded with tobacco smoke, to which dislike is sometimes shown by wonderful contortions of body and limbs, which may be regarded as the outward and visible signs of tobacco sickness; but never yet have we seen them show the least disposition or ability to burrow in the leaves for safety. Yet from the fact that tobacco smoke is distasteful to them, it might be inferred that by strong and oft-repeated doses, they might by that means be got rid of, or at least greatly held in check.

In the absence of positive proof there is some show of reason for believing this mite capable of producing the disease in question; for, if a mite, the presumption is it belongs to acaridæ—a class of insects, however, low in the scale of being which yet produces great and important results in nature. Some are familiar to us, as they are to be found in old cheese, preserved fruits, sugar and flour. Some live upon juices of plants; others are parasites, and minute species have even been found in the follicels of the human skin, the brain and the eyes. The harvest bug is another, the bite of which gives much annoyance; and the itch insect, which breeds festering sores; and hay fever is caused by yet another, which sends its victims to the uplands in harvest time in quest of relief from their sufferings. This, and more than all this, goes to show it would be no great marvel if this mite were yet to be identified as the true and only cause of the disease. But then there are facts which militate against such a conclusion, and which seem perfectly insurmountable, that is, that they are to be found on diseased plants, and also on others not diseased, while in some instances they are not present on some of the worst cases. All of which points to the conclusion that at the most they accompany the disease more as a consequence than as the cause thereof.

In thus dismissing the insect theory as untenable, we are by no means assured of being able to present any other entirely satisfactory. That, however, which regards it as the work of a parasitical fungus seems more in accordance with appearances, and in this direction we are introduced to a set of agents whose power to destroy living organisms is unquestioned—agents protean in form, subtle and insidious in their attacks. So true is this that under different circumstances they assume appearances so very dissimilar as to have deceived the greatest mycologists, and led them to classify and name differently some which are identical as regards specific characters. In illustration of this we need only refer to the species now known as the cause of potato rust, it having been named fusisporium solana, oidium violacium, and peronospora devastatrix—all of which have been found by recent investigations to be only different forms of the same fungus. And if, as has been lately stated in another periodical, the verbena disease is caused by erysiphe verbinæ, we may conclude it to be either a new and distinct species, or one not new, under some other name—only changed by difference of food or other circumstance. This view is countenanced in Loudon's Encyclopædia of Plants, where it is stated—"Most of the productions arranged under the head erysiphe are known as mildew. They are better characterized by the plants on which they grow than by their peculiar differences, which, it is probable, depends very much upon the former circumstance." But appearances do not favor the belief that it is an erysiphe at all; at least we are not aware of it having yet been seen on the verbena in the mildew state, which is the highest stage of development. The visible effects look more like the work of a fungus, which seldom shows itself on the outside of the leaves, and only indicates its presence by the curled and rusty appearance of those organs. This seems also in perfect accord with views held by some modern mycologists, who recognize several stages of development in fungus growth, in the first stages of which a given species might remain indefinitely before passing into the highest or mildew state. And in the first micrococus or single-cell stage, at which the boundary of vegetable life is reached, the organisms have the power of most rapid increase by cell division, and from the extreme minuteness of these bodies, they can, if either in the atmosphere or in the soil, readily enter the vegetable system, there to increase rapidly or otherwise, as circumstances determine.

Now, without laying claim to any clear perception of this perplexing question, we advance the opinion that the disease is caused by fungus growth somewhat in the way as herein indicated, and if ever developed on the verbena beyond the micrococus or cryptoccus states, greater magnifying power must be called into requisition to detect it than I have yet been able to command—unless the spheroidal bodies which surmount the hairs, and the rusty specks which dot the cuticle of diseased plants, may be regarded in this light. But in the absence of positive proof that this is the case, there is much to warrant the belief that the mischief is due to such an agent entering the cellular tissues of the plant, in disrupting the cell walls and living upon their contents, and at the same time polluting the very fountain and streams of life.

—In St. Augustine, Florida, they have a large laboratory for the manufacture of wine made from bitter oranges.

—The entrails of sheep are being utilized in California, where they are manufactured into ropes for hoisting apparatus in mines, etc.

—Michael Angelo, the sublimest name in art, was wont to say that the bath was the cradle which fostered his grandest conceptions. Of course he knew nothing about that *chef d'œuvre*, B. T. Babbitt's Toilet Soap, or else he would have had a word or two to say about this indispensable adjunct.—*Adv.*

THE HERB GARDEN.

"SEED time cometh" says an advertisement in last number, and it means hard work and plenty of it in the garden, for how much is there not to be done in the first month of spring? Winter with his icy hand prevents any work being accomplished till gentle spring unlocks his fingers and bids the snowdrop and the crocus tell us that his reign is o'er, and that soon our gardens and woods will be gladdened by the early flowers and sweet songsters. We are apt in the hurry of planting and sowing to forget all about the growth of sweet or pot herbs till too late to be of much service, and even if a few are planted or sown, they are generally placed in out-of-the-way corners, and time and patience are exhausted in looking them up when required. Quite a useful feature might be made in every garden, however small, of the herbs, if they were only brought together and arranged in order. Probably the best disposition for their culture is in beds from two to four feet wide, with paths between. Of course in small gardens one entire bed will not be needed for any herb, but several kinds can be grown together, such as common and lemon thyme, pennyroyal, and marjoram in one; fennel, sage, and tarragon in another, and so on. Mint should have a bed for itself, as mint-sauce is always in demand; chervil, again, is much wanted by some for salads, dill for flavoring pickles, horehound for sore throats, tansy for tea (not that anybody ever drinks it); chamomile for face ache and stomach ailments; rue for the gapes in poultry, and many other curious herbs that the cultivator may fancy. A bed should be reserved for angelica, as also for borage, an excellent bee plant, as well as for flavoring claret sangaree in hot weather. Again, the herb garden is just the place for the orderly and systematic cultivation of all small salading, such as mustard and cress; a constant succession of young onions, a bed or edging of chives, and the growth of radishes, lettuces, endive, etc., throughout the season. Finally, several beds should be set aside for the cultivation of parsley—a plant sadly neglected in small gardens. Let it have rich, deep soil, use only a good curled sort. Sow thinly, and thin out to a foot apart, and the vigor, strength, and beauty of result will astonish those who have to make small, often dirty leaves do duty instead for flavoring or garnishing. If the garden is too small to devote one or more beds to parsley, the whole herb garden might be fringed round with it, and the plants themselves be garnished with its beauty. No portion of any garden, large or small, not even excluding that wholly devoted to flowers, will afford more pleasure or be of more service than a herb garden, well furnished and kept.

THE FRUIT TRADE.—We find in a recent issue of *The Grocer* some very interesting statistics regarding the fruit trade of this port. We derive our supplies from the British East and West Indies, France, and the French West Indies, Austria, Italy, Spain, Cuba, Porto Rico, Central America, Brazil, Hayti, Mexico, San Domingo, Columbia, and Venezuela. The Mediterranean trade shows a slight increase for 1876 over the previous year, while statistics of the West Indies trade shows a large decrease both in amount and value. Perhaps the increased attention paid to fruit culture in the South may have something to do with this. The value of the green fruit entered for consumption at the port of New York, from January 1, 1876, to December 31, 1876, is as follows:

Variety of fruit.	Per cent. duty.	Value.	Amt. of duty.
Lemons	20	$1,202,514	$240,502.80
Oranges	20	998,860	199,772.00
Grapes	20	126,053	25,210.60
Pineapples	20	141,967	28,393.40
Bananas	10	403,733	40,373.30
Limes, Plantains, Grape Fruit, Mangoes, Shaddock, Melons	10	2,364	236.10
Cocoanuts	Free.	186,112	.....
Total		$3,061,603	$554,488.20

A comparison of the value of green fruit imported in 1876 with that of 1875 shows a decrease in value of $394,158, and of duty, $85,583.80.

NOTES ON ORANGE CULTURE.

MANDARIN, Florida, April 14. 1877.

I SUPPOSE that one-half the young orange trees set out in Florida never live to fulfill the expectations of their owners. It seems indispensable to success, in raising a grove, that there should be some one to care for the trees from the start, watering them frequently when transplanted, and if they are on high land, refreshing them in this way during the dry season for a year or two, until the top root has time to go deep in the ground and supply the tree itself. Then the weeds and grass are to be kept down; insects and disease to be guarded against, and there is no spare time; every day can be profitably employed, and the perceptible improvement in the grove will repay the care.

Under such circumstances not more than five per cent. of the young trees should be lost. If you are fortunate you will save all, but it will indeed be good fortune, for the trees being more or less mutilated in digging up, and often transported long distances, to lose a few seems almost inevitable. It is best, when possible, to obtain the trees from some nursery near at hand. Take them up, dirt and all, and set them out, and if this is done with care early in the Florida spring, say in February, and the watering attended to, the tree will never know it has been moved.

The great loss among young orange trees is with those who come to Florida to speculate in a loose way in the enterprise. They buy land, order trees here and there, employ rude hands to set them out and then go North, when the weather grows warm, leaving their grove to take care of itself, or, what amounts to the same thing, hiring some incapable person to look after it, while they mentally figure up prospective profits which they will never get.

Let me cite an instance of this kind; The man employed to look after the grove was a carpenter in the habit of jobbing out. I will suppose he meant to do right by his employer, but he couldn't let hammer and nails alone, and sawing was his second nature. He attended to the trees after a fashion, but it turned out to be a poor fashion, and they all died. There was regret on his side and indignation on his employer's. Under the conditions thus described, hundreds of young orange trees annually die, and the money paid for them and for the labor of transplanting is as good as thrown away. Look at it for a moment. The soil in this State is light, porous and sandy—not like the heavy land North. It takes but a little hot weather to rob it of its moisture, and a long drouth will turn it into a second Sahara. Fortunately long drouths are of rare occurrence; but what is a young, tender, transplanted tree going to do even for a few days, in soil not to the depth of your hand or more. Its roots are torn, it has borne transportation, and no longer shaded by its nursery companions it stands in the dry sand in its appointed place with more room than it wants, for all it wants is room to die.

Setting out orange trees is generally done in February, when the new growth begins to put forth, the weather being moderately warm, with now and then a cool spell. It is the busy month of the year for this work whose hurry and rush are all over by the middle of March. Now and then you meet a man who takes the summer or any part of the year for this task, but he is an exception, and his ways undoubtedly more risky than other people's, notwithstanding he has always a flourishing tree handy to point to as an example of his remarkable course. C. D. D.

SPRING.

WARNER, N. H., April 16, 1877.

EDITOR FOREST AND STREAM.

I often think of the geniality of a warmer clime, when reading in your paper about the early migration of birds in places further South, "and long to be there." I do not grudge the pleasure of those more favored, but would gladly share it with all if I could.

Here, the first blue bird I saw was on March 21st; robins a few days later; then song sparrows; and from the first to the 8th of April, blackbirds, rusty grackle, cow birds, grass finches, chipping sparrows; and then a few hermit thrushes, pheobe birds, and I think I heard the chatter of a kingfisher; and hope soon to hear the merry carol of many a beautiful warbler, one of the loves (for they have many) of every true naturalist.

The spring is earlier than usual with us, yet our returned friends must find some cold nights, as the snow banks lie thick and heavy in many a shady nook; but they are going, and more than in many cases, we love to say good by. Frogs have been heard about a week. Taking all these signs together, we think spring has arrived.

Welcome sweet Spring,
Thou herald of pleasure,
Who bringest the sweet breezes
Without stint or measure;
Fold us in thy love arms,
A wealth of gold;
And lure us still onward
To joys untold.

M. C. H.

TOMATOES, WASPS, ETC.—Some say that tomatoes prevent wasps from entering fruit-houses, and a correspondent of *Moore's Rural* says: "Set a tomato plant into each hill of cucumbers, melons and squashes, and you will have no trouble from the striped bugs that are so destructive to these plants. The plants can be tied to stakes, and if well pruned when large, both subjects can proceed with their fruiting without detriment to one another."

DIFFERENT DEGREES OF FRAGRANCE IN HYACINTHS.—Until this winter I was under the impression that all hyacinths were equally sweet-scented. My attention being drawn to the subject, I find the greatest difference among all the colors; and as we only grow them for their perfume, and never trouble with the names, I would be very glad if any of your correspondents who have noticed this peculiarity in hyacinths would give me a dozen names of each of the three colors—red, white and blue—among sweet-scented singles. For those who are overpowered by the smell of hyacinths, it may be an advantage to know the names of those kinds that are devoid of the true hyacinth perfume. In a pot of three reds before me, whilst two pinks are scentless, the perfume of a third, a rose-colored kind, is delicious, the spikes of all being in perfection. F. J.

FEES GIVEN TO JOCKEYS.—The fees earned by a successful jockey, speaking roundly, form the least portion of his income, as the presents given him by owners of horses and numerous "admirers," in the shape of betters, who have backed his mounts, are frequent and valuable. Gold watches, diamond rings, and breast-pins set with rubies; riding horses, dog-carts, and yachts; as well as suits of clothes, new hats, boxes of cigars, and cases of champagne, are frequently bestowed on jockeys who win important races. A noted professional horseman of ten years ago received in two seasons as many boxes of cigars as would have stocked a modest shop. The same lad was also presented in the course of his career—which, although of short duration, was exceedingly successful—with eleven gold watches (he always used a silver one) and seven finger-rings set with diamonds, as well as with other valuable jewels. Money gifts to successful jockeys are now, however, the order of the day, and that such gifts are often of great magnitude there is abundant evidence to show. It is well-known, for instance, in turf circles that the jockey who rode Rosebery (the chief jockey), the winner of the last Cesarewitch at Newmarket, was presented by the owner of the horse with a check for £1,000; a similar sum being given to the jockey who rode the winner of the Cambridgeshire, which race was also won by Rosebery. Such sums, large as they undoubtedly are, extravagant as they may indeed appear in the eyes of non-racing people, have been more than once bestowed for work well done on the race-course. So far back as the year 1824 Benjamin Smith was presented with a testimonial of nearly one thousand pounds, subscribed for by a number of persons, on the occasion of his admirable riding of Jerry in the great St. Leger stakes at Doncaster. Ten years ago the jockey who rode the winner of the sensational Derby of that period was presented by the owner of Hermit, the winning horse, with a sum of £3,000. Another gentleman gave him what in racing parlance is called a "monkey," which is £500; while a present of £100 was bestowed by a third person. Numerous offerings of lesser value, as also some gifts of jewelry, were likewise sent to the hero of the race, who is said to have netted over £4,000 by his exertions on that one occasion, which is about double the sum paid to Sir Walter Scott for writing his celebrated poem of the "Lady of the Lake."—*Temple Bar.*

Yachting and Boating.

BROOKLYN YACHT CLUB.—At the last regular monthly meeting of this Club, the quarterly report of the Treasurer showed receipts of the total amount of $1,372.21; expenditures, $794.67; balance on hand, $577.54. The Trustees, through their Chairman, ex-Commodore Dillon, submitted a report recommending that the Club-house at Gravesend Bay be either leased or disposed of, as it was unsuitably situated and expensive. The matter was referred to the Trustees with power. The Committee recommended that each member of the Club be supplied with one ticket, admitting a gentleman and two ladies to the steamer which is to accompany the yachts on the June regatta, and that a limited number of tickets be sold at $2 each for the admission of a gentleman and lady, and $1 for a lady only, which was adopted. No Club book will be published this year. The Regatta Committee recommended a change of the regatta course in order to accommodate craft of larger tonnage than the present yachts of the Club.

THE COUNTESS OF DUFFERIN.—It seems as though the troubles of this unfortunate yacht would never cease. Now comes Captain Cuthbert, her former sailing master, and attaches her for wages due him. She now has a marshal on board, and if she is sold under the attachment it is said to be the Captain's intention to buy her in, alter her stem, cut down her overhang, and make such general alterations as will, he thinks, materially increase her speed. Then he will challenge again this summer for the Queen's cup. The Canadian stockholders, for the Countess is a stock concern, must be tired of their venture.

BOAT RACE AT BOSTON.—A well contested and exciting boat race came off at Boston on the 17th inst., from the end of Commercial wharf. It was between the six crews of the Lakeman Club, and the distance rowed was from the wharf, around the buoy (half way down to Fort Independence) and back, a distance of three miles, the whole trip. The water was by no means smooth. The boats started a little before 7 o'clock, and after a hard pull the boat of which R. J. Kelley was stroke came in first; time, 17 minutes. The next boat, Peter O'Neil, stroke, was nearly even with it, and the third a boat's length behind. The fourth boat, M. Ryder, the fifth, A. Howes, and the sixth, N. Henry, were only about a boat's length apart. A great crowd of people witnessed the race.

—The sales in the retail warerooms of Baldwin the clothier, Broadway and Canal street, have amounted to over seventeen thousand four hundred dollars in one day, *all cash*. The Brooklyn branch house has done correspondingly well. It should be remembered that Baldwin sells only men's and boys' clothing, and all C. O. D.—*Exchange.*

New Publications.

HOW TO RAISE FRUITS. A handbook of fruit culture. By Thos. Gregg. 12mo., fully illustrated. Price, $1. New York: S. R. Wells & Co.

We have carefully looked over this neat hand-book, comparing many of the descriptions with Downing's "Fruits and Fruit Trees," and find it an excellent digest of the experience and practical remarks of our principal pomologists. The introductory remarks are clear and pointed, the author plainly showing that the free use of fruit as an article of food is not only economical and healthful, but also a profitable occupation to the grower. The first part is taken up with "Fruit Culture in general," with good, practical directions for preparation of the soil, planting and after management, while the latter part is devoted to a description of those kinds of fruits which have obtained a permanent reputation, and which are best adapted to the climate and soil of the Middle and Western States. While this hand-book will meet the requirements of many who wish to know the fruits best suited for their particular locality, without having to invest in more elaborate books, or wade through a host of names in nurserymen's catalogues, which to them have little or no meaning, it is also full of valuable hints and suggestions to the practical fruit grower. Downing, Barry, Thomas, and others are liberally quoted, the author being always careful to give his authority for his statements. We can well indorse the closing words of the brief prospectus sent us: "Its price considered, we know not the volume which contains a greater amount of useful information on fruits and their culture, and which is more tastefully gotten up."

HOW TO TEACH ACCORDING TO TEMPERAMENT AND MENTAL DEVELOPMENT; or, Phrenology in the School-room and the Family. By Nelson Sizer, author of "Choice of Pursuits," etc. 12mo, cloth, pp. 331. Price $1.50. New York: S. R. Wells & Co.

Appreciative of the fact that a proper classification lies at the basis of true success in teaching, and that there cannot be this classification without a correct analysis of the mental faculties, the author of this new work has entered fully into the consideration of the mental organism of children, and discusses it apart from, and in association with, physical qualities or temperament. He shows how children differ in educational susceptibility, and why, and prescribes methods for the training of different classes of minds. This is an entirely new feature in a book intended for the use of teachers, and its thoughtful consideration must prove of great advantage to them. The text is written in a manner which must attract every reader, and its numerous and apt illustrations assist the text greatly in pressing home the points advanced in such a manner as to be thoroughly intelligible to every class of readers.

We take it that no teacher who loves his vocation, and aims to secure the best results, will neglect an opportunity to read this last well-written and well-printed contribution to the cause of education.

DOMESTICATED TROUT. How to Breed and Grow Them. By Livingston Stone, U. S. Deputy Fish Commissioner. 1 Vol., 16mo. Illustrated. Tinted paper, bevelled boards, $2.50. J. R. Osgood & Co., Boston.

A reference to our advertising columns will show that Mr. Stone has issued a new and improved edition of his valuable work on breeding and growing trout. To the fish breeder who desires to go into the business of rearing fish with a view to profit, or the amateur or country gentleman who breeds for amusement, the book is alike of interest. Added to a large and increasing experience, Mr. Stone brings a real devotion to his favorite pursuit, a combination which enables him to present his subject in a manner which is at once entertaining and thoroughly practical. The value of Mr. Stone's work is now thoroughly appreciated by all fish breeders, and we can heartily recommend it to all who propose engaging in a similar undertaking.

THE LIFE OF GEN. CUSTER.—The caustic critics of the London *Saturday Review* have found something in American literature at last which they can praise without qualification. It is Whittaker's "Life of Gen. Custer," published by the Sheldons. The book is pronounced by them to be eminently lively and readable. The reviewer says: "Its descriptions of military movements are clear and graphic, and few of the multitude of military biographies to which the war has given rise can be read with so much pleasure."

FIRST AND TRUE LOVE. By George Sand. One volume, paper cover, copiously illustrated. Published and for sale by T. B. Peterson & Brothers, Philadelphia.

George Sand has an exuberant imagination, with a very chaste style of expression. "First and True Love" is one of her best efforts, and will no doubt obtain the popularity which her many other popular novels have done. Price 75 cents.

Appletons' Journal for May gives the second paper on the "Anatrian Arctic Expedition," the interest of which greatly exceeds that of the first paper. It is, indeed, one of the most entertaining and thrilling records of Arctic adventure that has appeared for a long time. The article is fully illustrated. Constance Fenimore Woolson has a story of early Virginia colonial life, that is strikingly original in its incidents and method. Another short story, by Matilda Joslyn Gage, entitled "The Walking-Fern," is of American village life; it has some good characterization and unhackneyed incidents. Julian Hawthorne, under the title of "The Great White Wall," describes, in his own characteristic and effective style, features of the English south coast. There is a paper by Mr. Eggleston on the peculiar religious sects in Russia, derived from Wallace's and Hepworth Dixon's recent books on that country. Mr. George M. Towle gleans some of the best points in Harriet Martineau's autobiography; Lucy Hooper explains the intricate laws of Parisian etiquette; and Mrs. Church discusses seasonably the making of country and city gardens. There are poems by Stoddard, John Moran, and Nora Perry, the one by the latter being accompanied by an admirable illustration from the pencil of Alfred Fredericks. The serial "Cherry Ripe!" deepens in dramatic interest. The editorial departments are as full as usual.

Baldwin's Monthly. This neat and admirably conducted periodical comes to us this month with its usually rich and varied freight. Mr. Baldwin is eminently judicious in his choice of a corps of contributors, and succeeds in investing the *Monthly* with an interest and variety unknown to many more pretentious publications. The subjects of which it treats are literature and literary men, art, music and general topics. It may be said, in fact, that in tone and judgment the *Monthly* is the literary illustration of the qualities which have made Mr. Baldwin, as a man of business, a success. He gives his readers the work of the best writers of the time, just as he gives his customers the best workmanship of the day.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

S. S. P.—What is the reputation of the A. Lancaster (London) gun? I understand it is equal to Pape, Dougal or Scott. Ans. First-class, and equal to those named.

A. B. B., New York.—Will Henry Fisher, who published an article on browning gun-barrels in our issue of November 2, 1876, send his address to A. B. B., care this office.

F. W. K., Milburn, N. J.—Where can I procure a copy of the report of the New Jersey Fish Commissioners? Ans. Address D. H. Anderson, Fish Commissioner, Trenton N. J.

TROUT, Greene, N. Y.—Is there good trout fishing in any part of Delaware County? if so, at what place? Which is the best for salmon-trout, spoon or live bait? What spoon is the best to use in trolling for salmon-trout? Ans. The trolling spoon in May and June and live or artificial minnow in midsummer and fall. McHarg, Buel and Chap man's spoons are all good.

FRIEND, Brattleboro.—Will you please give me an address of some person or firm that I can send to, to get a price list of artificial eyes for birds and animals. 2d. Is there any shooting of any kind of game in any season of the year in the vicinity of Bay City, Michigan? Ans. J. Wallace, 19 North William St., New York. Good fish and shooting easily reached from Bay City.

H. G. B., Ottawa.—Will you kindly inform me the charge of powder and shot (giving No. of shot) that Captain Bogardus now uses for ducks; also what kind of metallic shells he uses for field shooting? My gun is same as his, 10-bore, 10 pounds weight. Ans. We presume he uses about 3 drachms powder, and 1¼ ounce No. 4 shot. He uses Hart's shells.

W. T. R., New York.—Please inform me if you have examined into the merits of the Miller "recoil-check," for guns; and, if so, your opinion of it, and whether you would advise the attachment to fine guns that may have a rather unpleasant recoil? Ans. We have not examined it personally, but are informed by those who have that it answers the purpose admirably.

A. B., Lancaster.—A's dog serves B's bitch, the bargain is $10 and one pup, and if the bitch don't have pups, to be nothing. Now the bitch gives birth to ten puppies, all dead; they were one day ahead of time; ought B pay the $10 or not? Ans. According to all precedent, B should pay the $10. His bitch was in vicinity to A's dog; her missing might have been caused by his (B's) negligence.

E. D. H., Allentown.—Can you recommend any particular style of wading pants, boots or stockings, for general use in the rough mountain streams of Pennsylvania? Ans. We have found the most serviceable boot to be the ordinary thigh rubber boot. You can, however, procure Mackintosh wading stockings, covering the thigh, to be worn inside of army shoes perforated with holes, to permit the free ingress and egress of water, the shoes protecting the stockings from stones.

D. F. E., Strasburg, Va.—1st. Would you please let me know where the Plympton parlor skate, that you mention in your paper, can be obtained, and price? also if there is any work on parlor-skating teaching the figures, and where it can be found, with price? 2d. What is the name or author of the best latest work on croquet rules? Ans. 1st. We are informed that the Plympton skate cannot be purchased. There is an English work on skating, but we believe that no book can instruct in this art. 2d. Messrs. Peck & Snyder, of this city, have a work on croquet; price 25 cts.

T. J. D., Gilford.—I have a sick dog, he has a sore in his ears; it runs some and smells bad. His head is not sore but feels bad, and I think his ears itch, for he scratches them? Ans. Your dog has canker, and as you have allowed it to run for over a year it will be difficult to cure him. First, wash the ears thoroughly with Castile soap and warm water, and after thoroughly drying them, pour in enough to fill the ear of the following lotion twice a day: Goulard's extract and wine of opium, each one half ounce; sulphate of zinc, one half drachm; water, seven ounces, mix.

THADDEUS, Minnesota.—The cisco of Geneva Lake is not a *coregonus* (family of white-fish), although it was formerly considered such until Agassiz pointed out that it was different. It is a cisco, called by Jordan, *Argyrosomus clupeiformis sisco*. It is found, according to him, in lakes Nemahbin, Oconomowoc, La Belle, etc., of Wisconsin, and in Lake Tippecanoe, Indiana. It makes its appearance in Geneva Lake and takes the fly with avidity for ten days, when it disappears altogether. It affords very good sport.

C. J. S., Albany, N. Y.—Will you please inform me where I can obtain a good book that will post me on fly fishing, and the price, and oblige? Ans. There is no work devoted to the art of fly fishing. Scott's Fising in American Waters, Norris' American Angler's Book, Roosevelt's Game Fish of the North, Dawson's Pleasures of Angling, and Hallock's Fishing Tourist, all contain a good deal of general information on this subject.

PHENIX, Michigan.—I read in your paper of prepared white fish spawn, called "Caviare," I think. Can you tell me how it is prepared, and where there is a market for it? Ans. Cavaire is prepared from the roe of the sturgeon or other fish, by salting them in such a manner that they do not easily become fetid. It is used over the civilized world, but the principal manufactories, as well as consumption, are in Russia.

FRITZ, Louisville, Ky.—My pointer has had a bad at tack of distemper. His appetite is good, but he has a running at the eyes and is very weak; in walking, often staggers. Ans. The symptoms given are altogether too meagre to enable us to prescribe for your dog. If he is *recovering* from an attack of distemper, the best treatment you can follow is to give him a sufficiency of nourishing food and a tonic of, say five grains quinine and ten drops tincture of iron per day.

C. L. V., Millenville, N. Y.—Can you furnish me with a completed list of "Audubon's" works, either new or second-hand; also "Maynard's Naturalist's Guide," and "Coues' Field Ornithology?" If so, what will be your price? Ans. We cannot furnish the books asked for. The price of Audubon, which is very rare, is $100, and you will have to advertise for a copy. Field Ornithology ($2.50), and Maynard's Guide ($2), can be bought of Dodd, Mead & Co., 751 Broadway.

W. S., Rouse's Point.—1st. What is the matter with my spaniel? He is always scratching his ear and often I brush him, and when I brush his ear he seems to like it. He appears to be perfectly well other ways, 2d. What is good for lice or fleas? Ans. 1st. At what age would you begin to train a cocker? Ans. 1st. Your dog has canker. Dissolve 20 grains of sulphate of copper in eight ounces of water, and pour a little in the ear night and morning. 2d. The best thing we know of is Steadman's Flea Powder, which can be had of W. Holberton, 102 Nassau Street, this city. 3d. Six months.

G. S. B., Washington, D. C.—1. How can wild game be treated or preserved so as to stand the voyage to England? 2d. Can fire stock of a gun be lent from 1¾ inch drop to 2½ inch drop without injury to it? 3d. Will it hurt the hunting qualities of puppies to let them see and smell partridges that are confined in a room—the room is large and has brush, &c., in it? Ans. 1st. In very cold weather the birds will keep without any preparation, although it might be well to draw and stuff them with charcoal. At other seasons they would keep in refrigerators of the same kind as those now used for transporting meat. 2d. Yes. 3d. No.

W. L. S.—1st. I have an English gun stamped "Wilmot, London." Is the firm one of note, and can you recommend their make? 2d. Do you think that a stalking horse could be made and used to advantage with ducks? I have seen accounts of them in an English work. 3d. Do you think that deer are on the increase in the Adirondacks since the dog ordinance has been passed forbidding hounding? Ans. 1st. We do not know a maker of that name. 2d. It might; a mule or gentle horse accustomed to pasture in the neighborhood of where the ducks feed, answers very well. 3d. On the contrary, quite the reverse; more are killed on the snow than are spared by the hounds.

RIFLE OR SHOT-GUN, Harrisburg.—Will you please answer through your paper which you consider the most scientific shooting? Is it with rifle or shot-gun?—general shooting taken in consideration. We had an argument, and concluded to leave it with you. Ans. The two modes of shooting are so different, that while the same faculties of eye and nerve are required in both, it would be as difficult to discriminate between them as between sculpture and painting. If we consider the appliances used and the mathematical considerations necessary, we should say that rifle-shooting, as practiced for instance at Creedmoor, was the most scientific, in the strict application of the word.

T. W., Philadelphia.—1st. What will cure my setter dog of deafness? He is about one year old and not broken. He has been deaf for the last six months, ever since I have had him. Have you ever heard of setter dogs being born deaf? 2d. His color is dark-brown, spotted with white, bushy tail, small head; what kind of a setter is he from this description? Ans. 1st. We do not believe that your dog can be cured of deafness, certainly if the predisposing cause is not known. We never have heard of a dog being born deaf. 2d. It would be impossible to tell the breeding of your setter without seeing him, but from your description, we should say that he had colley blood in him.

T. F. M., New York.—What is the value of land in the southern part of Tennessee, say in the County of Franklin? How long is it before grants of land are outstanding when no taxes have been paid? I have deeds of land in that county on which no taxes have been paid for nearly nineteen years; is it any good? if so, where should I go to inquire about it? Ans. As to the actual value of land in the county named, we can give no positive answer; we apprehend, however, that much depends upon the locality and improvements. Matters have been, so to speak, mixed so since the war, that we fancy you would have no difficulty in reclaiming your land. We would suggest to you to write to the County Clerk of Franklin County, who can give all information.

PATRICK, Camp McDermit, Nev.—1st. I have a double-barrel breech-loading shot-gun in which I use "Draper's" brass shells; after firing six or eight shots, I have a difficulty in extracting the shell, as the chamber gets dirty from the smoke or burnt powder which gets between the shell and the chambers. Is this the case with all breech-loaders using brass shells, and is there any way of remedying it? Is there any means of loading buck-shot that it will not scatter more than four or six feet square at 150 or 200 yards? 2d. Do you think it probable that I could become proficient in the art of taxidermy by information I could obtain from books on the subject, with full instructions required by a beginner, and what would be the price? What would a first-class taxidermist charge for a course of instructions? Ans. The trouble is owing to your shell not fitting snug to the shoulder of the chamber. 2d. You could learn by patient practice and some slight instructions. Coues' "Field Ornithology" would be a useful book; it costs about $1.50. We know of no instructor in taxidermy.

JONAH, Selma, Ala.—Please inform me during what months black bass bite best in Southern States, and what is the best bait for them? Ans. Bass fishing is habitually practised in the Potomac in April, and from April to June, at which time the fish run up the river to spawn. We are not sure but that the 1st of May is about the very best time for bass fishing in the Potomac. Black bass is essentially a summer fish. They are taken up to November on Southern waters, and in Florida all through the winter. But the close season, as defined by the law of Virginia, extends from 15th May until 1st of July. The laws of different States vary a fortnight or so from this date. To find the most killing bait in your locality you will have to experiment. Try the artificial fly of various patterns, live minnows, a trolt with spoon or spinning bait. If your waters are large enough, use a sail or row boat and a spoon on two hundred feet of line, with eight-foot rod and reel, or if small ponds throw the spoon near the weeds with a stiff rod, and draw it sideways from the bow of the boat, or skitter with artificial minnow. For still fishing use the tail of crawfish, or bell gramites, frogs, grasshoppers, beetles, worms, earval and the like.

UNDOUBTEDLY one of the best and cheapest stocks of Carpetings, Oil-Cloths, Matting, etc., etc., to be found in the United States is that of Messrs. JOHN H. PRAY, SONS & CO., Washington Street, Boston. J. W. Adams is the sportsman of the firm, and will take special pains to please any of our friends calling upon him, or with any orders sent him. It is a good, reliable house.—*Adv.*

FOREST AND STREAM

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

Terms, Four Dollars a Year, Strictly in Advance

Twenty-five per cent. off for Clubs of Three or more

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line; outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line

*** Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, APRIL 26, 1877.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief lists of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

☞ Trade supplied by American News Company.

CHARLES HALLOCK,
Editor and Business Manager

DON'T YOU FORGET IT.

—On the 1st of May next the office of FOREST AND STREAM will be removed back to its original quarters, 103 Fulton Street.

THE HUNTERS' CAMP AT THE CENTENNIAL GROUNDS.—This structure, which attracted so much attention at the Centennial Exhibition grounds (the registered names of its visitors alone reaching 20,000), was donated to the Fairmount Park Commissioners by the proprietors of FOREST AND STREAM, who erected and exhibited it, and will be a permanent fixture until decay destroys it. Many illustrated papers, including *Harper* and *Frank Leslie*, published engravings of it, and several paintings have been made. The most beautiful of all of them is now on exhibition at the studio of John Kesel, artist, 814 Wood Street, Philadelphia, a photograph of which now lies before us. It is indeed a most charming study, and a pleasant memory of the great Centennial Exhibition days. The size of the picture is 24x28 inches. The price is $200. Were we not poor, we would buy it and hang it up in our sanctum as a lasting memento of the show. The next best wish is that some of our friends may buy it for their own pleasure and satisfaction.

RANGELEY LAKES.—We print to-day the first of a series of articles by Thomas Sedgwick Steele, of Hartford, Conn., on the great Rangeley trout region, Maine. A series of similar letters were issued in September 1874, through the columns of the *Evening Post* of Hartford, and, until the article which recently appeared in *Scribner's*, was about the first to open to the public in detail that interesting locality. Mr. Steele has been one of our steadfast friends from the first starting of the FOREST AND STREAM, and in addition to his reputation as a writer in this and other papers, employs his leisure moments in the painting of trout, which studies have been hung in the various Art Galleries of this country, three of them being now on exhibition at the Academy of Design, corner 23d Street and 4th avenue. Mr. Steele is partner in the firm of T. Steele & Son, importers, Hartford, Conn.

KIMBALL & CO.'S CIGARETTES.—We acknowledge the receipt of a package of fine cigarettes from Kimball & Co., of Rochester, N. Y. Five prize medals have been awarded to this well-known firm. Their smoking tobacco is also much esteemed, and the sales, we understand, are very large.

THE DEER OF CALIFORNIA.

THAT traditional authority, "the oldest inhabitant," reports that "way back in the early days of California there were white-tailed deer to be found in the land." However that may have been in the times gone by, the hunters of to-day find only the black-tailed kind; and around many a camp fire, in yarning time, men are found who say that "the oldest" aforesaid has laid down the rifle for the long bow, and is a dead shot with the latter weapon only. Some hunters say that there are two varieties of the black-tailed deer in addition to the barro deer, and attempt to distinguish them by the names of "brush" and "mountain" deer; the better founded opinion is that they are not distinct varieties, but the same, and that differences in habit can be easily accounted for by the different conditions pertaining to localities—for example: in the County of Los Angeles, Southern California, within a distance of sixty miles from the blue waters of the Pacific, black-tail deer are found, ranging in altitudes varying from ten to ten thousand feet above the sea level, with climatic conditions varying from the semi-tropical plains and valleys perfumed with the sweet breath of orange and pomegranate flowers, to the pine-clad ridges and snowy summits of the Coast Range Mountains. On the coast-line side of these mountains there are no deer save the black-tail, the barro being found only on the desert side, and somewhat rarely there. From the coast line to the main sierra the plains and valleys are intersected by short ranges, ridgy and broken, covered generally with a dense growth of scrub oak, mountain mahogany, some shumate and manzanite, and a great deal of what the native Californians call chemisal, a compound of most everything brushy, including sage, greasewood, poison oak and wild plum. These ranges vary from a few hundred to about two thousand feet in height; and the first five thousand feet of the main range has a similar growth and formation. Above the five thousand foot level the character of the vegetation and the nature of the range change. The slopes and the ridges are longer and smoother, although rocky in many places; and pine and fir timber, to a great extent, take the place of the brush, which, however, is larger, and reinforced by the white thorn, and manzanite in many places maintains its supremacy. The habits of the deer differ so materially in the successive altitudes and temperatures, that our close season, to afford adequate protection, should be almost always in existence in some part of the county. On the coast the rutting season begins in July; on the highest mountain ranges not until October, and in some seasons even so late as December. The times for shedding antlers, dropping fawns, and changing the red coat for the blue, of course vary accordingly. In appearance the so-called mountain and brush deer are precisely similar, except that in the mountain deer the blue coat is darker and the hair thicker; and being seen in a more open country, and often times on high points with only the sky for a background, they appear taller and more majestic. In their breeding habits they vary according to locality, as already stated. The bucks in the rutting season travel further in search of the does, and are fiercer in fight than those of the lower, warmer lands. When hunted, the mountain deer rarely descends or attempts to keep on a level with his pursuer, but at once strikes for the high ridges and points, and if followed, shows no hesitation in leaving his accustomed haunts. He never, unless wounded, doubles on his track or attempts to hide. Depending for safety entirely upon good legs, keen eye, quick ear, and a nose almost equal to that of the mountain sheep, he has little fear of wolves, but finds enemies enough in mountain lions, the larger cats, and in man—Indian and otherwise. He seldom furnishes food for bear, but his fawns are often taken by the eagle and California condor, in spite of the efforts of their dam, who, with eager feet, shows fight, and sometimes loses her own life in endeavors to protect the fawn, but not unfrequently succeeds in escaping with them to thick brush, where the fierce birds cannot follow. The deer found in the brushy hills and plains near the coast have the same enemies, and more of them, except that lions are scarcer, and they are very seldom troubled by the condor, which bird affects the mountains rather than the lower ranges. When the brush deer is hunted, he depends upon circling, doubling back, hiding, and in fact anything rather than trusting to his legs to protect him. He will often allow himself to be approached within twenty or thirty feet in thick brush if he thinks himself unseen, and attempt to sneak back behind his pursuer. The country he inhabits is so dry that he has, except on very damp days, but little fear of being followed by scent, and he knows, by both instinct and experience, that his hope of safety is in the thickest brush he can find. If hunted much he stays in the brush all day, and ranges at night; a moonlight night is his especial delight. He cultivates fat and cunning, and is, in spite of the troubles arising from his close proximity to civilization, a happy sort of a fellow. Like his mountain brother, his domestic cares are few; his are the pleasures, not the troubles of married life. For a month or two he fights and frolics, does the gallant beau, and at the end of the season's dissipations goes back to his bachelor haunts to prepare for another campaign. He leaves family cares to Mrs. Blacktail Doe; she looks closely after family matters, and sees little of her errant lord until all trouble with fawns is over, and they are able to go out on the wide world and shift for themselves. The does of the black-tail deer bear fawns in their second year. The first parturition is generally of a single fawn, after that generally two, and triplets, although rare, are not unheard of. The fawns remain with the doe until the rutting season, sometimes until she is heavy with young, and cases are known, though of unfrequent occurrence, where mother and daughter have dropped fawns together. The fawns are dappled with white spots when born. These spots fade gradually into the red, and are entirely lost with the first change of coat. At the commencement of the rutting season both bucks and does are fat, the former at their fattest; the does continue in good flesh until their fawns are dropped, the bucks speedily run down, and at the close of the season are very poor, their horns soon drop off, and they loaf around singly or in bands of from two to a dozen awaiting the sprouting of another pair. Their once sleek and handsome blue coats begin to look worn and sunburnt, and hang all too loosely where they once fitted tight and snug.

This is their critical time of the year; their systems relaxed, poor in flesh and in spirit, they are peculiarly liable to succumb to disease and the attacks of their enemies. Fortunately for them their flesh is of small savor, and the hunter passes them by—even a tow-head yearling is better meat. In a month or so their horns commence sprouting; two little grey, velvet-covered knobs, appear on the back of the skull, lifting the skin with them; they grow until four or five inches in length; they branch, they grow more and branch more until they are a fine pair of antlers done in velvet; they are quite tender, full of blood, and made out of a soft, bony tissue, under the velvet. Finally this bony tissue hardens into bone, the blood is absorbed, the velvet cover dries and cracks—begins to have a ragged, rusty look. The horns at this season are like pliant steel, in the way they spring back to shape when bent; they itch, and the buck finds great relief in rubbing them against trees and the hard stems of bushes, preferring brush hardened by fire, which has consumed the smaller twigs and the leaves. This rubbing, as nature intended it should, frees the horn from the velvet, cleans and polishes it, until finally it is perfect as a weapon and an ornament. While the antlers have been growing, other changes have taken place: the old coat of hair has changed from blue to red, and in the red has faded, loosened, fallen out, and been replaced by a bran new coat of blue grey. To avoid the pain caused by striking his tender growing horns against the bushes, the buck has taken no more exercise than is sufficient to supply him food; he has slept and eaten well, food has been abundant, of excellent quality; he is fat and strong, and is soon ready for another campaign among the does, to enter the lists at every tourney he can find, and hold them, too, against all comers, to win favors in his lady's eyes. To this writing these are perfect deer, but there are others, too—cactus bucks and barren does—which, from a loss of procreative power, live under changed conditions. The barren does are always fat, generally found alone, and are much esteemed for venison. The cactus bucks, socalled from the supposed resemblance of their horns to the young plant of the *cholla cacti*, present one striking peculiarity: their horns are always malformed, diseased, and never out of velvet. It is almost certain that they are never shed, and are a constant source of annoyance to the deer so unfortunate as to wear them. They grow a gnarled, distorted mass of diseased bone, in almost every conceivable shape, sometimes one horn, often two, like a man's hand, a cactus, a bird's wing, a strangely twisted root, sometimes on one side only, sometimes growing down over one eye or an ear, growing back over the neck, or down the forehead. In every case of this kind the testicles are found to be either injured, diseased, or entirely wanting. The deer are generally in good order, and often fat. In Southern California deer are seldom found in bands, except during the rutting seasons. Traditions of large bands come down to us from "the early days," but bands of thirty are very rare at present, and bands of fifty, occasionally seen in the Tejou Mountains, are regarded as great curiosities. Albinos are sometimes reported in the shape of white and spotted deer, but are so rarely met with that the last well-authenticated case is that of a large spotted doe, in the red, with large, pure white spots, killed by an old hunter at Agua Caliente, in 1846. Hybrids are very rare, and when met with are the result of a cross between the barro deers and blacktails. The barro deer, so numerous in some portions of Arizona, is found in Southern California, only on the desert side of the Coast Range Mountains. In color and in habits generally it resembles the blacktail deer, but is much heavier and of a stouter build; its ears are larger, neck shorter, legs thicker, and its body much squarer set. Its tail is a little larger than that of the blacktail deer, black on top, white underneath, and much shorter than its ear, resembling that of the common "blacktail deer" in color and appearance. It looks like a now model blacktail deer given increased size, modeled and proportioned somewhat after the style of a jackass built for speed, and without doubt was christened "barro" by the Mexicans on account of its general resemblance to the domestic animal of that name. In 1869 one, a buck, was shot near the Forks of the Mojave River, by a hunter of much experience with deer, and by him estimated to weigh three hundred and twenty-five pounds. The average estimated weight of seven killed within a distance of forty miles of the Mojave in 1870 was two hundred pounds each for the bucks, four in number, and one hundred and fifty for the three does. Of about thirty head of blacktail deer killed the same year by the same hunters, only one would have over one hundred and fifty pounds, and the average bucks not more than one hundred and twenty, the does ranging from ninety to one hundred and ten pounds.

NOTICE TO SPORTSMEN.—Having received so many communications asking us for information in regard to our six-section bamboo trout, black bass, grilse and salmon rods, we have prepared a circular on the subject, which we shall take pleasure in forwarding to any address. We keep on hand all grades, the prices of which range from $15 to $150. We put our stamp only on the best, in order to protect our customers and our reputation, for we are unwilling to sell a poor rod with a false enamel (made by burning and staining, to imitate the genuine article), without letting our customers know just what they are getting.

P. O. BOX 1,294.—*Adv.* ABBEY & IMBRIE, 18 Maiden Lane.

PORTABLE SHOOTING BOXES.

WE wish to call especial attention to the advertisement in this week's issue of the portable houses which the Messrs. O'Brien of Yonkers are now prepared to construct for sportsmen and summer sojourners in this country. The accompanying design and specifications give a very accurate idea of their construction, and the uses to which they may be put. The Messrs. O'Brien have had the contract of fitting the rustic work in Gilmore's Garden since that enterprise was initiated.

We have more than once brought this subject to the notice of our readers, and for a long time have labored to induce some enterprising firm to undertake their manufacture for the benefit of those whose purposes they are well calculated to serve. We have ourselves seen these houses put to a variety of uses; and knowing their value, have wondered why our suggestions have been so coldly received by those who we thought would be eager to adopt them. Failing elsewhere, we think we have at last found the right men in the right place. The Messrs. O'Brien have obligingly taken our views into consideration, and after much careful study of plans, which should combine both convenience and cheapness, believe that they can now fill every requirement.

The idea of portable houses is not new. Dwellings, and even churches, have long ago been constructed in sections and shipped to California, South America, and elsewhere, where they have been put together in a brief space of time. Within twenty-four hours villages have occupied places which were previously waste and unoccupied. With equal facility they can be taken down and again removed to other sites more desirable, if such a change be required. We can readily conceive that among a people so restless and fond of change as we of America, especially those who annually seek a temporary sojourn in some summer rural, such a class of houses would prove very desirable. Dissatisfied with a chosen location, or wearied after a time with surroundings that had become monotonous, or necessitated to remove from the seaside to the mountain, or seek a change of climate, no sacrifice of property by forced sale or absolute abandonment would be compelled. Not even the purchase of ground would be involved. Hundreds of choice spots might be temporarily leased which could not be bought. Indeed, advantages various and wonderful can be imagined if not enumerated. Houses of one, three, or even ten rooms can be constructed in this manner, with more or less conveniences and ornamentation, at an expense very considerably less than buildings erected in the ordinary way. For summer recreation they need no lath, plaster, or heavy material. Planed boards, tongued and grooved, laid on ornamental joists and rafters, painted outside in colors, and grained inside to represent any wood desired, can be made highly attractive.

This class of structures, however, does not call for our especial attention. Our desideratum is a cheap building of one or two rooms, put together in the rough, affording comfort only, to be used where the period of temporary sojourn is to occupy a month or more, either as a camp for the angler in summer, or the gunner in fall or winter. It can be shipped to the ducking grounds along the coast, or be used by fishermen engaged in seining. It will serve the thousands who annually swarm upon the ice of the great lakes for winter fishing. It is alike useful as a lodge for game keepers, graziers or herders. It is a complete and comfortable protector against the storms which so often make dwellers in tents miserable. It insures a good, dry bed, and well cooked meals. Such a building, wholly suitable, the Messrs O'Brien can construct for the trifling sum of $135; and when once made, will last for an indefinite time. It is economy itself.

In furthering this project, the gentlemen who advertise have been prompted by no spirit of speculation. They simply endeavor to meet what we believe to be the requirements of sportsmen and others whose pursuits make such a class of buildings desirable; and being sportsmen themselves of long experience are well capable of judging what the requirements of sportsmen are. No doubt numbers of these portable houses will dot the shores of many lakes and mountain streams before two years roll around. Several associations have been formed, owning large tracts of territory, which invite the erection of cottages within their domains; and what can be more suitable than these, and what more easily erected in out-of-the-way places where no facilities exist for house building? We leave the question to the good judgment of our readers; merely adding that such houses are in use in Great Britain, where they are as regularly advertised in the sporting journals as any class of sportsmen's goods.

GAME PROTECTION.

NEW YORK.—We are pleased to learn that our good friend Finigan, of the Utica *Herald*, has been elected President of the Central New York Sportsmans' Club of that city.

RHODE ISLAND.—At the third annual meeting of the Rhode Island State Association for the Protection of Game and Fish, held at Providence, Wednesday evening, April 11th, the following named officers were elected for the ensuing year: President, Henry T. Root; First Vice-President, William E. Taber; Second Vice-President, John Howe; Third Vice-President, Rev. F. H. Hemperly; Fourth Vice-President, Dr. Amos B. Hawes; Fifth Vice-President, William H. Wilmarth; Secretary, L. H. Cutler; Treasurer, C. F. Pope; Advocate, H. B. Whitman; Managing Board, Messrs. Edgar Pratt, Walter F. Mason, James Patterson, William H. Fenner, Jr., M. K. Cowing, Jr., C. M. Carpenter, Preston E. Day (Warren, R. I.), J. K. H. Nightingale, and W. P. Morton.

VIRGINIA.—The Virginia Legislature has recently passed some very important bills relating to fish and game. The first applies to the protection of fish above tidewater, and briefly is as follows:

SEC. 1 prohibits the taking of any fish in the waters of the commonwealth, except bait fish, above tidewater for a period of six years, by any means except angling with hook and line.

SEC. 2 makes a close season for trout (*Salmo fontinalis*) from September 15th until April 1st, and for black bass or pond bass (Southern chub) from May 15th until July 1st, and shooting or spearing either of these fish is prohibited.

The succeeding sections apply to having in possession the use of poisons, etc., and the penalties, the latter of which is fixed at twenty dollars, or thirty days imprisonment for each offence. The act goes into force immediately.

The second act is for the protection of fish in tidewater. The following are its principal features:

SEC. 1 prohibits the use of purse nets in Chesapeake Bay at night or on Sunday, or in any of the rivers or creeks of the State, or within two miles of the mouth of said rivers or creeks. Pound nets are also prohibited in a like manner, and the latter nets are also prohibited in any of the waters of the commonwealth during the months of June, July and August, or in such manner at any time as to obstruct the channels. The act goes into operation November 30th of this year.

In this latter act it seems to us that the framers of the law have erred in placing the prohibition upon pound nets during the month named, instead of the three months preceding, or at least during April, May and June. It is during these months that the great Northern migration of sea fishes takes place, and it has been found that to induce these fishes, such as the blue fish, weak fish, sheepshead, etc., to return to their old spawning and feeding grounds, in the waters of New Jersey and New York, pounds must be abolished during the months named. The mischief is all done before July, and the same would occur in more Southern waters at an earlier date.

The act for the protection of game is as follows:

SEC. 1 makes a close season for partridges (quails) between February 1st and November 1st, and setting or trapping is prohibited until after the expiration of two years from the passage of the act.

SEC. 2 makes a close season for ruffed grouse from February 1st until August 1st, for woodcock between February 1st and July 1st, for robins between April 1st and November 1st, and protects insectivorous birds.

SEC. 3 makes it unlawful to kill or capture any wild water fowl between April 1st and September 1st, except summer duck and sora (rail), and prohibits the killing of wild fowl between dark and daybreak, or the use of any gun that cannot be held at arm's length. Wild geese may be killed either during day or night providing reflectors are not used at night.

SEC. 4 protects wild turkeys between February 1st and October 15th.

SEC. 5 prohibits the capture of mocking birds.

SEC. 6 provides that marsh hens or their eggs shall not be taken before June 20th, or willets before July 20th.

SEC. 7 protects deer from December 15th until August 15th of the next succeeding year. The remaining sections refer to penalties, etc.

MINNESOTA.—The Lake Pepin Sportsman's Club is preparing for a vigorous campaign during the coming season. At their last meeting the following officers were elected: President, G. W. Lemley; Vice-President, L. S. Van Vliet; Secretary, D. C. Estes, re-elected; Treasurer, F. Rueckert, re-elected; Managing Committee, O. Gibbs, E. A. Patton, J. McCroden, Chas. Wise, Wm. Morris, Nate Patton and Chas. Schmuser.

WISCONSIN.—The Legislature of Wisconsin has also passed a new game law. By its provisions ruffed grouse and prairie-chickens are protected from snares and nets, the close seasons remaining the same. Deer are protected by a close season, extending from January 1 to September 15. Insectivorous birds are protected at all seasons. The most important section is that referring to wild fowl shooting on Lake Koshkonong, which we print in full:

"It shall not be lawful for any person, at any time or in any place, upon any of the waters of Lake Koshkonong, or Rock River, in the Counties of Rock, Dane and Jefferson, in this State, to shoot at, catch, kill, wound, destroy, or to pursue any duck or other wild fowl, while bedded in flocks on their feeding or roosting grounds, by the aid, means, or use of any float, punt-boat, sneak-boat, or similar device or structure, however known or called, or to shoot at or pursue by any aid or means whatsoever, any such duck or other wild fowl, between the hours of eight o'clock in the afternoon and three o'clock in the forenoon of the following day; nor shall it be lawful for any person to build, or to use, for the purpose of hunting or shooting duck or other wild fowl, upon any of the lakes, rivers, streams, or marshes, in this State, any sunken or floating boxes or batteries, or any other similar device or structure, however known or called, or to sail for any wild fowl of any kind in, or to shoot at them from any vessel, propelled by steam or sails, or from any boat or other structure attached to the same."

—A New York gentleman camped out in Florida last winter with a party, and they killed 705 quail, 697 snipe, 37 ducks, 63 deer, 10 turkeys, 9 fox squirrels, 1 fox, 8 wild cats, 2 sandhill cranes, 1 cagle, 1 woodcock—grand total of 1,534. He says:

"Had we hunted deer only, all day long and every day, I feel confident we could have killed, at least calculation, 175. But we only killed them as we needed them, and then returned to camp. Though the number we have slain seems large, it must be remembered that the Southern deer are very small as compared with those of the North. If we had used even the whole of the spare time after deer hunting, the number of quail could have been quadrupled, and of snipe doubled. Turkey hunting requires great care and patience, two qualities we did not put to the test to any extent, or we might have killed several more of the noble birds, for there were plenty of them within a mile of camp. Ducks were very numerous, and correspondingly wild.

Please always to bear in mind that we have wasted not a bit of game. If we have had at times more than we needed ourselves we have given it to friends."

—Blackberries are now in season in Florida, and quite abundant.

AN AUTHOR'S HOME.—Charles Lanman, Esq., of Georgetown, D. C., is an embodiment of what is expressed in the simple words, "fishing tourist." As an angler he is better known to the generation of fishermen who are rapidly following Thad. Norris over the border, than to those who are just now stepping *in*. He has fished almost all waters of the United States at a time when the venture required more pluck and hardihood than it now does to go around the world; when stage coaches were, indeed, almost the only conveyances, and steamboats not fairly introduced. The material which he then fished out from the running brooks, lakes and rivers of our country, from the Saguenay to Lake Superior, writing as he went, had a freshness about it which is not apparent now when the book is no longer sealed, and the things then hidden have become familiar objects. Much information has Lanman contributed to the geography and natural history of the country, and it is very creditable to the carefulness of his observations and the accuracy of his statements that many of his observations then made and recounted are now substantiated and adopted by our best scientific authorities.

No doubt, in the present vigor of his ripe maturity, he would disclaim the insinuation that he was *aged*, but the writer of this knew him twenty-five years ago as the "Washington correspondent of the New York *Journal of Commerce*," and he was in the prime of his manhood then. But years do not always bring stiffness or decrepitude, and Mr. Lanman is a well-preserved specimen, hale, hearty and athletic, who would grace the company of H. P. Durell, Esq., of Morrisania, for instance, who at the age of 82 years annually follows the hounds, or takes his day's tramp with his dogs into the stubble and cover. (Incidentally, we may mention here that Mr. Durell has entered one of his dogs—a black and white setter—for the Bench Show to be held next month in this city.)

Mr. Lanman has contributed to this paper, occasionally, from its beginning, and those who know him will be pleased to read the following description of his abiding place, written by one of his admirers, which we copy from a letter in the Cincinnati *Gazette*. When those who have toiled and borne the burden of the day are able to take their rest and reward with dignity and comfort, it kindles in a sympathetic brotherhood that fellow-feeling which makes the whole world kin, and makes us all happy to see it:

"Mr. Lanman's house is a veritable museum. He is a thorough literary and artistic man, and believes in gathering around him the wonderful and beautiful objects met with through life, rather than furnishing a homeless feeling house with gorgeous satin and sumptuous gildings, which are too handsome to suggest comfort in their use. The walls of his attractive home are decorated with beautiful pictures in oils and water colors, many of them the production of his artistic brush, while rare old books, and piles of engravings, and articles of virtu fill up all the brackets and nooks, with that enjoyable prodigality seen only rarely, and then in the residences of men of artistic readings.

"Your correspondent has visited Mr. Lanman's residence lately, and is therefore able to complete the above description. The house in question, which is small and unpretending, is flanked by a combination of garden and lawn nearly an acre in extent, and adjoining it is the old homestead where the "lady of the mansion" was born—something unusual in this age of transitions. The rooms are small and always open to the sunshine; fire-places and Franklin stoves take the place of furnaces; books and pictures are substituted for rich and desolate furniture; and every nook from garret to cellar is cozy, plain, and pervaded by the spirit of *home*. Of books there are perhaps 3,000 volumes, among which are many autograph copies, and an ample store of travel, sporting volumes, and illustrated works on the fine arts. Among the pictures in oil, water colors, and in black and white which meet you in every direction, may be seen original productions by such men as David Cox, T. S. and Abraham Cooper, Eastlake, Hulme, Phillip Copley Fielding, and other English celebrities; some good things by French artists, and representative productions by such Americans as Church, Huntington, Durand, Leutze, Eastman, Johnson, A. Fisher, William Hart, White, Casilier, Oertel, Weber, Hamilton, Gegrioux, Edmunds, Cole, Sully, G. L. Brown and others. Of works which have come from the author-artist's own hands, a collection of more than twenty volumes would naturally attract attention, among which are several beautifully printed English editions, and packed away in portfolios are to be seen hundreds of original sketches in oil of American scenery, ranging from the Saguenay River and Lake Superior to the Gulf of Mexico. The visitor who has a fancy for rods and reels and artificial flies may discover in one of the out-of-the-way corners something less than a cart-load of such stuff, which has assisted the owner and made him happy in killing salmon in Canada, black bass in the Upper Mississppi, and various kinds of fish in the waters of Florida and Alabama. One particular shelf in this home of a hard-working author, which once contained a vast number of autobiographical letters from Congressmen, and which were sold for five thousand dollars after the sap had been taken out of them for the "Dictionary of Congress," is now filled with the private correspondence of Mr. Lanman's personal friends, including eminent authors, artists and statesmen, and among which are many letters of great beauty and historical value. But one of the brightest attractions of Mr. Lanman's home is the presence of a Japanese child, now just twelve years of age, whose instruction he is superintending in this country, who speaks English fluently and whose name is Ume Tsuda, and as he has for several years been officially connected with the Japanese legation in Washington, he has not been backward in filling his home with curiosities from the Far East. Of Oriental books and pictures, choice porcelain and lacquer ware, swords, shell and bronze productions and beautiful costumes, there is a rare supply, but perhaps the one particular thing that would be most generally coveted is an edition of Japanese poetry, in three tiny volumes, written only about nine hundred years ago."

—Dr. J. Willis Houston, of Collapier, Chester County, Penn., has for sale a unique cabinet of woods, which is composed of 140 species and 90 genera. The woods are turned into cups for holding mineral specimens—140 cups, each cup and lid representing a distinct kind of wood. It can be bought very reasonably.

IN MEMORIAM.

THE guild of anglers has lost a master of the gentle art. Thaddeus Norris, of Philadelphia, widely known throughout the country as a teacher and authority on fish and angling, has passed away. Suddenly but painlessly he fell into his final rest on the 11th of April, 1877, at his home in this city.

To those who enjoyed intimate companionship with him no words the writer can pen are needed to keep his memory green; still, a duty remains to outline, however feebly, some of the characteristics of an angler whom Walton would have loved as a kindred spirit. To attempt to furnish even a brief record of the events of his life is not the writer's purpose. It will be sufficient to notice that he was born near Warrenton, in Virginia, in 1811, and that at an early age he removed to Philadelphia, which was his home for the rest of his life. He acquired, as a boy, a love for fishing; but, to quote his own words, he "never became an angler until he ceased to trust in the flesh"—that is, had abandoned the bait and learned to cast the fly. But this latter art, once acquired, became a delight of his life; and an experience of over thirty-five years' practice as a fisherman in one so patient, so close in observation, and so fair in his conclusions as Mr. Norris, gave his name deserved weight with naturalists and savans, as well as anglers, in all questions touching the genera, habitats and characteristics of fish, as well as the best methods for their capture.

The special charm in Mr. Norris to his brother anglers was his subtle and artistic perception of all that is poetical and beautiful in the surroundings of the angler at his sport, and his power to portray truthfully and impressively the comfort and delight they imparted to his own physical and spiritual being, by bringing him into the closest contact with the wonderful and beautiful creations which the great Maker and Builder hath wrought in His handiwork, which we call nature. To some men life in the woods and by the stream is a kind of inspiration. If Thoreau had been an angler he would have been one after the heart of our departed friend. And the reader of Mr. Norris' miscellaneous sketches at the conclusion of his "American Anglers' Book," especially the two entitled "Fly Fishing Alone" and "The Angler's Sabbath," will in some measure comprehend, if he has the stuff in him whereof the true angler is made, how closely the writer of them dwelt to nature's true "inwardness," and how keen was his appreciation of the secrets which the woods and waters reveal to those who love them.

For twenty years I was his companion in many of his excursions to the mountain streams for trout fishing, and while in expertness, perseverance and keen relish for luring the wary trout to his fly he had few superiors, it was not by these that he made a trip in his company one long pleasure. The vista down the stream underneath o'erarching boughs; the sturdy or graceful forms of the various trees, according to their kind; the exquisite forms of vegetable life as shown in the mosses, ferns and lowly growths of the forest and along the margin of the stream; the aromatic balm of the air, laden with the resinous odors of spruce and hemlock; the habits of birds and insects; the expressions and colors of the dawn and sunset; the changing face of a familiar landscape under varying skies, with alternations of lights and shadows—all these things fed his soul with joy and moved him to the utterance of devout gratitude to God, who thus opened His storehouse of wonders and beauties to all His children, and made His best gifts common to all the race.

Possessing great mechanical gifts, he was led on little by little to essay making his own implements for his spring and summer campaigns, and in time acquired such great facility and such accurate knowledge of the best materials for their construction, that his rods and flies, in the judgment of many experts, had no superiors. He was ever full of sympathy and encouragement for every novice in angling or tackle making who chose to appeal to his stores of useful knowledge for suggestions or aid. The boy who loved to go a-fishing always found the soft spot in his heart; and his love for children was as remarkable as his success in winning them to love him. He ever manifested the heartiest sympathy and respect for the worthy poor, and his sudden departure will be mourned in many a lowly home where the dwellers had had their burdens lightened and their hearts cheered by a friend whose interest in their welfare they knew by an infallible instinct was genuine and sincere.

Without professing any ability for literary work, his accurate knowledge and his thorough appreciation of the subjects of which he wrote, enabled him to produce one of the most instructive and entertaining books on angling which has ever been published, while his work on pisciculture is recognized as a standard authority on a subject now engaging widespread attention.

His experience in angling was wide and varied. From the lordly salmon to the smallest member of the finny tribe, he had captured many varieties, and in many waters. But after all this experience was attained, he was ever ready to confess that his highest enjoyment from the sport was attained by an excursion with a congenial spirit to a mountain trout stream which he could wade, and along which he could wander at will, taking in due season his "nooning" and rest for the impromptu dinner, made up in good part from the morning catch, and where the pipe and sweet discourse which followed whiled away the time until the afternoon sun lowered to the proper point for beginning the evening fishing, which was protracted into the gloaming—this was, in his opinion, the crown of the angler's delight. How often has it been the writer's privilege to enjoy these scenes with him! What a delightful companion he was, ever cheerful, fertile in resources, full of knowledge in all things pertaining to the craft! What a droll raconteur! How vividly he could depict the amusing or grotesque points of the queer people he had met, how full of verse and song and story; and withal how noble, how unselfish, and how warm-hearted! Dear Uncle Thad! never again shall we take our diversions together, or revisit the scenes of our former exploits by the limpid waters of the mountain streams, where our friendship was strengthened to a true brotherhood!

But if this feeble tribute to thy worth and admirable qualities shall help to lead the younger band of enthusiastic anglers to emulate thy example, by cultivating the habit of so using their wanderings in quest of recreation that they shall grow in useful knowledge, in the spirit of humanity and charity, in love of God and their fellow-men, then it is fit that out of a full heart these few feeble words have been spoken. JOE.

Philadelphia, April, 1877.

—Barton & Co., who were the concern of Barton, Alexander & Waller, the well-known dealers in guns, fishing tackle, pocket cutlery and sportsmen's goods of every description, have recently removed to 337 Broadway, where they have a very full and complete stock, embracing every standard article or popular novelty connected with the sportsman's outfit. They are extensive manufacturers of many important lines of goods, their fish-hooks, lines and tackle having long been in high favor with the fishing fraternity. They are extensive importers, and can supply guns and gun material, powder flasks, ammunition, etc., from all the leading foreign or American manufacturers. Their new store is a model of elegance and taste, and sportsmen may spend a pleasant hour in looking through their really wonderful collection of novelties.

OBITUARY.—D. M. Boyd, Esq., General Passenger Agent of the Pennsylvania Railroad, died recently in Florida, where he had gone for his health. Mr. Boyd was a keen and thorough sportsman, and has always used whatever influence he possessed to promote legitimate sports and assist sportsmen in their pursuit. He was always a warm personal friend of the proprietors of this paper, who will ever regret his untimely taking off.

We regret that Governor Robinson should have vetoed the bill which had already passed the Legislature, providing for the erection of fish passes in all dams in this State.

Rifle.

CREEDMOOR.—The regular Saturday's match at Creedmoor, last week, was the third and final competition for the *Turf, Field and Farm* gold medal. Mr. William Hayes, the well-known short-range shot, was the successful man, although his score of 43 points out of a possible 50, was tied by Capt. W. R. Livermore, U. S. A. Unfortunately for the latter, however, his score contained two inners. Mr. Hayes having won the badge on two previous occasions (on scores of 42 and 43), now retains possession of the trophy. The weather was by no means favorable for good shooting. The conditions were 10 shots at 200 yards, any rifle within the rules. There were forty-two competitors, of whom we give the scores of those who made 35 points and over.

Name.	Total.	Name.	Total.
William Hayes	43	John Cavanagh	38
W. R. Livermore	43	Homer Fisher	38
J. L. Price	41	D. F. Davids	38
S. Sarjeant	40	H. G. Walcott	38
L. C. Bruce	39	N. D. Ward	37
J. R. B. Bayly	39	T. Dyoll	37
E. Griffin	39	H. F. Clark	36
S. S. Leach	39	J. W. Todd	36
H. W. Gourley	38	E. W. Caulee	35
Lewis Cass	38	R. H. Keene	35
W. Holburton	38		

MILEY GALLERY.—The contest at the Miley Range for the gold pen prize in the Press match, ended Monday night. But few contestants entered the lists, and but two took anything like a leading position in the match. The winner of the prize was Mr. Angell, Mr. Chadwick being second on the lists. The best three targets in the contest was 45, 44, and 44, making an aggregate of 133 out of a possible 150. The next best targets were 46, 41, and 41, giving an aggregate of 128.—*Brooklyn Eagle.*

A friend in Ashbysburg, Kentucky, writes:

"I have been reading the FOREST AND STREAM for over a year, and like it better as I get acquainted with it. I take a great interest in the rifle department, and, although I do not use a modern breech-loader with all patent appliances, I think I can hold my own with the most of the New York crack shots up to 200 yards off hand. I use an old-time muzzle loader, and can kill a squirrel four times out of five at 50 yards with it. I killed two the other day at one shot with it. I have been thinking of laying it aside and getting a breech-loader, but have not seen one yet that I could shoot like my trusty muzzle-loader. They are all so short and light, and above all, the abominable single trigger that one has to pull all his might to get off. PADDY O'LEARY."

We have a high opinion of the old Hawlen Rifle, whose efficiency was tested by Daniel Boone and his contemporaries, and we have seen some tall shooting done with it; but we think our correspondent will admit that there are better arms after he has had an opportunity to test them. Eighteen months ago, when we were in the mountains of Tennessee, we had a shooting match for "beef,"—that is, a shooting match was called; but when the mountaineers saw a Springfield rifle shoot, they quietly withdrew the "cutter" and drove it off, spending the rest of the day in examining, admiring, and testing this new weapon, which they "allowed" could "knock the hind sights clean off" their long squirrel guns. Still there are certain indications that for match shooting the muzzle-loading rifle is about to regain some of its lost prestige. Many of the Creedmoor experts will use muzzle-loaders in the long range matches this season. The question is one not so much of accuracy in the weapon itself as in the ammunition. It is an admitted fact that "unaccountables" are more frequent with breech-loaders than with muzzle-loaders.

CALIFORNIA.—The spring meeting of the California Rifle Association was held at San Bruno on the 11th inst. The meeting was in every way a success, and the shooting shows a remarkable degree of improvement on the part of the riflemen. Following is a summary of the matches and scores. Military Short-Range Nursery Stakes; distance, 200 yards; five rounds; position, standing:

Name.	Total.	Name.	Total.
Philo Jacoby	22	John G. Leibert	19
Philo Jacoby	21	E. H. Ladd	19
E. H. Ladd	21	H. C. Smith	19
Louis Barrere	21	T. N. Carey	19
H. C. Smith	21	J. K. Phillips	19
J. S. Campbell	21	Major D. W. Laird	19
Major D. W. Laird	20	H. C. Smith	18
Frank C. Alton	20	J. K. Phillips	18
Louis Barrere	19	Thos. Macauley	18
J. S. Campbell	19	J. S. Campbell	15

Pacific Life Challenge Cup, 200 yards, any rifle under the rules. The winner in this match shot with a Rigby rifle:

Name	Total.	Name.	Total.
Henry C. Smith	24	E. H. Ladd	20
Henry C. Smith	23	Sergeant Chas. P. Le Breton	20
Henry C Smith	23	Captain J. E. Hughes	19
Sergeant Chas. P. Le Breton	22	J. W. Maher	19

Sergeant Chas. P. Le Breton	21	T. N. Carey	18
Captain H. J. Burns	20		

Kellogg Challenge Cup, open only to active members of the N. G. Distances, first stage, 300 yards; second stage, 600 yards; rounds, five (with two sighting shots), at each distance; position, 300 yards, standing; 600 yards, any, without artificial rest, and if recumbent, with the head toward the target; weapon, U. S. Springfield rifle. There were twenty-six entries, fifteen of which made fifteen points and upward at the 300-yards range, under very provoking circumstances as to unsteady wind, and of the fifteen, only five made above 10 points at the 600-yards stage. The cup was won by Sergeant Warren, of the Union Guard, Second Regiment, who holds it until the Fall Meeting of the Association, when it will be again competed for.

The Regimental Team Match was shot at 200 yards by teams of ten men, ten rounds each. But three teams competed, being from the First, Second and Third Infantry respectively. The first named was the winner, the scores being respectively, 409, 367 and 352 points. As the winners are likely to visit Creedmoor to contend in the Inter-State Match we give their complete scores at the 300-yards range:

FIRST INFANTRY—COLONEL GRANNISS.

Name.	Score.									Total.
Charles E. Burgans	4	4	4	5	5	5	5	5		4—45
Corporal T. E. Carson	5	4	4	4	5	4	4	4		4—42

Total										409

—The Central New York Sportsmen's Club held its annual meeting Saturday evening. Officers and delegates were chosen as follows: President, J. J. Flanagan; Vice-Presidents, I. C. McIntosh, W. B. Sutton, Dr. Chas. W. Shapley; Prosecuting Attorney, Thomas E. Kinney; Secretary, W. M. Storrs; Treasurer, John D. Flowr; Delegates to the State Convention, Chas. W. Hutchinson, E. B. Graham, E. Z. Wright, I. C. McIntosh, J. J. Flanagan.

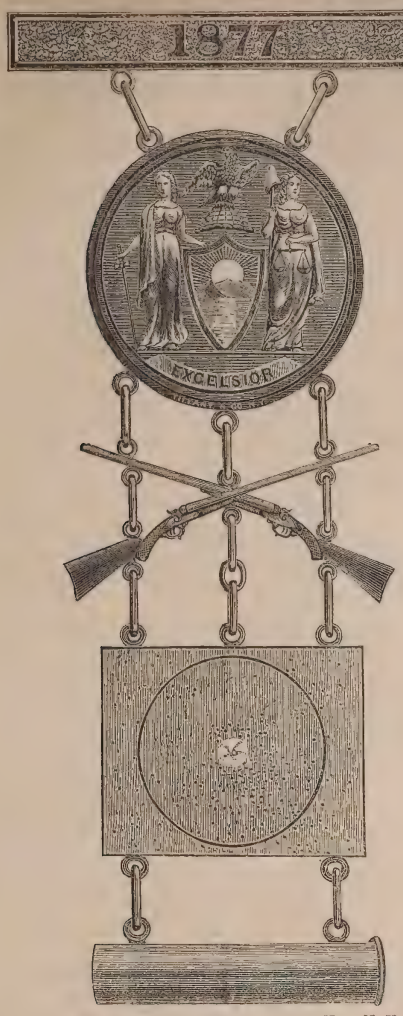
Game Bag and Gun.

MAY IS A CLOSE MONTH FOR GAME.

MR. LANE'S EXTRAORDINARY GUN.—The gun referred to below in Mr. Lane's letter to Mr. Ritzmann, the gun dealer, is certainly a remarkable tool, but we don't think it would "shute that-a-way, stranger," if brother Lane wern't behind it:

MR. CHARLES L. RITZMANN,
943 Broadway, N. Y.

DEAR SIR—The gun you imported for me is the smartest and best shooting gun I have ever seen, especially for long shots. I have killed ducks and geese at 100 yards. I use 6 drachms powder, 1⅛ ounce No. 1 shot. I think if I were to put in 3 B shot, I could kill a goose at 125 to 150 yards. I did not think it possible to make a gun to shoot the way mine does, and if a goose comes within 100 yards of the muzzle of the same, it is as good as dead. The first shot I fired out of it killed a sea-gull full 150 yards, and I have killed ducks out of a boat full as far a number of times. You can order another gun like this one, and have it 10-bore, 32-inch, 10½ pounds weight. Have the chamber bored to take a 3-inch shell, so I can put in plenty of powder. Let me have it as soon as possible. My gun takes the shine off them all.



Yours, truly, WILLIAM LANE, Good Ground, L. I.

Mr. Lane's gun is 10-bore, 38-inch, 14 pounds weight.

WOODCOCK AT QUEBEC.—The Quebec *Budjet* says that Mr. Portugais, the veteran sportsman, has again succeeded in raising the first woodcock of the season, on Wednesday afternoon, at Lorette, a feat he has accomplished for 36 years consecutively. Lorette is a suburb of Quebec.

NEW JERSEY—*Red Bank, April* 23d.—The snipe shooting in this vicinity has thus far been a failure. I have hunted for them since April 2d, and cannot report any larger bag than five. I give a few hours every morning, and find from one to five, just about enough to break my dog on. I sent four pair to Warwick, and he pronounced them to be as fine spring birds as he ever saw. "Check Cord" cannot be induced to shoot a spring snipe. WILD.

—Our Barnegat correspondent, "B," writes: "Shooting for wild fowl is done for the season. The cormorants (the last in the spring and first in fall of the duck tribe in their migratory flight) have put in their appearance. I have noticed a few bay birds. Mr. W. E. D. Scott killed the first willet yesterday. Mr. Scott, who is Curator of the Museum of Natural History of Princeton College, N. J., having done Florida and our Western States, is now stopping at the New York Club House, engaged in collecting specimens. He has so far obtained some twenty varieties. We are anxiously looking forward for our fishing season. Bluefish show themselves here from between May 18th and June 7th. Some flounders are still being caught. We anticipate catching a few blackfish the coming week. B.

STATE BADGE PRESENTED BY GREENE SMITH, ESQ., TO BE SHOT FOR AT THE NEXT N. Y. STATE SPORTSMEN'S CONVENTION AT SYRACUSE.

THE sportsmen of Middletown, Conn., met on Tuesday evening, April 17, and formed a club for the protection of fish and game in Middlesex County. The sportsmen of this county are beginning to awaken to the idea that laws are of no use without they are enforced, and this is a great move in the right direction, as it has been with profound regret that the true sportsmen of this county have seen the *extermination* of fish and game in this county, simply from taking them without regard to law or season. They will proceed at once in the most advisable manner for the protection and increase of both fish and game in our forest and stream.

W. P. P.

MINNESOTA.—*Lake City, April* 16.—Weather fine. Ducks seem to have gone by us thus far this spring, very few being seen. No sporting news to report. E.

GLASS BALL TRAP SHOOTING.—We report the following by Lake Pepin Sportsman's Club, not on account of the good scores, but to show that shooting glass balls is one thing, and shooting pigeons is altogether another. Last Tuesday afternoon, G. F. Benson, Esq., invited the Club to a ball shoot, which was new to us all, but very lively and exciting. The following is the remarkable score:

Ed. Patton	0	0	0	0	0	0	0	1	0	0	0—1
S. B. Dilley	0	0	0	0	0	0	0	0	0	0	0—0
James McCroden	0	0	1	1	1	0	0	1	0	0	0—4
Charles Smyth	0	0	1	0	0	0	0	1	0	0	0—2
Charles Schmuser	0	0	0	0	0	0	0	0	0	0	0—0
A. Glines	0	1	0	0	0	0	0	1	0	0	0—2

Come this way, Father Bogardus. E.

DUCK HUNTING ON THE NEW HAVEN MARSH.

HURON CO., O., April, 1877.

EDITOR FOREST AND STREAM,

Early Monday morning, March 26, we started for the extensive marsh surrounding the Great Pigeon Roost. The party consisted of four jolly boys, each armed with good breech-loading shot-guns. Our outfit consisted of tent, 9x9, and camp-chest filled with substantials. One article of our outfit, namely, the camp stove, is worthy of mention. It was simply an oblong bucket 18 in. long, 13 in. wide, 12 in. high, with two holes in the top, one for the pipe (3 in.), and one 7 in. hole to cook over; a bail was attached to carry it when packed. It is simply turned upside down, and when the pipe is put on it is ready for a fire. Our hunting ground was a half-mile away from our camp. The thermometer was falling fast, and the ducks were passing over us in large flocks, but far out of range of our guns. We sat in our blinds till night-fall without even a shot. When the morrow came, colder weather came with it; the next day came and still cold; not a duck to be seen; one of our party got so disheartened that he concluded to take the tramp, nine miles, home. But during the third night it turned warm, and the morning bright, with a warm sun shining, and a smart breeze from the South. As I was preparing breakfast, we heard the report of a gun in the woods below our camp, and on looking out, I never saw such a sight. Thousands of ducks were rising out of the marsh in the woods, and hundreds were circling in the air in all directions, and a goodly number settling in a pond not 300 yards from our tent. It is useless to say we ate but little breakfast. Two of us crept down a fence from our camp as close as we could get, and then found we were out of range. I told my companion to slip back to camp and get the rifle (which was a light 32-calibre). With this we got one bird, and when the affrighted flock rose and circled near us, I raised my Nichols & Lafever, and fired both barrels. The ducks were full sixty yards away, but I dropped four.

We now had five ducks to use for decoys. To use dead decoys in two feet of water, we take a stick three feet long, sharpen one end, and force it through the feathers at the breast, pass it up the neck into the head; push the other end into the mud at the bottom, and your ducks then assume an upright and life-like position. We had prepared our ducks as above, my friends taking three to the woods below, and I setting out two in the pond where I had killed them. The shooting was rather poor until near evening, when they came in clouds. They at first passed over me and flew on to the woods below, when the boys would let loose at them; then they would come back to my ground. I first occupied a kind of blind between two trees, and they came so fast I could hardly get the dead ones gathered until another flock would settle down. I finally abandoned my blind and sat on a muskrat house, and they came so fast it reminded me of

"Mother Bond, when she went to the pond,
And cried, dill, dill, come and be killed."

We shot till long after nightfall, and when we quitted shooting we had to make two trips to get all the ducks to camp. And I found my friends had got as many as I, if they did not shoot so often. Our bag consisted (after the next morning's shooting) of 41 pin-tails, 37 red-heads, 11 teal, 19 mallards, and 2 shovelers. After eating an early dinner, we loaded our boat with ducks, and two of us took tent and traps and floated down Honey Creek to Attica, our home, while our friend "footed it" to the same place. J. W. SHULTZ.

TAXATION OF GUNS.

EDITOR FOREST AND STREAM.

A tax on guns would of course be very unpopular, but it is the only efficient way I can see of saving our stock game. Every boy big enough to carry one can get a gun, so numerous are they, and during a severe winter the destruction wrought by these predatory fusileers is incalculable; not only the animal increase but the parent stock is destroyed. Your proposed tax on dogs is excellent, but will be equally objectionable to "Dexter," *et omne genus*. I shall disappoint him in the view I take of farmers reserving the right of shooting, by most strongly advocating it. It is their interest to do so, for game birds, especially quail and grouse, destroy numbers of insects, and in return for the grain they eat afford delicacies for the table and sport for their friends. If there was a redundancy of game in the country it would be well enough to allow people to shoot to their heart's content; but the time has passed for that, and unless some very stringent measure is adopted we shall have nothing but glass balls and gyro pigeons to shoot at. In England great care is taken that the stock is not killed—only the animal increase. If no limit be put to shooting, what sort of sport can one expect to have in the ensuing seasons? VEXATOR.

The Kennel.

THE NEW YORK BENCH SHOW.

ALTHOUGH our paper is dated on Thursday, we go to press on Wednesday morning, the day advertised as the last on which home entries will be received, but as the catalogue must remain open until May 1st for foreign entries, we can see no reason why others should not be received up to the same date. We cannot, therefore, in this issue give the total number of entries, but there is every indication that four figures will be reached. Certainly, taking into account the number of litters of puppies, the individual number of which do not appear in the catalogue, the total number of dogs on exhibition will exceed one thousand. A number of railroads in addition to those enumerated last week have notified the Superintendent, Mr. Lincoln, that they will carry dogs to and from the show free of charge when accompanied by their owners. These letters are now being reproduced by the photo-lithographic process, and each exhibitor beyond the city limits will receive a fac-simile copy of the letter received from the Superintendent of the road on which he is supposed to travel.

Mr. Macdona has written to the Chairman of the Bench Show Committee, announcing his intention of sailing from Liverpool in the White Star steamer Adriatic on the 19th inst., so that he may be expected to arrive within the next forty-eight hours. Mr. Macdona brings with him the red Irish setter dog Rover, whose portrait adorns the current issue of the London *Field*, he having been selected by "Stonehenge" as the true type of that strain for illustrating the new edition of his "Dogs of the British Islands." Rover is own and litter brother to Plunket, being by Beauty out of the Rev. R. Callaghan's Grouse, and the latter gentleman writes to "Stonehenge" that Plunket was bred by him, and not by the Hon. D. Plunket, as stated in the Stud Book. Rover, in color, is of a beautiful rich red, with a frame of great size, symmetry and substance, with good feet and legs. He has never been exhibited even in England, so that his first public appearance, not as a competitor of course, will be in New York. Moreover, Mr. Macdona writes to Mr. Tileston, of the Westminster Kennel Club, as follows: "As soon as I land in New York I will give Rover into your charge until my return on May 12th (Mr. Macdona's return passage has been already engaged in the Britannic, which sails on that date). During that time Rover shall be at the service of American breeders, free of charge, for any English, Irish, Scotch or American bitches that may be sent to him." The liberality of this offer is beyond all praise.

Mr. Macdona also writes that His Grace the Duke of Hamilton has informed him of his intention to send one of his best greyhounds to the show. Mr. G. de Landre Macdona sails on the 23d inst., on the Nevada, with Ranger II, Magnet (English setters), Bule, Irish setter bitch by Magnet (a son of Plunket), out of Brosna, three Irish setter whelps by Rover, and a brace of his best St. Bernards, Mungo and Neva, a daughter of champions Alp and Hospice, in pup to Prince, one of the grandest St. Bernard dogs in England. In addition to these, one of the principal of English breeders has cabled entries of five mastiffs, so that it is highly probable that there will be a fine representation from the mother country.

We omitted to mention above that we shall print next week a copy of the London *Field's* portrait of Rover. The *variety* of dogs will be largely in excess of anything yet seen in this country. In addition to the large class of toy dogs, there have been entered Esquimaux dogs, Japanese spaniels, pugs in large numbers, and many other breeds rarely met with. All the most celebrated sporting dogs of every strain will be present. Mr. L. H. Smith, of Strathroy, Canada, sends his entire kennel of celebrated Field Trial dogs. Mr. Raymond exhibits his Laveracks, and Mr. Morford his orange and whites. Mr. Jarvis will be on hand with Elcho and Kathleen, and Mr. Farrer with Plunket, Carrie and Rapp. But we might go on and name nearly all the well-known dogs in the country. Perhaps the pluckiest man, and the one in whose success we take the liveliest interest, is Mr. Jesse Sherwood, of Edina, Missouri, who transports his entire kennel from that immense distance. And yet Mr. S. B. Dilly, of Lake City, Minnesota, almost equals him, for he brings with him the great Ranger and his other pointers. To such of our readers as are not exhibitors, we would say that if they wish to see the grandest collection of dogs ever brought together on this Continent, they should not fail to visit this show.

The prize in the champion pointer class for dogs is a magnificent one—painting of game by Case, of Springfield—presented by members of the Rod and Gun Club of that city, and valued at $150. The prize for bitches in the same class is the cup presented by Gen. Alex. S. Webb, and manufactured by Messrs. Tiffany & Co. The prize for champion English setters (dogs) is the "Spratt's Patent" ten guinea cup, also manufactured by Messrs. Tiffany & Co.

—Mr. Lloyd T. Montgomery of New York claims the name of Dash for his red Irish setter dog pup out of Mr. Chas. H. Raymond's Bonnet Carre, sired by Mr. Wm. Taylor's imported red Irish setter Carlo. Dash was whelped December 25, 1876, and has some very fine points.

DEATH OF MR. LAVERACK.—The last issue of the London *Field* contains an announcement of the death of Edward Laverack, the king of setter-breeders. Mr. Laverack had been almost at death's door for some time, and during that period he had been kept in ignorance of the bitter controversy which had been, and is still being, waged through the columns of the *Field* regarding the merits of the strain of setters with which his name is so closely connected, and the influence their blood has had on other strains when crossed with it. We quote from the columns of the paper named to show to what an extent the blood of Mr. Laverack's strain is diffused throughout Great Britain. A correspondent who is taking a part in the fight says: "Taking as my basis the 'Kennel Club Stud Book,' which embraces all winners at public field trials and shows of any importance down to the close of 1875, I find there are in all 219 English setters, of which 103 are either pure Laverack, or, at least half-breed Laverack, and 27 others are part Laverack, leaving but 89 which inherit no Laverack blood. Again, taking the records of 1874 and 1875—I cannot give 1876, for the volume for that year is not yet published—it will be found that there were 69 winning English setters for those years, 42 of which were either pure Laverack, or at least half-breed Laverack, whilst 13 others inherited Laverack blood to some degree, leaving but 14 outsiders. These figures would doubtless have been still more in favor of Mr. Laverack's breed had that gentleman run his dogs at field trials."

The person who, over the signature of "Setter," set the ball rolling, and who, of course, is either Mr. Llewellin himself or Mr. Buckle, may be said to have made a "pretty kettle of fish" of it. In reply to one of his latest, which is an attack on both Ranger and Plunket, Mr. Macdona makes the following serious charge, which, if not disproven, will probably convince Mr. "Setter" of the folly of commencing a newspaper war. Mr. Macdona says: "From the internal evidence of 'Setter's' letter, displaying, as it does, an intimate knowledge of Mr. Llewellin's kennel, I cannot help coming to the conclusion that he may be able to recall the condition upon which Plunket was sold, 'that I was to have his stud services free.' The first and only application I made for the fulfilment of this stipulation I was denied, until I (foolishly, I admit) forwarded to Mr. Llewellin his own letter to me, in which the stipulation above-named was expressly made. That letter has never since been returned. Plunket was then, however, for that once, allowed to be put to my Brosna. Music was one of the litter; the puppy I sent to Mr. Llewellin was another; but 'Setter' states 'it was shot, as being useless.' I did not shoot Music, but won with her the Puppy Stakes at Vaynol, and on the field of her victory I presented her to the gentleman who so kindly lent his estate for the field trial."

Since the above was written we have received the following letter:

PHILADELPHIA, April 21, 1877.

EDITOR FOREST AND STREAM.

The sportsmen of our country will be pained to learn of the death of Mr. Edward Laverack, the veteran breeder of the noted strain of setters that bears his name.

I am to-day in receipt of a letter from a bosom friend of Mr. Laverack, in which he says: "Perhaps even before you receive this you will have received the sad intelligence of the death of my friend, Mr. Edward Laverack, who departed this life April 4, 1877, and was buried on the 7th in a village churchyard called Ash, about two miles from his residence, Broghall cottage. Mr. Laverack's kennel of setters was divided between his dear friend Mr. John R. Robinson of Sunderland and his housekeeper, Mrs. Whitbaker, the latter selling Prince, Cora and Blue Belle to a Mr. Bowers. It was Mr. Laverack's wish that his friend John R. Robinson should keep and continue the breed pure, and the method of his breeding was imparted to Mr. Robinson shortly before Mr. Laverack's death." HOMO.

THE SIRE OF ROB ROY.

HILLSDALE, Mich., April 16th, 1877.

EDITOR FOREST AND STREAM.

"Vaquero," in your issue of the 12th, quotes from a letter of Mr. Macdona's to the *Field* (London), in which he gives Blue Dash as the sire of my Champion Rob Roy. I wish to correct this, as it is an error that may make trouble in these days when pedigree is so important. Rob Roy was sired by Statter's (afterward Laverack's) Fred, he by Pilkington's Rock, out of Laverack's Belle II. See errata of Vol. 3 English "Kennel Club Stud Book," pedigree of Roke, Rap, Ruby, and Rose, all brothers and sisters to Rob Roy.

I do not intend to take up the cudgels for "Mr. Setter," whoever he may be, but I will make the statement, and refer your readers for proof of truth or falsehood to the three Vols. of the Kennel Stud Book, that since the first appearance of the Duke and Rhoebe blood in 1870, the dogs with those strains crossed to the Lavereaks have not only beaten the pure Lavereaks, but have now more prizes, both on the bench and in the field, than the dogs of any other breed. I will say also, and refer to the same authority, that old Rhoebe is the dam or grand-dam of more prize winners than any bitch ever known, so far as we have public record. No other bitch can show *three sons and a grand-daughter*, winners for *four consecutive years* of the *Shrewsbury Championship*, and in her case the sons were all got by different dogs, the highest possible proof of the good quality of the dam herself.

It is but mere justice to Mr. Llewellin, to whom Mr. Laverack dedicated his book, as one "who has endeavored and is still endeavoring, by sparing neither expense nor trouble, to bring to perfection the setter," to say that since he obtained the Duke and Rhoebe blood, he has bred and exhibited more winners at shows and trials than any other setter breeder in England during the same time; and further than this, his kennel has produced more dogs that have won both on the bench and in the field than have ever sprung from any one setter kennel. In proof of this I appeal to the Stud Book and the reports of the London *Field*. Disparagement of Mr. Llewellin's dogs should come from any other quarter than from the owner of Ranger, who has been three times beaten by dogs of Mr. Llewellin's breeding, viz., Laura, Druid, and Countess Bear, all descendants of the Duke and Rhoebe blood, and the latter a fifteen months puppy, at the time she scored her victory.

ARNOLD BURGES.

Admitting the truth of Mr. Burges' remarks with regard to the winning dogs from Mr. Llewellin's kennel, it appears to us that in common with others who take up the cudgels as partisans in behalf of that gentleman's strain of dogs, that he entirely overlooks the fact that it was the Laverack cross with the Duke-Rhoebe strain which produced the winners. That is to say, does he believe that dogs of equal excellence would have been produced except through the medium of this cross?—ED.

THE USE OF CANTHARIDES.—A correspondent writes from Bridgeport that he has had a sad and costly experiment in the use of cantharides as advocated by "Dinks." Our correspondent appears to have exceeded the dose mentioned in the book. We do not believe that the quantity would of itself have killed the dog; there must have been some additional agency at work. However, we do not believe in forcing nature, and would never advise such a course. When asked the question, we merely consulted "Dinks."

EDITOR FOREST AND STREAM.

Having read "Dinks'" prescription, viz.: seven drops tincture cantharides twice a day until the effect is produced—probably six days—and having a pointer bitch which ought to have been in heat last February, from which I was desirous to raise a litter, I resorted to the above deadly poison. Monday morning, April 2d, I gave her eight drops, mixing the same with her breakfast; evening of the same day same quantity, and continued giving her eight drops twice a day to Saturday morning, the 7th inst., making just five days. On Saturday, at 3:30 P. M., I let her out to have a run. At 4 o'clock I left my house for a few hours. Returning two and one-half hours later I found her in spasms, lying on her side, with her limbs stiff, head and neck elevated and stiff, eyes open, and looking natural. I commenced rubbing her with my hand, and soon discovered that when I rubbed her belly it seemed to ease her pain. In a few minutes she was apparently all over it. Having a high pulse and body very hot, I took her out of doors, thinking fresh air might benefit her. In about twenty minutes more she was again in spasms. Taking her into my arms I carried her into the house, and laid her on my own bed. In a few minutes she was easier, and commenced to lick my hand while I rubbed her belly. I came to the conclusion that she had been poisoned with strychnine (as many dogs have died in this town during the past few weeks said to have been poisoned). I took her from my bed and laid her on the floor; then gave her an antidote containing one teaspoonful of ground mustard and one of table-salt, in a tumbler of cold water, producing no vomiting. Ten minutes after the antidote she went into her last spasms, dying in great agony. This is the first dog that I ever lost, and I assure the readers of the FOREST AND STREAM that this is my first and last experiment in assisting nature with the aid of tincture cantharides.

Yours, truly, S. S. PEASE.

—Mr. F. B. Farnsworth of Paris, Ontario, writes us under date of April 15, 1877, that he has just purchased and added to his kennel the imported Field Trial setter bitch Livy, imported from Mr. Llewellin's kennel, and from his great stud dog Dan out of his Lill II. Livy is a blue-belton in color, and own sister to the famous Field Trial winners Leda and Laura, also to Mr. L. H. Smith's Leicester. She should be in season about the 28th of the present month, and it is now his intention to have her warded at that time by his imported Laverack dog Carlowitz, or by Burges' Rob Roy. Carlowitz has received his visits recently from the following bitches: Captain Littleton's (of Detroit), Patsy; William A. Hopson's (of Detroit), Fanny; and J. H. Caniff's (of Detroit), Maud.

THE PEDIGREE OF COLBURN'S DASH.

NEW YORK, April 9, 1877.

EDITOR FOREST AND STREAM.

Some few weeks since, at your request, I gave you the pedigree of Mr. Geo. C. Colburn's Dash. In giving his pedigree it was necessary to allude to the late Dr. Paul Mead's Dash, he being his grandsire. In your last issue a correspondent signing himself G. takes exceptions, and says that I am in error, to which assertion I beg to differ with him. Now, Messrs. Editors, I will give you my authority for stating what I did. Some four years ago, while in company with the Field Editor of one of your contemporaries, we called on Mr. Andrew Johnson, then residing in Houston street, and in course of conversation Dash was mentioned, when he gave us his full history, and here it is: Mr. Andrew Johnson having a red setter bitch coming in season, he was desirous of having her warded by as fine an Irish setter as he could procure. Hearing that a British officer, stationed in Canada with his regiment, had brought over with him a brace of Irish setters, and was at that time visiting a friend in Albany with one of the dogs, he requested his friend Mr. Kent, who had accompanied him on his numerous shooting trips, and also had broken some of his dogs, to take the said bitch to Albany, which he did, and there she was warded by the British officer's dog, whose name was Dash. Mr. Kent having the bitch in his possession, and known as the Kent bitch, although Mr. Johnson was her rightful owner, was my reason for calling her the Kent bitch. In due course of time she whelped, one of the progeny being Dash, the dog in question. When he arrived at a suitable age, he was offered to Mr. Henry Marshall, of this city, who requested a trial before purchasing. The trial took place in New Jersey, on snipe, but not proving satisfactory to Mr. M., he declined taking him. He was then purchased by the late Dr. Paul Mead, of Brooklyn, the consideration being a sum of money and some merchandise. Mr. Johnson, hearing that Dr. Mead was so elated over his purchase, proceeded, or was about to proceed, to Brooklyn for the purpose of repurchasing, when he learned the Doctor had sold him to Mr. Benj. DeForest for $200, and who in turn sold him to Mr. Francis H. Palmer, in whose possession he died. The above statement came from Mr. Andrew Johnson, who could and would verify it; but he is no more, having departed this life during the past winter at his country seat, Barnegat, N. J. But there are others who knew Dash well as regards his breeding and his qualities in the field, among whom I may mention Mr. Robert Robinson, of Brooklyn; Mr. Stephen Putnam and Henry Marshall, of New York; Mr. Davis, a relative, I believe, of Mr. Johnson, and to these gentlemen I would respectfully refer your correspondent. I would also state that the *reddish red* that your correspondent refers to was a typographical error, and was intended for *Irish red*. As regards the above bitch, as she was known as the Kent bitch, in all probability she will continue being called such; and the same can apply to Dr. Paul Mead's Dash, although bred and owned by Mr. Andrew Johnson. A great many persons are not aware of the fact, and if they are they still continue calling him Paul Mead's Dash, notwithstanding he was owned subsequently by Messrs. DeForest and Palmer. F. B. RYEN.

THE CAUSE OF SHYNESS, ETC.

NEW HAVEN, Conn., April 21, 1877.

EDITOR FOREST AND STREAM.

In the last issue of your valuable paper I noticed an explanation, "The Cause of Gun Shyness in Dogs." If you find it worthy to publish my opinion after forty years' experience with all kinds of sporting dogs, the following is a true account of it:

Greyhounds, after the fourth generation in their own family, become sickly and nerveless, and of no more use to the sporting man. Pointers and setters, after the fifth generation in their own family, are worth nothing, as they become idiots, shy, and are unhealthy. Hounds never after the sixth generation, as above. All progeny from three-year old dogs and fourteen months sluts are the best. No dog after nine years should be used for stud purposes; no slut after eight. Fine English breeds of every kind of sporting dogs mature—the male at three, the female at two years of age, and in the third generation must be changed in blood, otherwise the dogs will be good for nothing.

As good blood makes good quality in my experience, good treatment and good handling of a dog makes the best of him, and sometimes I think it is a great pity that many of the noble and gentle animals must suffer in the brutal hands of a stupid owner.

Yours, very respectfully, BACKWOODSMAN

PLUNKET AND HIS GET.

EDITOR FOREST AND STREAM.

I notice in your article on the "Irish Setter," quoted from "Stonehenge," a mistake, not in the quotation alone, but in the original article as it appeared in the *Field*, which please allow me to correct. "Stonehenge" says Mr. Llewellin bred by Plunket "several average dogs, one of Kate (of the Knight of Kerry's strain), including Kilno, Kite and Kitty, while another litter out of Buckell's Min contained Marvel, May and Knowing, etc." * * * This latter is an error, for Knowing was by Plunket out of Kate and *not* out of Min. I take the liberty of noticing this since Kitty was imported by me in whelp to her own brother Knowing. Respectfully, MONT CLARE.

Sea and River Fishing.

FISH IN SEASON IN MAY.

Trout, *Salmo fontinalis.*	Salmon Trout, *Salmo confinis.*
Salmon, *Salmo salar,*	Shad, *Alosa.*
Grayling, *Thymallus tricolor*	Land-locked Salmon, *Salmo gloueri.*

FLIES IN SEASON IN MAY.

Black May, No. 10.—Body, black; feet, black; wings, grayish hyaline.

Cow Dung, No. 10 *and* 11.—Body and feet, brownish yellow; wings, yellow-gray.

Great Dun, No. 9 *and* 8.—Body, purple brown; feet, gray brown; wings, dark gray hyaline; setæ, dark brown annulated with gray.

Red Spinner, No. 10 *and* 9.—Body, bright claret, ribbed with gold tinsel; feet, brick color; wings, gray hyaline; setæ, pale brick color.

Yellow May, No. 10.—Body and feet, pale yellow; wings, pale yellow, mottled with brown; setæ, yellow.

Coachman.—Body, peacock herl; feet, dark red hackle; wings white.

King of the Water.—Same as queen of the water, with scarlet body instead of orange.

Gold Spinner.—Body, orange, ribbed with gold tinsel; feet, pale red hackle; wings, bright gray.

Captain.—Body, posterior half, peacock herl, anterior half, gray; white feet; red hackle; wings, gray; setæ, scarlet green and wood duck feathers mixed.

Soldier.—Body, crimson; feet, red hackle; wings, gray.

Kingdom.—Body, white, ringed with green; feet, peacock herl, and red hackle; wings, gray, mottled with brown.

Black Palmer, Brown Palmer, Red Palmer and *Gray Palmer*, are made respectively of the different colored hackles that distinguish them.

FISH IN MARKET.—The catch of shad in the North River during the past week has been very fair, but the same cannot be said of the Connecticut, when fisherman are not making a dollar per day. Our quotations are as follows: Striped bass, 20 to 25 cents per pound; smelts, 20 cents; salmon (frozen), 50 cents; Kennebec, 75 cents; shad (southern), 30 cents each; native, do. 46 cents; Connecticut River, 75 cents; white perch, 15 cents per pound; Spanish mackerel, 50 cents; green turtle, 18 cents; terrapin, $15 per dozen; frostfish, 8 cents per pound; halibut 15 cents; haddock, 6 cents; codfish, 8 cents; blackfish, 15 cents; herrings, 5 cents; flounders, 8 cents; sea bass, 20 cents; eels, 18 cents; lobsters, 10 cents; scollops, $1.50 per gallon; whitefish, 15 cents per pound; pickerel, 15 cents; salmon trout 18 cents; Long Island trout, $1; Canada do. 50 cents; hard shell crabs, $3.50 per 100; red snappers, 18 cents.

LAND-LOCKED SALMON.—We have received a fine Sebec Lake salmon from Mr. Frank M. Ford, of Sebec, Maine, a gentleman much interested in sport, and part owner of the little steamer "Rippling Wave," that plies on the lake. This salmon is the first of the season, and a very welcome friend at our table.

Mr. Ford writes that he will take special interest in promoting the comfort and pleasure of sportsmen the coming season. The hotel will be well kept by Mr. H. B. Wing, late of the Dewitt House, Lewiston, Maine, and will be remodeled and enlarged. Teams will connect with the Bangor and Pisquntaquis Railroad, four and a half miles distant. It is probable also that one of the safety steam yachts advertised in our paper will be purchased. There is a Newport-rigged sail-boat and several large river boats on the lake. The prospect for fishing is better this season than for a long time.

—The ice has broken up in the lakes of Maine and New Brunswick. Land-locked salmon are now biting. Trouting is reported good in Wisconsin.

—The St. John's, N. F., correspondent of the Montreal, *Globe* says twenty-three sailing steamers have started for the ice-fields, carrying about 4,000 men. In addition to these thirty-six sailing vessels have taken their departure from the various ports of the island, carrying about 2,053 men.

MOVEMENTS OF THE FISHING FLEET.—The Southern mackerel fleet are now well under way, some seventy-five vessels being engaged in fitting away, and a number have already started. By the last of next month the fleet will number about one hundred sail, and the mackerel fishery will be vigorously prosecuted. This business is attended by a large expense, the seines and outfits being costly, and can only be profitable through a large catch.

Some twenty sail of Gloucester Georgesmen were at Edgartown last Saturday, awaiting bait. On Monday bait was reported coming in lively.

The summer herring business is comparatively a new incident of our fishing industry, but the demand for shipment gives promise of its profitable pursuit. Three vessels have cleared hence for Newfoundland within the past week.

The number of fishing arrivals reported at this port the past week has been 5 from the Banks and 33 from Georges. The receipts have been about 462,000 lbs. split codfish and 465,000 lbs. halibut.

The fish market for the week shows a break in the prices of Georges codfish, the movements for the past few days being mainly at $4¼ per qtl., with a few transactions slightly under. Bank cod are in light stock, and moving slowly at $4 to $4¼ per qtl. In other departments of dry and pickled fish, business is quiet and prices mostly nominal. Fresh halibut are in moderate supply, with last sales at 5 and 4 cts. per lb., and shore fish at 2½ cts. for cod and 1½ for haddock. The shipments of boneless fish remain large, with quite a margin in prices, ranging from 4½ cts. for mixed fish to 8 cts. for prime Georges cod short cut and patent pack. Mackerel are out of the market except in jobbing lots, which are held at $25 per bbl. for mess, $15 to $22 for 1's, and $9 for extra 2's.—*Cape Ann Advertiser, April 20.*

WISCONSIN.—*Menasha, Wis., April 14th.*—This is a great country for fish, situated as it is at the outlet of Lake Winnebago, which is well stocked with pickerel, wall-eyed pike, rock, black and white bass, yellow perch, catfish, bullheads, Buffalo fish, muskalonge, some weighing as high as 45 pounds, 12 to 24 pounds not being uncommon; also rock-sturgeon, which are speared in large numbers through the ice all winter, besides several other varieties not mentioned. Three years ago 50,000 shad-fry were put into a small lake, connecting, and last year quite a number were taken with a hook and common angle-worm, from two to three pounds weight. Eels, 4,000 of which were planted at same time, very little heard from. I have known fifty black bass, three to four pounds each, taken in two hours by two fishermen with poles and live minnows. They also rise well to a fly. Hotel accommodations are good and cheap. Game quite plenty near. This is getting to be a favorite locality for sportsmen from Milwaukee, Chicago, St. Louis, and other places. S. L. H.

TROUT-FISHING IN NEVADA.—Those of our people who go to the Truckee River trout-fishing will do well to be careful about their bait, if they wish to have any success. The only bait with which they can succeed at this season of the year is a worm that is found in the greasewood. This worm cuts a ring around the main stalk of the greasewood, and is easily found by observing that the tops of the greasewood bushes are dead. The trout will bite at these worms when they will touch no other kind of bait. The Piutes and a few old settlers know how to find this peculiar bait, and are successful fishermen when all others fail. The dead leaves on the tops of the greasewood bushes show where the worms are, and all that is necessary to be done is to kick over the bushes to find the bait, as the shrubs break off at the point where the worms have ringed them.—*Nevada Transcript.*

—*Land and Water* (Eng.) relates the following concerning a remarkable battle, lasting for sixteen hours, between a plucky sportsman and an obdurate salmon, before the latter was conquered: "On Friday at four P. M., Mr. A. Crawshay hooked a fish below Haughton Castle, but did not land him till Saturday morning, the 24th inst., at eight A. M. Immediately after being hooked the fish went down the river taking out upward of 100 yards of line. The water being strong and the fish determined, it was impossible to get him back. A wood by the water side made it equally impossible for Mr. Cawshay to follow his fish, and so things remained until a boat was brought at daylight next morning from some distance, by which means the wood was passed, and the fish at last landed on a gravel bed, in the presence of many spectators, some of whom had passed the night with the angler. The fish was a splendid male, forty inches long, and twenty-two inches girth; weight, twenty-five and a half pounds."

It would seem that in this case the endurance was about equally divided. And it was not so much the actual weight of the fish, and its unusual size in that river, as the want of skill in the fisherman in handling a salmon of that size. In Maine and various parts of the Dominion they are accustomed to much heavier weights than this; but they are prepared for them, and being usually far superior anglers to the English, manage in an hour or two to capture the most belligerent salmon.

BLACK BASS FISHING IN THE RESERVOIRS.

WASHINGTON, D C., April 14, 1877.

EDITOR FOREST AND STREAM.

Connected with the aqueduct which supplies the cities of Washington and Georgetown with Potomac water, are two immense reservoirs, one of which is known as the receiving reservoir, and the other as the distributing reservoir. The first is used for the storage of water to supply the city in case of a freshet in the river, or when the water continues muddy for any length of time; and the other, located at the head of the pipe line, supplies the various mains leading to the two cities. Both of these reservoirs are filled with black bass and it is in regard to the rare sport which they afford that I hope to interest the many readers o FOREST AND STREAM. The aqueduct, which is one of the finest works of the kind in the country, was constructed by the National Government at a cost of nearly $4,000,000 The fountain head of the water supply is at the Great Falls of the Potomac, sixteen miles from Washington, and from this point a brick conduit, nine feet in diameter, brings the water a distance of about ten miles to the receiving reservoir where it leads into Dalecarlia Tunnel, which connects the conduit above with the conduit below the reservoir, so the daily supply of water can be drawn directly from the Potomac or the reservoir. From the receiving to the distributing reservoir, a distance of two miles, the conduit is of the same size as above, and extends around the latter so as to connect with the iron mains leading to the city, and empties the supply into them in case the river is clear; but when the water is all muddy on account of rains, the reservoirs furnish the daily supply, which now averages about twenty-five million gallons, though it can be doubled with additional mains leading to the city from the distributing reservoir, a distance of about two miles. The receiving reservoir was first completed and filled with water. It has been in use about fifteen years, and during that time the bass have increased and multiplied therein with great rapidity, besides the supply is annually increased by the young ones, which come down the conduit from the Falls, and easily get through the wire screens into the reservoir on account of their diminutive size. Many now in the waters of the reservoir have been there twelve or fourteen years, and in that time have attained a weight of from four to five pounds. The largest bass I ever knew to be taken in this locality weighed five pounds and ten ounces. It was captured early one morning in the reservoir, and fought bravely before he was landed. This reservoir covers an area of forty four acres, and varies in depth from two to fifty feet. The presence of fish in the reservoirs was long a disputed question, but I believe it is now generally admitted that they are beneficial to the water as they feed upon the animalculæ, and to a great extent clear it of insects and vegetable matter, washed therein by rains from the surrounding hills, which are cultivated. Some years since it was noticed in the spring that the water had a fetid taste and smell, and it was then argued that its offensiveness proceeded from fish in a state of decomposition in the reservoirs or pipes leading to the city. Other water-works in different parts of the country had the same trouble, and the subject was scientifically investigated. The generally received opinion now is, that it arises from the converve, which, under favorable circumstances, are generated in all reservoirs.

The bait used for bass in these waters is live minnows, frogs, and crawfish. They never rise to a fly in the still water of the reservoirs, though they often take it in the Potomac in places where rocks abound, forming rapids and eddies. The bass undoubtedly spawn in the reservoirs, and for that purpose seek the headwaters in the spring, where it is not so deep. As warm weather approaches they return to the deep water. I have frequently taken them weighing from two to three pounds, and when a bass of that size is hooked in water fifteen or twenty feet deep, with no rocks, grass, or snags to catch the line, he affords delightful sport. Their favorite feeding time is early morning. I have known of instances where eight or ten fine ones have been captured from sunrise to eight or nine o'clock, and after that time no bait, however attractive, could draw them to the hook. Trolling for them with minnow for bait is often very successful in these reservoirs, especially in August and September. A permit from the aqueduct authorities is necessary to enjoy the privilege of fishing in these waters, but the courteous officers having charge of the work never refuse such permission to gentlemen whom they know will not abuse the privilege.

FISHING IN ALABAMA WATERS.

EDITOR FOREST AND STREAM.

The letter of Dr. Lupton, in which he gave an account of the strange habits of the catfish caught in Berwick's Bay, has called up many recollections of pleasant days spent in that, for a sportsman, delightful locality. In the latter part of July, 1869, I received an invitation to pass some time with friends who were spending the summer on Fish River with the hospitable gentleman of whom Dr. Lupton wrote. Packing my traps, I boarded the first train that passed, and after a sweltering night arrived in Mobile. Late in the afternoon I took one of the little steamers which ply regularly morning and evening between the city and points on the bay shore, for the benefit of business men who prefer to spend their nights "over the bay," and soon arrived at Battle's Wharf, where I disembarked, and found Dick, a bright mulatto, in attendance with a light wagon. In this myself and baggage were soon snugly ensconced, and off we started on our nine miles' drive to the river, reaching the ferry late at night. Next morning I was up before the sun, and after enjoying a plunge into the briny waters brought up by the rising tide, I sought the landing to see how we were provided with boats. Here I found a large sail-boat, a smaller one with centre-board and sprit-sail, several row-boats, and a beautiful little skiff, the property of Mrs. W., just the thing for exploring the waters by oneself. Here the angler can enjoy the advantages of both fresh and salt water fishing, in the river and its numerous tributary creeks and branches are multitudes of perch, and a species of bass, called by the natives fresh-water trout.

Berwick's Bay is only a mile below the mill, and in its waters are salt-water trout, red-fish, croakers, sheepshead, and mullets by the myriad. These latter cannot be caught with a hook; but are easily caught with nets, and are used for bait. Minnows are not to be had, and cut mullet is used almost exclusively. Only once during my stay did we have a minnow, and this was voted to the Doctor, an old and enthusiastic angler. We accompanied him to see the sport. We went by boat to the mouth of a branch where the largest "trout" were wont to lie hid. After waiting a few moments—as the Doctor explained, for the large fish which the boat had frightened off to return—a cast was made. A rush, succeeded by a plunge, followed, and a large fish was securely hooked. After many unavailing struggles a six-pound beauty was wearied out and safely lifted over the gunwale. Another of about the same weight was captured with the same bait. The only drawback to our fishing was the presence of the gars.

Berwick's Bay, or Wick's Bay as it is called by the natives, is simply a lake-like expansion of Fish River, where it forms an elliptical basin some three miles long and two miles broad before its *embrochure* into Mobile Bay. Where its waters mingle with those of the bay it is not more than two hundred yards wide, and at this place is a bar, which is a fine place for seining. Along the shores of the bay are several houses, built after the Creole style, with large overhanging roofs and encircling piazzas. There, standing amid moss-covered live oaks, magnolias with their dark leaves and creamy flowers, and the luxuriant fig trees, rank foliage and purple fruit, form a scene most attractive to all lovers of nature. The fishing in the bay is at times very exciting, and at all seasons plenty of game and edible fish reward the angler's care. The gars, too, do not annoy one quite as much here as in the river. Apropos of gars, one of our party, disgusted by the number of hooks they had cost him, and the way they had contributed to his annoyance, determined to catch at least one specimen upon which to wreak his vengeance. On a visit to Mobile he secured a large hook, and had it fastened to a light chain about two feet in length. This he attached to a long line about as thick as a bed-cord, baited his hook with a large perch, tied the line securely to the bath-house railing, and heaved the bait overboard. In a few moments his patience was rewarded by a sharp tug at the line, and after a long struggle he succeeded in capturing—not the gar, but a young shark about four feet in length. This was all very well; but not the fish that he wanted; so he refreshed himself with a glass of ale, smoked a pipe, and spitting on his bait, again committed it to the briny deep. Soon there was a mighty strike, and a quick jerk fastened the hook securely. Then followed a long and most exciting struggle, which ended by the gar's being drawn to the surface and receiving his *coup de grace* from a pistol shot. He was an ugly customer, five feet and a half in length and thick in proportion, while the hooks found in his jaws told us that at least one of the wretches that had troubled us so long would annoy us no more.

Should any of your numerous readers ever feel inclined to explore the regions of which I have spoken, I can assure them that they can, in the proper season, find sport in plenty, both for rod and gun, and will never have cause to regret their visit to Berwick's Bay. WILL.

PORTER'S LAKE AND VICINITY.

PHILADELPHIA, April 20, 1877.

EDITOR FOREST AND STREAM.

Having read in the columns of your journal of a party making inquiry about Porter's Lake, I think I can give them the necessary information, having a regular visitor to that place for a number of years.

The quickest and best way for them to go from our city is to take the cars from the Kensington Depot and go to Stroudsburg. An excursion ticket to that place will cost $4.85. They can get a wagon at Stroudsburg from W. K. Henry, who keeps a livery stable, and will take them to the Lake for $6. It will take about six hours ride to get there, or, if they write to the proprietor of the hotel, Adam Rinehart, he will send his team to meet them.

As regards the fish in the lake, they will find pickerel, catfish and perch. The black bass were only put in the lake in August, 1874, by Howard J. Reeder, one of the Fish Commissioners of our State. I happened to be at the lake at the time he was there. There were only about fifty small ones put in (the lake), the balance having died before they got there. They will find plenty of trout streams in the neighborhood, particularly the Bushkill Creek, made famous by the late Mr. Thad. Norris's frequent reference to it in his "Angling in American Waters." They will also find good trout fishing in the Sawkill Creek, Middle Branch and Indian Calvin Branch (branches of the Bushkill), which streams are all within a short distance of Porter's Lake, and it will afford good sport fishing these streams for those who know how.

I do not think they will find a satisfactory place to camp on the borders of the lake; can get good board at the hotel for $7 per week, which will entitle them to the use of the boats, whereas should they camp out and have no boats, it is very doubtful if they can catch any large fish, for they are only to be caught at certain places in the lake, which can only be fished from a boat. My advice as a frequent visitor to the lake, is to make their headquarters at the hotel, where they will find nice clean beds and good square meals, and they will also find Ad. a good fellow, who does all he can to make his guests comfortable.

If they have made up their minds to camp out, I would advise them to go to what we call the "High Knob," which is about nine miles from Porter's Lake. You take the same cars and get off at Oakland, and procure a team to take you to the "Knob." I can recommend the black bass fishing at the "Knob." A party of us caught eighty-seven large ones in a day, which I consider good luck, considering that some of them weighed four pounds. There was a party who left the day before we came with one hundred and thirty-three, having caught them from Monday at noon to Tuesday at noon. My advice to any person in search of black bass fishing is to try the "High Knob," but take a boat with you. Respectfully yours, etc., EVAN RUSSELL.

GAME AND FISH OF GREEN RIVER, KY.

ASHBYSBURG, Ky., April 20th.

EDITOR FOREST AND STREAM.

I live on the famous stream of Green River, Kentucky; that is, once famous for its fish and the game that roamed at will in the dense canebrakes and swamps lying along its banks, but which now are nearly exterminated. The nets and stops worked the ruin of the finny tribe, while the fast increase of civilization drove the deer farther West. Green River is from eighty to one hundred and twenty-five yards in width, and from twenty-five to one hundred feet deep from the mouth to Calhoun, distant seventy miles. Lock and Dam No. 2 is situated at Calhoun, and in May and June one can have tolerably fair sport catching bass below the falls. But of all the fish famous in the waters of this river is the catfish; they grow to immense size, and as they suffer less from the nets than other fish they are still tolerably plenty. The water is too sluggish for trout this far down, as the locks keep the water dead in the summer and fall.

As to game, I will say we are hard to beat on squirrels, as the flats here abound in oak and hickory, and furnish abundant food for the bushy tail. Squirrels are now in splendid condition for shooting, as the young ones are good size and very fat. I killed sixteen in about three hours one day, and could have killed more. We have some turkeys, and they have been gobbling for some time; they commenced at least a month earlier than common. Our new game law forbids killing turkeys in the gobbling season, but seems to do no good, as I heard ten guns the other morning by sun up. Young squirrels came at least a month sooner than usual, and I cannot account for it, as the spring is only an average one. I have not seen a deer for nearly two years, although I see a track occasionally. Quails and rabbits are plenty on the hills along the river, and would be abundant in a short time if some pains were taken to kill off some of the owls, hawks and *varmin s.* I have killed but one pheasant since I have lived here—five years—and have seen but one or two more. Woodcock are also rare. Ducks, once so numerous in the spring and fall, have become also very scarce, only a few stopping in their flight.

If any of your readers that see this want to go on a hunting expedition next fall in a place where game is plentiful, just give them my address. I want one or two good fellows to make a party of two or three, to go on a trapping expedition next fall and trap all winter. I promise good sport and a fair remuneration at a very small outlay.

PADDY O'LEARY.

Tiffany & Co., Silversmiths, Jewelers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their timing watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. Tiffany & Co., are also the agents in America for Messrs. Patek, Philippe & Co., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Bronzes and Artistic Pottery is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. BRADFORD & ANTHONY,

374 Washington Street,

BOSTON, MASS.,

Importers, Manufacturers and Dealers in

Offer their usual extensive assortment of STAPLE GOODS, and are introducing this season some NEW and DESIRABLE articles. We call attention to the

PATENT ADJUSTABLE FLOATS AND ADJUSTABLE SINKERS,

which can be attached and detached at will, without knotting or tying the line, or removing the bait or hook. Can also be moved readily on the line, and remain fixed wherever placed. These are rapidly taking the place of the old-fashioned floats and ringed sinkers.

SPLIT BAMBOO FLY RODS from $15 to $50 each.

We make a specialty of Artificial Flies. Our stock is unequalled in variety and extent, and unexcelled in quality.

BRADFORD & ANTHONY received the award of the U. S. Centennial Commission in 1876 for "Exhaustive Variety of Anglers' Apparatus, especially HOOKS, LINES, RODS, ARTIFICIAL FLIES, * * of the BEST QUALITY."

Our Illustrated Wholesale Catalogue of Fishing Tackle will be mailed to any dealer whose address is sent to us. 5aplt

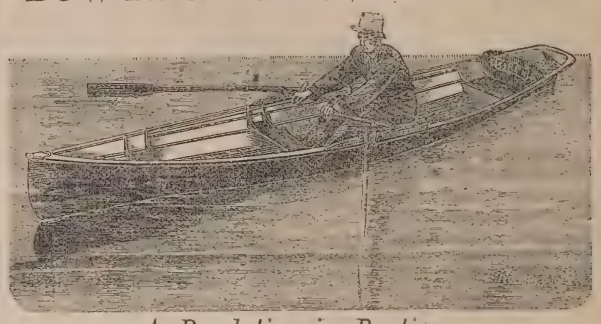
"ST. LOUIS CONICAL BASE PAPER SHELL."

Having made important improvements in our Shell, we can safely recommend them as equal, if not superior, in quality to any Paper Shell manufactured in this country or in Europe.



Among the advantages claimed for these Shells, are: A saving of 25 per cent. in the use of powder; also the great decrease in recoil. The sizes made are No. 10—2¼, 2⅝, and 3 inches; No. 12—2¼, 2½, and 2⅝ inches. Longer Shells will be made at extra cost. They are not mailable. Sample, 100, sent by express on receipt of $1.15 for No. 12; $1.30 for No. 10.

Factory and office, No. 2,230 De Kalb Street, St. Louis, Mo.

ST. LOUIS PAT. SHELL MANUF'G CO.

PAINTING.—**THE PATRONS' PAINT COMPANY** are manufacturing the *INGERSOLL READY-MIXED PAINTS*, and *BRUSHES*, and selling them at full trade discounts, delivering them freight paid, and no money required until the goods are received—making them cheaper than even the material can be bought elsewhere. They are an absolutely pure article, possessing great endurance and brilliancy, and are giving great satisfaction all over the country. We have a Patron friend who saved enough alone on Paint purchased to pay his Grange expenses for a life-time. They also sell *ROOF PAINT* 30 per cent. cheaper than any one else. It is to the interest of all about painting to write and have sent free their book, *"Every One His Own Painter."* It will save much money, whether you buy their Paint or not. Address, 259 FRONT STREET, NEW YORK.—*(From "The Farmers' Friend.")*

LYMAN'S PATENT BOW-FACING ROWING GEAR

A Revolution in Boating.

With this rowing gear the oarsman faces forward instead of backward, pulling in the same manner as with ordinary oars. The stroke is longer and much easier than with any other oar. The boatman makes no more effort in steering than in directing his course while walking. The oars can be shipped instantly by closing them upon the gunwale of boat or entirely detaching them. This oar is especially adapted to all kinds of pleasure boating, and is indispensible in duck shooting.

SONG OF BALT THE HUNTER.

THERE was an old hunter camped down by the kill,
Who fished in this water and shot on that hill;
The forest for him had no danger nor gloom,
For all that he wanted was plenty of room.
Says he, "The world's wide, there is room for us all,
Room enough in the greenwood, if not in the hall.
Room, boys, room, by the light of the moon,
For why shouldn't every man enjoy his own room?"

He wove his own mats, and his shanty was spread
With the skins he had dressed and stretched out overhead;
Fresh branches of hemlock made fragrant the floor
For his bed, as he sung when the daylight was o'er,
"The world's wide enough, there is room for us all—
Room enough in the greenwood if not in the hall.
Room, boys, room, by the light of the moon,
For why shouldn't every man enjoy his own room?"

That spring now half-choked by the dust of the road,
Through a grove of tall maples once limpidly flowed;
By the rock whence it bubbles his kettle was hung,
Which their sap often filled while the hunter he sung,
"The world's wide enough, there is room for us all—
Room enough in the greenwood if not in the hall.
Room, boys, room, by the light of the moon,
For why shouldn't every man enjoy his own room?"

And still sung the hunter, when one gloomy day
He saw in the forest what saddened his lay;
'Twas the rut which a heavy wheeled wagon had made,
Where the greensward grew thick on the broad forest glade.
"The world's wide enough, there is room for us all—
Room enough in the greenwood if not in the hall.
Room, boys, room, by the light of the moon,
For why shouldn't every man enjoy his own room?"

He whistled his dog, and says he, "We can't stay;
I must shoulder my rifle, up traps, and away."
Next day through those maples the settler's ax rung,
While slowly the hunter trudged off as he sung,
"The world's wide enough, there is room for us all—
Room enough in the greenwood if not in the hall.
Room, boys, room, by the light of the moon,
For why shouldn't every man enjoy his own room?"

For Forest and Stream.

Trout Fishing in Southwestern Colorado.

ABOUT the middle of last May, near sundown, as the winds blew cold off the mountains to the south of us, and a snow storm was raging apparently so near us as to make the party draw their blankets and overcoats more closely around them, Barlow and Sanderson's stage coach, drawn by six superb iron-grey horses, crossed the bridge which spans the north fork of the Arkansas, and drew up for the night in front of the stage stand kept by a Mr. Bayles—a gentleman who knows how to entertain travelers and does not care to rob them by exorbitant charges. The coach had that morning left the pleasant little town of Cañon City—which takes its name from its location at the mouth of the great Arkansas Cañon—and had toiled all day long up and down the steep roads among these wild and majestic mountains with only a short respite at dinner time for the eight weary passengers within. So you may imagine it was not an unpleasant thing to hear the driver say, as we stopped: "Alight, gentlemen, we stay here for the night."

I had not been much accustomed to mountain scenery, and had all day long been busy looking at and admiring the sublime and ever-changing panorama, but as I stepped out of the stage and took a survey from this retreat on the banks of the Arkansas, I could not avoid an expression of delight at the pleasing scene, and a doubt as to whether nature had provided many, if any, which excelled it. But it is not within the province of this letter to expatiate largely on the scenery of this country. Suffice it to say that old miners and habitues of the Rocky Mountains, who have spent their lives amid its peaks and eternal snows, claim that the part of them which lie in Southwestern Colorado—that newly discovered region of rich mines known as San Juan—are the loftiest, the grandest and the most glorious of them all; and I have no doubt of it.

As we stepped upon the portico of this mountain hotel, a fellow-passenger asked me if I would not try my hand with him at fishing. I had, just before leaving St. Louis, bought me a rude, cheap rod, and at Denver had laid in a meagre supply of flies, while, at Pueblo, a gentleman had presented me with a small troller. It was quite late to think of fishing, but as I never lag behind in this amusement, and as I had never caught a trout, much less seen one, I readily consented and we at once started off. Just below the hotel the south fork empties into the main or north fork, the former of which is spanned just above its mouth by a rustic foot bridge. To this point we directed our steps and crossed the tottering structure with eyes wide open and care directing our steps. On our way thither we met the agent who had charge of this section of the stage line and who made this his home. He had been trying his luck with the trout, and was returning without a single one. He assured us we had as well go back, we could do no good, the wary fish would rise for nothing, and seemed rather annoyed that we did not heed his advice. Having gone thus far, we thought it best to try it anyhow.

The waters of the north fork were what a greenhorn calls murky—that's my name for it; those of the south fork were clear as a crystal. I concluded to try my luck at the junction of the two streams and just below the mouth of the south fork. I had no idea of seeing the color of fish, however anxious I was to do so, but putting on my little spoon or troller, I, for the first time in my life, "whipped" the water for a "bite." The water came dashing down like a regular "mill tail," and my artificial bait was sometimes thrown clear above the surface, and kept up such a bobbing and bouncing on top of the waves I did not exactly see how a fish, ever so much inclined, could take hold of it. I did not have to wait long before I saw an active fellow miss it clear as a whistle. When he made his strike a receding wave allowed the spoon to suddenly sink, and he passed entirely over it. I had the buck ague in an instant. My rod quivered like a reed in a storm. I had seen my first trout and I wanted him—and I wanted him worse than I had ever wanted a fish before.

Directly, either the same fellow or another tried it, and this time with better success, as he got hooked and I got him out on the pebbly shore. I won't attempt to tell how I got him out. I don't know to this day how I got him out, but I presume, from the peals of laughter I caused my partner and another passenger who had walked up to see our luck, that I must have been very excited and very awkward about it. But here he was! My own, my first, my lovely fellow! I was proud of him. I was vain of the achievement. The old fishermen who had lived long in these mountains, who must of necessity know the habits of this fish, who had first abandoned an unsuccessful effort to entice him, and had warned *me* to abandon the chase, was, indeed, very much mistaken. He did not know it all by a long shot, and I should astonish the old gentleman on my return to the hotel. The "tender foot" and the greenhorn was too much for him. But I did not stop here; four more were taken before night, and a snow storm, which drove down the mountain into the valley, combined to force us to quit, with great reluctance, and seek shelter.

The old gentleman was indeed astonished when I threw down the five trout at the kitchen door, and, it appeared to me, a little chagrined that I had met with success where failure had attended upon him. My companion had simply baited with a piece of fresh beef and had not even had a strike, though he had "thrown in" all around and about me, and had invariably tried all the places from which I had captured my fish. Most of the fellow-passengers came out to look at the result of my first effort, and I stepped about with quite a consequential air and feeling. On putting up my rod and going into the house, the old gentleman was anxious to see my bait. I showed it to him, and he declared it wouldn't do; it was not the correct thing. I replied by saying that I thought the correct thing was the thing that would bring 'em, the thing at which they would generally strike, but he declared to the last one could do no good with such a trinket.

Long before dawn the following morning I crept quietly out of bed, slipped down stairs and out into the cold, bright starlight night, rigged my rod and soon stood shivering and with aching hands at my post of the former evening, trying to entice the wary fish. But they would not come. They were off their feed, or had during the night concluded to change their diet, for when at five o'clock the bell rang for breakfast I had taken but one lone fellow. My pride was somewhat humbled and I did not return to the hotel with any great flourish of trumpets. But the landlady had kindly remembered me, and had saved a nice fried trout, steaming hot, and when the stage horn blew, warning the passengers to mount, I was discussing the remains of my first catch.

Two days after this, over at Del Norte, in the San Luis valley, on the banks of the Rio Grande, I was introduced to a ranchman living about two miles from town, who was reported to be a great lover of fishing. Half upon his invitation and half upon my own, I walked out to his house to have a trial with him. He lived near the river, on a small creek that meandered and wound about through his ranch in a thousand crooks and turns, and occupied a conglomerate abode, part adobe, part logs, and part dried skins hung up at the openings for doors. He was somewhat Mormonish in his tastes, having two wives, Mexican women—mother and daughter—the latter a plump, round-faced and by no means unattractive woman. These he at once set off to catch some minnows for bait, while he and I walked off down to the river. Learning that I was on my way to the mines with a view to making a purchase if the outlook suited me, and having some interests there for sale himself, he at once became greatly interested in me, but not to that extent to flatter my vanity by allowing me to beat him taking fish. No, sir; if there is any one thing which a fisherman won't do, if he can help it, it is to allow another to beat him on the score.

My luck forsook me. The waters of the Rio Grande were not congenial to me. My star was not out. The old fellow skunked me. I watched him closely. I run my minnow on my hook, as a boy runs on a worm, as he did; I fished deep down with a heavy sinker, as he did; I appeared indifferent whether I got a bite or not, as he did; and, finally, when at last I got a nibble, I gave a tremendous jerk that would have thrown the intruder whirring through the air the length of my rod and line and nearly burst him open upon the sward forty feet away, as he did, when I was mortified by the loud peals of laughter, at my awkwardness, coming from the two Mexican women, who sat crouching upon the ground near by looking on. I don't think I should have been troubled over the merriment of the old one, but I really could not get over being laughed at by the young one. It worries me to this hour.

But the season was hardly far enough advanced. The fish had not come up in any great numbers. Besides, the water was not at that time clear enough for trout to rise to the fly. Later, say about the middle of June, is the best time for fishing in the main river. At this time I passed on up the Rio Grande to its source and tried my hand several times without any success whatever. If others had not had the same experience I should have suspected after Johnson floored me that perhaps the fault were mine. But no one caught fish as we went into the mines.

Passing over the Sierra Madre, I dropped in at the little mining town of Howardsville, on the Animas River, one of the most northern tributaries of the Colorado. Later I moved four miles further up the Animas to Eureka, and within some five miles of the source of the Animas, which rises in one of those silver-laden mountains some twelve or thirteen thousand feet above tide. There are no trout in the Animas. Two reasons are given for this—one that its waters are so impregnated with destructive mineral fish cannot exist in it; and the other that some great falls down near the line of New Mexico prevent their coming up. The former reason would be sufficient if the latter did not exist. At Silverton, the county seat of San Juan County, and near the southern boundary of the county, the water of the river is so strongly impregnated that it cannot be used, and the people of that town have to get their supply from a small mountain stream which they bring to them through an ordinary irrigating ditch.

About the 20th of June two of us packed a burro and journeyed over to San Miguel Lake, some twenty miles southwest of Silverton, not far from the line of Utah, and one of the tributaries of the San Miguel River. It was the hardest tramp of my life, and were I not writing about fish, and to a sporting paper, would make a separate letter and go into details. It may not be amiss to say that the trail was a miserable one, over a very rugged mountain, the snow line of which we unfortunately so timed ourselves to reach at noon, when the crust would bear neither man nor beast. We worried and tugged for two hours before reaching the summit—often all three of us nearly buried and floundering in the snow at once—disgusted and about exhausted. Jack had kept his temper first-rate and had all along responded to our aid in helping him out, but when we started down the mountain, and he fell through and stuck his nose, head and ears under the snow, he felt his dignity insulted, and he absolutely refused to go. So, to end the matter, we took off a wagon cover we had along for the purposes of a tent, spread it down doubled, threw Mr. Jack over on it on his side, and one taking hold of the sheet in front to pull, and the other hold of the now quiet fellow's tail to steer, we went down the mountain side at a good jog until we passed the snow line. Whether Jack had ever had a sleigh-ride before I cannot say, but he really seemed to enjoy that one.

The next morning at nine we were at a beauty of a lake, about a mile long and half mile wide, very deep and, it seemed to me, clear as water can become. Other parties had been before us—mostly miners, passing this way between the San Miguel gold placer mines and the quartz silver

mines on the Animas. We had met two who had spent four days at the lake, who warned us in advance not only of the great difficulty we would experience in crossing the range, but also of the fact that the trout were not "on" at the lake. We regretted often afterward we had not then turned back. We could see the fine fellows by hundreds under and about our raft as we drifted on the lake, but we tried every fly we had, tried grasshoppers, tried crickets, black and green, tried my Arkansas spoon, but after two days' honest work we summed up one two-pound trout, hooked in the belly while "fooling around" (which, by the way, fell through the raft and cleared out), and one half-pound trout, hooked squarely in the mouth. To say that we recrossed the mountain in extreme disgust but faintly conveys the idea—the idea cannot be conveyed. One must have the experience. But this time we tackled the mountain in the early morning before thawing had fairly set in, and crossed over with comparative ease. But it may be well to add that two days after our departure two friends of ours visited the lake and caught the finest trout in such abundance as to be actually surfeited. Another blow to my early vanity.

I left the Animas valley on the 16th day of July, in company with a Swede, to come out by a new and shorter trail. About two o'clock in the afternoon we were overtaken by a most terrible hail storm, which so completely buried our trail we lost it, became confused, wandered about till nightfall, struck fire on a mountain side under the shelter of some pines, staked out our beasts, tried to dry the clothes we had on and those in my valise, and at last lay down on the wet ground, with wet blankets, to be nearly inundated with a rain storm during the night. The next day we reached the head of Antelope Park, where Mr. Galloway and his most excellent lady entertain most excellently for that far-away country. Here I rested three days and again tried the trout. Galloway's is within a mile of the Rio Grande. A mile in that country appears as if only a few steps. I had Mrs. Galloway excuse her little boy from milking that evening and got him to go with me. At this date my recollection is that the little fellow beat me in numbers, while I beat him in weight. But neither one of us had much to brag of. The excessive rains had made the river muddy, and the fish did not rise readily to anything.

While fishing here I saw a party camped about a mile above. I had heard that some young men—the sons of Mr. H. B. Claflin, the big dry-goods merchant of your city—composed the party, and had been out some time hunting and fishing. From their constant firing I presume they did a large amount of practicing. But directly one of them, not a very robust young man, wearing spectacles, came down and apologized for asking me to tell him the day of the week. I replied that according to my reckoning it was Monday. He thought it was Sunday and seemed to have lost a day, though he had his rod and was growling at his poor luck. Two days later I saw the same party. They were breaking camp at the south fork of the Rio Grande, and were going down to Del Norte, en route to one of the parks. The same gentleman told me he had had fine sport in the south fork, it being clear and the trout rising to the fly and grasshopper with avidity. He assured me he had caught thirty in that many minutes. My passage having been paid there in a wagon and a stop-over check out of the question, I could not stop to test my skill. But I fell in love with the gentleman's rod, and if this falls under his notice and he is magnanimous enough to make me a present of it, and should inquire for my address, don't be "mealy mouthed" about giving it to him. I think I could catch fish with that rod in any water.

Before leaving Antelope Park, in company with an Englishman who owned the ranch at its head, I went over to Clear Creek, about two miles distant, and had some fine sport. We used grasshoppers altogether, catching them on our way over in the early morning while they were stiff with cold and could not fly far. An active grasshopper at noonday is rather hard to capture, even after you have knocked off both legs and one wing with a brush. The Englishman beat me, but not so badly that I cried about it. He was on his own territory, knew the ground, and I must confess he was not very lavish of any information extra beneficial to me. We killed near thirty, some of them weighing three pounds. And this was my last day's sport in Colorado.

It is safe to say the streams out there are full of trout. But they won't last long. In going along the roads one will see a willow pole or two protruding from nearly every wagon. A camp is hardly pitched near a stream before some member of the party is lashing it with his rude rigging for trout. But the erection of saw mills all over the country will exterminate the fish sooner than all other causes combined. Dams and sawdust play the deuce with trout. They can't stand it. They either leave the water or get choked to death.

Colorado is healthy almost beyond belief. Its scenery, and especially that in the territory I have spoken of, for variety, grandeur and sublimity, has no superior, perhaps, on this continent. The mines of San Juan promise the most fabulous results, and the tourist or seeker after health, who can submit to bear a little hardship and be deprived of some of the comforts of life, could hardly find a more attractive or more romantic trip than one to the country where head the Rio Grande, the Arkansas, and the Colorado Rivers.

B. H. P.

THE RANGELEY LAKE REGION.

BY THOMAS SEDGWICK STEELE.

(Continued from our last issue.)

RANGELEY, Maine.

MOOSELUCMAGUNTIC Lake, which affords such rare sport with the great Rangely brook trout, is about twelve miles long and four wide, surrounded by lovely, although I cannot say bold, mountains. From this lake looking to the southwest the White Mountains can be distinctly seen on a clear morning, but one of the loveliest of the whole number is West Kennebago Mountain, which lies to the north, and whose general shape reminds one of Mt. Washington as seen from the main street in Bethlehem, New Hampshire.

The building of the "Upper Dam," which lies between Mooselucmaguntic and Molechunkemunk Lakes (a place, by the way, of much resort by Bostonians), has caused a rise in the upper lake of about fifteen feet, and a peninsula at the mouth of Rangeley River which divides the Mooselucmaguntic from the Cupsuptuc Lake has been entirely overflowed, forming one large body of water, some eighteen miles in length, with only a few dead trees left to tell the story. Twelve miles from our camp, at the foot of Mooselucmaguntic Lake, is to be found the Rangeley Trout Hatching Association and the Oquossoc Angling Association. The camps are at the mouth of Bema stream, but the hatching house is some two miles above, and fine fishing at this time of the year can be found in this vicinity. They will deliver eggs of the trout from October 15th to February 1st, and young fry from February 1st to June 1st. They charge $5 per thousand for the eggs, $18 per thousand for young fry, half pound trout $25 per hundred, one pound trout $1 each, two pound trout $3 each, and larger fish according to size, and they insure safe delivery of eggs or fish. Their office is at No. 1302 Pennsylvania Avenue, Washington, D. C.

Professor Agassiz is authority for the statement "that no other waters in the world produce such large brook trout as these pure, cold streams in the wilderness of Maine," and they grew very rapidly in the first few years of their lives, but, of course, like man, do not continue in the same ratio. Many of them have been liberated after capture with weight and year stamped on a platina tag inserted in the dorsal fin, and Thomas Moran (the artist of the Yellowstone), who was of our party in June, 1873, captured a two and a quarter pound fish with one of these tags attached, stamped 1871, showing that the trout had increased one pound and three-quarters in two years.

At camp Kennebago there is a book in which a record of all large trout is kept, with dates, place and weight affixed, so that any time we can turn over its pages and note the heroes of the association. This book dates as far back as 1868, at which time, if I mistake not, the association was organized. A record was recently published of thirty trout which weighed 181¾ pounds in the aggregate.

Mr. Page, the president of the Rangeley Hatching Association, some seasons ago took with a fly on the Rangeley River a brook trout weighing ten pounds, and if the reader has any doubts of this statement, the next time he is in New York, if he will call on Mr. Page at No. 10 Warren Street (second floor), he will be permitted to examine the fish, now at rest under a glass shade.

One of our party last spring, Mr. R. G. Allerton, of New York City, took in two weeks 175 trout weighing 232 pounds, and among the lot were fish which turned the scales at three, four, five, six, six and a half and eight pounds. This gentleman, although a member of the association, has a camp some five miles down the lake, and near his camp is a large spring hole where he keeps all his fish alive during the entire time he is at camp.

To be the hero of landing a trout over four pounds is quite an object at this camp, and to recount the tale of its capture to the envious ears of your brother anglers a delight in which one never tires. It was the writer's good fortune to land one of these monster trout weighing six pounds, June 14th, 1873. Under the shadows of old Bald Mountain, which lies to the northeast of Lake Mooselucmaguntic I first felt that magic pull that went like an electric thrill to the ends of my fingers. I had been trolling with about one hundred and twenty-five feet of line, and had caught a few small trout from a half to one pound each, but had about decided that my last day at camp would be the poorest of all. You are apt to get a little careless when trolling for some time without success. In fact I was so interested in the landscape that I had just returned my book to my pocket, having made a rough, hasty outline-sketch of the White Mountains, which were in full view. Just then a trout struck and aroused me from my reverie. Before I had recovered from the first shock another followed, until I had no doubt of the quality of my game. Then all was quiet again, and wondering what had happened I gently reeled up a few feet of the line, my guide remarking that he thought I had lost him. But I very soon discovered that it was not so, but that his lordship had taken the matter into his own hands and was heading directly for the boat, thinking, as I suppose, that our shadow in the water was a lone rock under whose protection he might find rest. For a while it was about an even chance whether the line would be gathered on to my repeating reel as fast as the fish dropped the slack of it into the water, for it was with the greatest difficulty I could retain a consciousness of the fish. But finally, after a hundred feet of the line had been stowed away on the reel, and twenty-five feet only remained, the trout became motionless as a rock. Now came the time to see which should be master. Nervously I held him, expecting some new freak would start him the next moment, and I had not long to wait, for the next instant he shot like an arrow for under the boat.

"Quick! guide, quick!" I shouted, and with a sudden dip of the paddle we shot out into the lake, the trout coming up on the other side of us, but not in a way he most desired. Before I had recovered sufficiently from this movement he plunged for the bottom. I endeavored to check him by "giving him the butt," but it was of no use, for in less time than it has taken to tell it, I had lost fifty feet of line and he was not contented even with that. Slowly again I reeled him in, foot by foot, inch by inch, and drew him so near that I could see his entire length. Guide said "he would weigh hard on to four and a half pounds," but never having caught a trout weighing over two and a quarter pounds, I did not offer my opinion. Backward and forward I swayed the giant until four feet of my single gut leader showed itself above the water, and I could see the mottled sides of the trout, and in my anticipation he was as good as mine. With head down and his caudal appendage moving slowly backward and forward, he lay, stubborn and obstinate. My guide dropped a stone into the landing net to keep it in the right position, and slipped it overboard, but his majesty was not so fagged out as we had anticipated, for with another tug at the line he sought the bottom, doubling in this way again and again, one moment seeming to be mine and the next knocking over all my air castles by running fifty feet away. Finally, finding all efforts to get free were useless, he came again to the surface, and with a dexterous movement of the net he was safely landed in the boat. Quickly seizing my scales I held him up to my guide's admiring gaze. Immediately the indicator marked *six pounds*, and passing around his body a cord he measured fourteen inches at the dorsal fin and twenty-five and a half inches in length. Looking at my watch, just twenty-six minutes had been spent in his capture. As he lay there in the net still heaving with excitement, his sides spotted with gold and rubies, his gills distended, and his dark fins edged with snowy white, to say that I was happy would but tell half the story, for such an experience is but one of a life time.

These large trout are not quite so plenty as five years ago; still, you can perceive that they hold their average large size well. But it has been thought that, with their decrease, fish weighing from one to two pounds have greatly increased, and such is undoubtedly the case.

Large trout weighing from six to ten pounds will average from twenty-three to thirty inches in length, and the width of the tail is from five to eight inches.

They have all the beautiful spots, tints and recognized peculiarities of brook trout, such as square tails, small heads, the inside of the mouth black (instead of white like lake trout), and are no doubt the genuine *Salmo fontanalis*, as lake trout are not known in this locality. Some epicure will ask regarding the taste of these large trout in comparison with those under a pound in weight, and I would say that having tasted of two trout weighing six pounds each and one weighing seven pounds, I see but very little difference, that little being in favor of small trout.

These large trout are often very quiet and sulky soon after they strike the hook, and one is often deceived by thinking he has fastened to a log, but when once they move, they carry all before them. The "log drivers" and lumbermen in this vicinity fish in and out of season, and a moment's cessation of turning the windlass used in "booming out" the logs is devoted to this pastime, and it is for their restriction that the laws are to be rigidly enforced.

By the way, these "log drivers" are a queer set of fellows, and when paddling across the lakes in their shark-like bateaus (or "bats," as they call them), chanting their strange songs at evening, they look more like the inhabitants of another world than of this. In the spring large trout weighing over four pounds are caught by trolling, but at this time the fly has the preference. Our flies are very large, and would astonish almost all those who patronize the Adirondacks. Some of them are really salmon flies, and have plenty of red and yellow in their composition, but with a nine foot leader and an eight ounce rod we find no difficulty in managing them.

(To be continued).

For Forest and Stream.

WOODCOCK HUNTING IN CANADA.

ONE bright day early in October I met a congenial friend of the gun, and the conversation turning to woodcock hunting, I mentioned having lately heard of good shooting in Canada, and expressed a desire to try that ground. "Nothing easier," said my companion, "I have a Canadian friend to whom I will be glad to give you a letter of introduction. I cannot go myself, but have no doubt you will be well received and enjoy a good hunt, though I am a little dubious about the birds being as abundant as you imagine; still, you may find some in that vicinity."

So the next morning found me crossing the Suspension Bridge, and the same evening brought me to the door of a thrifty farmhouse, a few miles from St. Catherines. My host, a fine old gentleman, was glad to see me, and soon made me feel perfectly at home. In answer to my inquiries about woodcock, he said, to my delight, that "the woods were full of them;" and then asked, "but what do you do with them—you don't *eat* them, do you?" Here *was* native simplicity indeed. I hastened to enlighten the household, and descanted in such glowing terms about the glory of a properly cooked October woodcock that the whole family became quite interested, and its head declared that the next birds which the boys shot should certainly be cooked, and no more of them thrown away as worthless.

I retired to rest early, but not to sleep. For hours I was making splendid snap shots in all directions, and rejoicing in a well filled bag; but the sharp whistle of swift wings gradually grew fainter and fainter until, after making an unusually fine shot, all was lost in oblivion. At sunrise I was up, and after breakfast, having assured my hostess that she should that day sup on broiled woodcock, I left for the fields to begin my hunt.

I tried field after field without success, and carefully quartered the most favorable ground to no purpose. Not a bird was flushed. I began to grow anxious, and leaving the low ground betook myself to the woods, thinking that this erratic bird might perhaps be feeding there instead of in the open country. I thoroughly explored all the woods and fields within a radius of two miles without finding the object of my search. A few wild pigeons were seen and a solitary snipe was brought to bag. Only this, and nothing more. At high noon I stopped, hot, tired, and disgusted, with a well defined suspicion that either I was the victim of a practical joke, or that the truth was not in the Canadians. I returned to the house in no peaceful mood, but the calm and guileless countenance of my host which greeted my arrival, and his honest inquiry concerning my luck, soon dispelled my distrust. I answered that it was my firm conviction that there was not a woodcock in the Canadian Provinces. He seemed surprised, and offered to go with me after dinner, and promised to show me a dozen in less than an hour. He appeared so confident that I soon regained my spirits. Dinner dispatched, we were speedily on our way to the nearest woods, where the old gentleman declared he had seen several a few days before. We were just entering the timber when he stopped and said, "Hark! I hear one now." *Hear* a woodcock in October? Who ever did hear this most silent of birds make any sound out of the breeding season, except with its wings as it swiftly darted out of sight? Somewhat puzzled in regard to strange habits which appeared to be developed by a residence across the Niagara, I moved thoughtfully on, wondering what would turn up next. After going a few yards farther the old gentleman suddenly stopped, and pointing excitedly up in the trees, said "There he is, shoot him quick." In open-mouthed amazement I gazed in the direction indicated, and there, O shades of Audubon and Wilson! was a red-headed woodpecker, vigorously hammering at an old dead limb. "Ain't you going to shoot him?" said my guide. I managed to say that it was not a woodcock. Not a woodcock? Certainly it was. Did I suppose they do not know what a woodcock is in that country? Slowly and sadly I broke my gun, and as I replaced the shells in my pocket, I mildly replied that was not the kind of woodcock I was after, and turned toward the house. I quickly departed from that uncanny neighborhood, and when I again crossed Suspension Bridge I had added an item to my store of ornithological lore, although no woodcock to my bag.

I afterward learned that this was a common name for the red-headed woodpecker in that region.

W. L. C.

For Forest and Stream.

LAKE ST. PETER.

The traveler having occasion to follow the north shore of the River St. Lawrence, between Montreal and Three Rivers, crosses below the village of T'Machiche the river of that name, a muddy, insignificant looking stream at that point, dragging its slow length along to Lake St. Peter, distant a mile or so.

The parish of T'Machiche, through which the river flows, is one of the finest and richest in the Province, its soil in a great measure being formed of an alluvial deposit of marvelous fertility. The name T'Machiche sounds odd to those who are not accustomed to hear it used. It is of Indian origin, and signifies muddy river, or the river with the muddy bottom.

In the journals of the Jesuits the river is mentioned at two separate times and under different names. Father Bressany, a Jesuit, ascending the St. Lawrence in the year 1644, with a party of Huron Indians, wrecked his canoe about a league above Three Rivers. Fortunately it was during fine weather, and being near shore they saved the contents, but the accident retarded their progress and obliged them to camp over night, from which place they started in the morning; but owing to cold weather and a furious snow storm which prevailed, their progress was slow and they were unable to pass the river "Marguerie," where the Hurons, having fired at some wild geese, made their presence known to a band of Iroquois, who happened to be within hearing of the report of their guns, and who laid in ambush behind a point at the mouth of the river. In rounding the point Father Bressany found himself confronted by three canoes filled with Iroquois, at the sight of which he commanded his Hurons to lay down their arms and accept the situation, considering, no doubt, that under the circumstances discretion would be the better part of valor. The Iroquois seized the priest and his Hurons, made them prisoners and took them to their own country, where, contrary to their usual custom, their captors treated them well.

Even to this day Lake St. Peter is a famous resort spring and fall, in their migrations, for geese and ducks, of which latter there are a great many varieties; but until the arrival from the Lower St. Lawrence of the Canard d'automne, or fall duck, the black duck is to be found the most numerous, and capital shooting is to be had in the numerous bays of the lake. Ducks begin to leave their breeding among the swamps and lakes of the Laurentides about the middle of August, and from the first of September until the heavy autumn frosts good shooting can be had on either shore of the lake, but probably the best shooting is to be found among the Sorel Islands, at the head of the lake; such has been the writer's experience. The immense marsh lands bordering the lake afford good snipe and plover shooting; and no doubt the best woodcock grounds in the Province are to be found at the south shore, at La Baie. Thanks to the vigilance of the Fish and Game Protection Club of the Province of Quebec in enforcing the game laws, ducks are increasing rapidly in numbers, and if a stop was only put to spring shooting when the birds are on their way to their breeding grounds, the shooting would be as good as it was in days of yore.

Mais revenons à nos moutons. A few miles above the mouth of the T'Machiche we reach the beginning of the rapids, the river constantly gaining accessions on either side from fresh and saline springs. Within a short distance there are eight of these saline springs, and while making our way toward the source of the river among the Laurentian hills, *en passant*, let us stop a moment and examine the most important one of them, called Caxton, deriving its name from the township in which it is situated. It belongs to the class generally denominated saline, and characterized by containing a large quantity of salts of soda; in composition it somewhat resembles the Saratoga water. It contains a great quantity of carbonic acid gas, imparting to it an agreeable taste. Some remarkable cures of rheumatism and dyspepsia have resulted from the use of the water by the habitants. It has, however, only a local reputation; were it located among a more enterprising people, it would long since have become famous. The St. Leon Spring, seven miles west from Caxton, has lately been introduced to the American public, and as its virtues are becoming more favorably known, it is becoming more and more a place of resort; but few summer resorts possess better attraction, for the sportsman. A drive of six miles through a beautiful country brings one to the shores of Lake St. Peter, where, in the season, shooting and fishing can be indulged in to the heart's content. On the other hand, a few hours' drive through a romantic country lands one on the shores of the lakes of the Lanrentides, than which no better trout fishing can be found on the continent; and so following up the T'Machiche, a short distance above the spring, we come to the Dalles, where the water has worn for itself a channel through the limestone ledge, until it is not more than fifteen feet in width, and through this narrow groove the river rushes for some five hundred yards beyond the Dalles and to its source. The river is rapid, and unlike most of the rivers seeking an outlet through the Laurentian range, it possesses no high falls, although its source is some 1500 feet above the level of the St. Lawrence. But of the shooting and fishing to be had at the sources of the river and the surrounding country, more anon. JEAN.

Fish Culture.

THE RARITAN FROSTFISH.—This fish, more properly the smelt (*Osmerus mordax*), is not as highly prized as it might be, either for sport or for the table, although in Massachusetts they are angled for with much eagerness, as they grow to a foot in length and afford lively play for fine tackle. Whether the more northern smelt is identical with his congener of the New Jersey coast is a question that has been raised, although we think there are no specific points of difference. In a recent number of a Freehold paper (we have lost the name) Prof Lockwood has an interesting article on the subject, from which we quote the following:

"From time immemoriel the city of New Brunswick has been famous for the so-called frostfish caught in the Raritan River. This pretty little fish, one of the most highly and tenderly organized of all the finny tribe, has always been a spring bonne-bouche in the old families of this staid old city. The scientific name of this little favorite is *Osmerus mordax*. This pretty smelt is obtained in the Passaic, Delaware and Raritan Rivers. It is caught also in the Hudson, and notably in the Connecticut, where it attains a larger size than does the same in New Jersey, a fact which has led to the popular notion that they are not the same fish. But geographical range has very much to do with the matter of size and color. Now, of all the places where our little smelt breeds, for the quality of exquisite delicacy, in fact for gastronomic reputation, those of the Raritan River carry off the palm. It seems that a sister State has her desires set upon possessing this piscatorial dainty. For some days back the Maryland Fish Commission has had a station at the Albany Street bridge, New Brunswick. Some time ago a number of live smelts were taken from the Raritan and set free in a Maryland river. But the venture proved a failure. The fish were either destroyed, or, what is more likely, they went to sea and never returned The commission are now aiming to raise the fry, and with that they hope to stock the waters of Maryland. The fishermen bring the live smelts to the hatching-house, where they are taken in hand by the operator, who, holding the female fish by the neck with the thumb and finger of one hand, by a downward movement from the neck presses the roe or spawn out with the thumb and finger of the other hand. The eggs are made to fall into a receptacle. When this box is partly full the male fishes are treated in a like manner; their milt is caused to fall upon the living roe. This is gently stirred and all are thus fertilized. These fertile eggs are then set in very thin layers in hatching troughs of water. Ere this cold month of March is over, the operators hope to have on their hands many thousands of fry or young smelts. Tiny little chaps they are, and they will have to run their chances in the life race with a vengeance, for the ichthyic gastronomer, which in the rivers do congregate, are after them with appreciative and hungry maw. We shall be glad to hear that these little Jersey fishes are thriving in the waters of Maryland.

"Associated with the commission is Mr. Henry J. Rice, a fellow of the Johns Hopkins University, Baltimore. He is the embryologist, and with his microscope he is studying the changing of the embryonic form. He will make an effort also to determine what the real difference is betwen the northern smelt and that of New Jersey. When we saw him this week he had not yet succeeded in getting undoubted specimens from the New York fishermen of the northern variety."

CARE OF YOUNG TROUT.

OAKLAND, Bergen Co., N. J., April 21, 1877.

EDITOR FOREST AND STREAM.

It is thought by many fish culturists that it is a very hard matter to raise trout until they are six months old. We know that they are subject to many diseases; that they die with careful treatment as well as careless treatment; and thus far no one has given any rules whereby they can be brought to maturity with only a small percentage of loss. Livingston Stone comes nearest to it of any practical writer on this subject. We believe, with him, that it can be done, yet few have the requisite facilities to do it. For a few years I have been engaged in the culture of trout with both good and poor success, but whenever I failed could always find a good reason for the failure, and tried to avoid it in the next attempt, which could not be done perhaps until the next season. To start with, one must have the natural facilities, viz. a constant flow of pure water of uniform temperature, not liable to be flooded, and a good fall. Great care should be taken that you get your eggs from healthy fish, as many diseases (I think) of the fry are traceable to the parent fish. After you have your eggs placed in your hatching apparatus exclude the light, and do all you can to keep fungus from generating. After the eggs have been in the hatching troughs twenty days or more, take them out every day and wash them, and clean out the troughs, removing all the dead eggs. If you discover any fungus in your distributing trough and cannot turn off the water handily, sprinkle in plenty of salt and it will kill the fungus. As soon as your eggs are hatched remove the fish to another trough where you have spread a half-inch or an inch of good, clean, fresh earth, with a little salt mixed with it. As a general thing the fish will remain healthy until the sac is nearly absorbed, with the exception of a few that are attacked with blue swelling of the sac. Sometimes the fish will all remain healthy until after they have been feeding for a week or two; then, if they have not been properly attended to, a few will begin to die, the next day probably fifty or a hundred, and if no remedy is applied all will be dead in a week.

I have never had any disease attack my fish that a salt bath would not cure before they began to feed. To give them the salt bath, shut off the water from the trough or rearing box, and dip the water mostly out; then put in at least half a pint of salt to a gallon of water, and stir gently with a feather until the salt is dissolved. When you see the fish begin to turn on their sides let on the fresh water, and very soon they will be as lively as ever. If you have not given the fish fresh earth every day or two, a little white spot on their head will appear, which invariably kills the fish. This disease never appears when fresh earth is freely used. Again, while the fish seem well and eat well, you will notice a few lying on the bottom or swimming about slowly, dropping down on the bottom and turning on their sides. The next morning they are dead, with their gills full of fungus, which they have picked up while floating about. Salt is a sure remedy for this disease and does not kill the fish. Stone first recommended it in his "Domesticated Trout." A free use daily of rock salt in the distributing trough and aqueducts leading to your rearing-box is a preventative. When your fish are troubled in this way, take them out in a pan or dish and give them a strong salt bath, and see how soon the top of the water is covered with dead fungus from off the fish. The next morning you will find your fish lively, and no dead to pick out. I also find that a salt bath kills parasites and saves the fish, and when salt is used freely there are but few of the emaciated or sickly ones—all head, with body growing smaller every day. In some of my rearing-boxes, when the fish have been supplied with earth and salt freely, it is a rare thing to find a dead fish, and they are uniform in size, with no emaciated ones against the screens or seeking the still water in the corners, but all vigorously heading up-stream. From my experience and experiments I am fully convinced that any man who has a taste for fish culture, and has the requisite natural advantages, and will start with good eggs from healthy fish and a barrel of salt, backed up with energy and perseverance, and a determination not to neglect any duty, however trifling it may seem, can raise trout until they are six months old with ease. Overcoming previous failures is a sure road to success. B. B. PORTER.

CALIFORNIA SALMON SPAWN FOR HOME AND FOREIGN MARKETS.—Preparations are being made by the U. S. Fish Commission for another campaign on the McCloud River, California, for salmon eggs. Sufficient funds have been furnished by Hon. Spencer F. Baird, U. S. Commissioner of Fish and Fisheries, from the Congressional Appropriation, to enable Mr. Stone to take six or eight millions of eggs this season, if everything is favorable. Of these, the foreign demand, which is increasing every year, will probably absorb all not needed for home use.

Australia, New Zealand, Japan, Chili, Russia and France are among the applicants for California salmon eggs this year.

FISH CULTURE IN CANADA.—Rice Lake, in Canada, which lies about twelve miles back of Lake Ontario and is reached by railroad from Port Hope, has been set apart for the natural and artificial propagation of fish during the space of three years from the first day of May next, together with the River Trent down to the Bay of Quinte, and also that portion of the Otanobe River, extending from its inlet at the said Lake to Lock's Bridge, Peterboro', all within the Counties of Hastings, Northumberland and Peterboro', in the Province of Ontario.

These reserved waters are placed under the special charge of Charles Gilchrist, Esq., Fishery Overseer, Port Hope, to whom application for permission to fish must be made. Foreigners will be required to pay $1 per diem for angling permits. There are several penalties for fishing with other devices than hook and line.

LOBSTERS.—Some interesting experiments with lobsters are being tried at the Cold Spring Trout Ponds, Charlestown, New Hampshire, under the auspices of the California Fish Commission, to see if this delicious shell fish can be kept alive long enough, under the conditions imposed by railway travelling, to survive the journey to California, the introduction of lobsters into the Pacific Ocean being a much wished for consummation.

As our readers will probably remember, two pairs of spawning lobsters were carried across the continent by Mr. Stone in 1874, in the second California Aquarium Car, but as they were in a feeble condition on arrival, having been nine days from the sea, and as they were deposited in the Bay of San Francisco instead of the Pacific Ocean it is considered doubtful whether anything ever came of them, and it has been decided to make an effort to place the undertaking on a surer foundation. We hope in a week or two to give the results of the experiments referred to.

SALMON IN NEW JERSEY.—The efforts of the New Jersey Game Protective Association to propagate salmon in the streams of the State are publicly reported to have been successful. This statement implies a good deal scientifically, as the natural range of this salmon has not been regarded as extending south of the Connecticut River.

Natural History.

For Forest and Stream.

OUR WINTER VISITORS.

THE hairy and downy woodpecker are so much alike in their markings that, at a distance, one might be mistaken for the other; but they differ much in size, the hairy out-measuring in length his downy cousin by one-third, and looking fully twice as large, and his bill is much longer in proportion to the size of the head. This is the third winter during which a pair of both kinds have been almost constant daily visitors at our chamber window, so that we have ample opportunity to observe them.

I nailed up a weather-beaten board at the window, and on this shelf we fasten scraps of untried beef tallow; to feed on this come, beside the woodpeckers, and as constantly, a pair of white-breasted nuthatches and a pair or two of chicadees. Now and then two or three blue jays are partakers at our board, the handsomest of all our pensioners, but greedy fellows, and never satisfied while a morsel of food remains.

For all their long acquaintance with us, none of the birds seem able to overcome their shyness beyond a certain point, and are constantly on the lookout for danger. The least suspicious are the chicadees, next the nuthatches, and then the downys. The hairys are very shy, taking flight at the least motion made near them inside the window, and the jays are shyest of all. Very seldom are two birds of a kind on the board at once; of different kinds, never. When two of a kind do alight there, both keep up a terrible scolding, and one soon departs. Of the different kinds, the smaller always gives way to the larger except in the case of the nuthatch and the downy, the latter often taking flight on the approach of the former, but only if the nuthatch comes from above.

Each bird has its own manner of approach. The jay comes down with a bounce from a branch of locust near by and falls to at once, making the most of his time. The hairy woodpecker sometimes alights directly on the board, but oftenest below, and from thence creeps up to it, or alights on the window-casing and backs down to it. The female always announces her arrival by a sharp, short, unpleasant "peep!" uttered at frequent intervals; the male keeps silent. They never begin to feed without first making many sharp, suspicious glances all about. The approach of the downys is oftener from the under side of the board, the claws grasping the edge, the head just above it, making a careful reconnoisance. The prominent white rim around the eyes of the female gives her the ludicrous appearance of having put on silver-bowed spectacles, the better to discern causes of suspicion or danger. The nuthatches alight on the board or on the window-casing above, and creep down to it, head foremost, sometimes sounding a few notes of his soft penny-trumpet. The merry little chicadee alights from a perch on the locust, or the lilac bush, his small body apparently possessed with fear of the other birds, for he casts many anxious glances about him before he begins to eat. Sometimes he utters a faint, lisping note, and occasionally that which gives him his familiar name, but I have never heard from him while here his soft, clear "pee-wee-wee," to me one of the sweetest of all bird noises.

If the meat is frozen or at all hard, the woodpeckers hammer away at it as vigorously as at the wood in which their insect food is cased, and with as downright blows do the jays and nuthatches detach fragments of it, rising on tip-toe and slightly spreading their wings to add force to the blow in a way curious to see. These reinforcements the woodpeckers do not employ, but "strike from the shoulder," holding on with claws and bracing with tail. Yesterday I nailed a piece of tallow close to the edge of the board to see if the support of the tail were quite necessary in their labors. With one exception they have come this side where the tail could prop as usual. Once the female downy took two mouthfuls, clinging on the outer edge, but they evidently were not satisfactory, for seeing the premises clear she then came on the inside and ate her supper with relish. If the

fat is soft, all these birds gobble it up like hens, at big mouthfuls. If the large ones succeed in detaching good-sized pieces of it they at once bear them away and hide them, and return quickly for more. When the pieces are small, if they wish to replenish their storehouses, the loading of their freight is attended with some difficulty, for when the bill is pretty well filled, and necessarily well open, the last lumps fall out; time after time, in trying to get more, I have seen a hairy fly off at last well-ladened with a row of seven or eight lumps in his bill. The jays seem to fill their throats as well as bills, and then fly away to hide the booty. Of kernels of corn, which we put out for them, they will take eight at a time. None of the other birds ever touch this except the nuthatches, who occasionally carry away a kernel, though I doubt if they eat it. They sometimes carry away a piece of tallow as large as their own heads, and sometimes start with one so large the slender bill is forced to drop it. The hole the bill makes in the tallow is round and deep, and is just the size of a common darning-needle. The chickadees are the daintiest feeders of all, making a meal of crumbs too insignificant for the others to notice, and stopping after every mouthful or two to look about them for their bulkier fellows. If they detach a larger bit, they bear it away to a neighboring branch and eat it at their leisure.

The nuthatch after taking a bite will often hop to the edge of the board and peep over. Sometimes, after eating his fill, he settles himself on his dining-table for a comfortable after-dinner rest, not nap, for he does not close his bright eyes. With his head drawn in, his bill slightly elevated, his tail in line with it and his feet tucked closely under him, he looks less like a bird than like a tiny narwhal stranded on the shores of Lilliput. The female downy, too, rests here at times, and so do the chickadees. The hairys and jays are always off as soon as they have got what food they can.

In the spring of 1875 the hairys began housekeeping in a room they had scooped out for themselves in an old apple tree near by, and therein reared a family. During the infancy of their brood the old ones came often to the board for food, of which they bore away great mouthfuls. At last, when the young were nearly full grown, their old man brought three of them to the adjacent locust tree, on which they sat while in great haste he carried them as much as he could hold in his bill of fat, poking it with violent thrusts far down their throats, and they, while not receiving food, keeping up a most discordant yelping.

Last fall, when the first snows came, a nuthatch fluttered about the window, evidently disappointed that the table was not already spread. Within ten minutes of the time we nailed on some pieces of fat, two nuthatches, three chickadees and the female downy visited the board in quick succession. They must have been on the lookout near by, or at least somewhat within sound of the hammer.

The hairys longer claim eleemosynary aid than any of the others of our pensioners, the jays deserting us first, the downys, nuthatches and chickadees leaving as soon as the supply of insect food becomes abundant. We part with them with no little regret, and gladly welcome their return when "the melancholy days have come," for their daily visits do much to cheer the loneliness of winter. Long may our little Russians hold us as their friends, and claim of us their daily tallow. AWAHSOOSE.

BIRDS OF THE COTEAU DES PRAIRIES OF EASTERN DAKOTA.

BY CHARLES E. M'CHESNEY, M. D., U. S. A.

(Continued.)

Euspiza americana Black-throated bunting. Is found here from June 9th to July 26th in considerable numbers.

Dolichonyx oryzivorus. Bobolink. Arrives May 19th and remains until July 24th in quite large numbers; breeds here.

Molothrus pecoris. Cow-bird. Is seen from April 17th to October 28th in very large numbers; breeds here.

Agelæus phœniceus. Red-winged blackbird. Arrives April 17th and remains until October 28th. Quite numerous; breeds here.

Xanthocephalus xterocephalus. Yellow-headed blackbird. Arrives April 29th to remain until September 28th. Is found in large numbers. It will be observed that this bird arrives a little later, and takes its departure long before the other blackbirds do; breeds here.

Sturnella magna var. *neglecta.* Western field lark. This is one of the earliest of our spring arrivals, making its appearance about April 13th; it remains until October 14th. Is very numerous; breeds here.

Icterus baltimore. Baltimore oriole. Arrives about May 19th and disappears September 1st. Very rare; it may breed here.

Quiscalus purpureus. Purple grackle. This bird arrives April 17th, and from that time to its departure, November 10th, is found in very large numbers all over the prairie.

Corvus corax. Raven. The only ravens I have ever seen on the "Coteau des Prairies" were a pair of young ones, procured by me from Indians, July 9, 1873.

Corvus americanus. Common crow. The common crow is a very rare visitor with us. It is occasionally seen late in winter and in the early spring, but does not remain.

Tyrannus carolinensis. Bee martin. Arrives May 16th and departs September 9th. Is very numerous during this time; breeds here.

Tyrannus verticalis. Arkansas fly-catcher. Is found from May 22d to September 9th in considerable numbers, but is not near as numerous as *T. carolinensis*, with whom it appears to be constantly associated; breeds here.

Chordeiles virginianus Night hawk. Appears May 25th; breeds here. Is found in large numbers. Leaves September 17th.

Melanerpes erythrocephalus. Red-headed woodpecker. Appears June 5th. Does not, however, remain in this vicinity more than a few days; is rare.

Colaptes auratus. Golden-winged woodpecker. First appears June 23d. Is not very numerous. Remains until October 10th. I am not sure whether this bird breeds here.

Bubo virginianus. Great horned owl. The only owl I have seen on the "Coteau des Prairies" was one presented to me September 30, 1876, which had been killed that day a short distance from Fort Sisseton. It was apparently a full-grown specimen.

Circus cyaneus var. *Hudsonius.* Marsh-hawk. Arrives May 2d and remains until October 14th. Is seen in small numbers; breeds here.

Accipiter fuscus. Sharp-shinned hawk. Is found in small numbers from May 1st to October 30th; breeds here;

Falco communis. Duck-hawk. Arrives April 5th and departs October 30th. Is quite numerous during this time.

Falco sparverius. Sparrow-hawk. Is found from April 15th to October 23d. Is at no time very abundant; breeds here.

Buteo swainsoni. Swainson's buzzard Arrives May 10th and remains until October 30th. Is seen in considerable numbers; breeds here.

Cathartes aura. Turkey-buzzard. Is found here from May 24th to October 30th in large numbers; breeds here.

[To be continued].

FAUNA OF MICHIGAN.

BY ARCHER.

(Continued).

ORDER RODENTIA.

FAMILY SCIURIDÆ.—SUB FAMILY SCIURINÆ.

Sciurus vulpinus. Good. Var. Fox squirrel.

S. ludovicianus. Har. Fox squirrel.

S. niger. Linn. Black squirrel.

S. migratorus. Aud. and Bach. Gray squirrel, also var. *Carolinensis.* Gmel.

S. hudsonius. Pallas. Red squirrel.

Sciuropterus volucella. Pallas. Flying squirrel; miscalled *Pteromys volucella;* there being none of the genus *Pteromys* in the U. S.

Tamias striatus. Linn. Chipmonk; hackee.

Spermophilus tridecem lineatus. Aud. and Bach. Striped prairie squirrel; sometimes miscalled gopher.

Spermophilus franklini. F. Cuv. Gopher.

Geomys bursarius. Rich. True gopher. Of the last three varieties the first was, as are the last two, confined to the lower tier of counties, but now may be found as far North as Saginaw Bay, it following closely the axe of the pioneer.

Arctomys monax. Gmel. Woodchuck; ground hog.

SUB FAMILY CASTORINÆ.

Castor canadensis. Kuhl. Beaver. A few still remain in the Lower Peninsula in Alcona County.

FAMILY MURIDÆ.—SUB FAMILY DIPODINÆ.

Jaculus hudsonius. Bd. Jumping mouse.

SUB FAMILY MURINÆ.

Mus rattus. Linn. Black rat.

Mus decumanus. Pall. Norway rat.

Mus musculus. Linn. Common mouse.

Hesperomys leucopus. Le Conte. Deer mouse.

Hesperomys michiganensis. Way. Prairie mouse.

Rithrodon Humilus. Baird. Harvest mouse.

SUB FAMILY ARVICOLINÆ.

Arvicola reparia. Ord. Meadow mouse.

Fiber zibethicus. Cuv. Musquash, Muskrat.

FAMILY HYSTRICIDÆ.

Erethizon dorsatus. F. Cuv. Porcupine; hedgehog.

ORDER RUNNINANTIA.

Alce Americanus. Jard. *Cervus alces.* Linn. *Alces malchis.* Jard. Moose The moose is seldom seen within the limits of the State. A bull moose was killed near Alpena in '72, and a cow moose was killed by Robert. Graham on the Gaibrait's Line in Sanitee County, November 23, 1873.

Rangifer caribou. Aud. and Bach. Woodland caribou; American reindeer. Is occasionally taken by the hunters in the Upper Peninsula.

Cervus canadensis. Erxl. Wapiti or American elk. Is still found upon the peninsula enclosed by the waters of Lake Huron and Saginaw Bay, in Huron and Sanilac Counties.

Cervus virginianus. Virginia or red deer.

FAMILY LEPOSIDÆ.

Lepus Americanus. Erxl. Northern hare.

Lepus sylvaticus. Bach. Gray hare; gray rabbit.

[To be Continued].

DR. ELLIOTT COUES, U. S. A.—We congratulate this eminent and persevering scholar upon his recent election as a member of the National Academy of Sciences, one of the highest honors to which American scientists aspire in this country.

ARRIVALS AND DEATHS AT THE PHILADELPHIA ZOOLOGICAL GARDEN FOR WEEK ENDING APRIL 24TH.—One Aconchy (*Dasyprocta acouchy*), Erxl., born in garden; two short-eared owls (*Brachyotus palustris*), presented; two young horned owls (*Bubo virginianus*), Bonap., presented; one Angora goat (*Capra hirous*), born in garden.

DEATHS.—Four bald eagles; one golden pheasant; one diamond finch; one guan; one wild goose; two horned owls; one prehensile porcupine

ARTHUR E. BROWN, Gen'l. Supt.

Woodland, Farm and Garden.

CHANGING THE NATURAL FORM OF PLANTS.

VARIETY in gardening does not consist wholly, as some appear to suppose, in the number of kinds or species of plants obtained and cultivated. Diversity of form obtained by training them will frequently produce almost, if not quite, as beautiful an effect as great variety, and herein lies much of what is termed skillful and successful gardening. Suppose, for instance, one has two varieties of the dwarf double flowering almonds, the white and pink. A clump of each are pretty ornaments to start with. Then a change can be made by putting the pink sort in the centre of the group, and a row of white outside, and in such a position that one can look down upon the clump instead of a side view. Then this order may be reversed, or a long ribbon of pink and white may be made by planting a row of each side by side. A far more elegant shrub is produced by budding these plants upon peach or plum stocks, and four or five feet from the ground. A stock may be budded in August or September, with one variety only, or a few buds of white almond put on the centre shoots, and a row of pink on the outside. The white-flowered sort has quite stiff, upright-growing branches, while those of the pink are long and slender, and when budded in this manner will bend over most gracefully when loaded with flowers. Of course it is presumed that every one who has a garden knows how to bud and graft trees; if not, they should learn without unnecessary delay. Perhaps these few hints given will set the reader thinking how other departures from standard types can be secured; if so, everything depends upon the persistency of the effort in that direction. Many persons, however, are prone to think that it will not answer to depart from the natural "bent" of the plant; therefore, their climbing plants are always treated as climbers—never as bedding, or low trailers. A prairie rose looks well upon a trellis or trained to a pole, but is also beautiful when pegged down to the ground to form a rosy cushion a few inches high. The lovely clematis jackmanii is unsurpassed when trained in this manner, as all who have visited Mr. Hunnewell's, at Wellesley, near Boston, when the rows of it round his beds of rhododendrons were in bloom, can testify. Honeysuckles trained over an old rock or heap of stone look as well, if not better, than when covering some costly trellis. Wistarias may be trained as low or high shrubs, although they are classed among the climbers. Because a plant grows naturally tall and slender, it does not follow that its form cannot be modified to suit our taste in the matter. By lopping off a branch here, and bending another there, natural forms may be changed without seriously interfering with natural laws, and by a little forethought and consideration as to the effect we wish to produce, there is little danger of falling far short of the object sought. There are usually more or less waste materials about a place which can be used to advantage in this way. Any seedling peaches, plums, cherries or apples can be utilized, and in fact stone heaps, rubbish piles, old stumps, or even half-dead trees may be made useful as well as ornamental.

HINTS ABOUT FLOWERS.—House plants ought to be stimulated gently once or twice a week. Rain water, so refreshing to summer flowers, always contains ammonia, which also abounds in all liquid manures. If you take an ounce of pulverized carbonate of ammonia, dissolved in one gallon of water, it will make spring water even more stimulating to your plants than rain water. If you water your plants once in two weeks with guano water (one tablespoonful to a pail of water), they will grow more thrifty. Chicken manure dissolved in water is excellent. Always keep the soil in your flower pots loose. A common hair-pin used daily will stir the earth sufficiently.—*Boston Journal of Chemistry.*

IVY ON WALLS.—There is a popular belief that ivy growing on a building renders it damp and unhealthy, which is quite unreasonable; in fact, if a wall, particularly a north wall, be damp, the best treatment is to plant English ivies at its base; for not only does the dense foliage of the plant keep out rain, but its aerial roots absorb the moisture already in the wall.

GROWING TUBEROSES.—To cultivate the tuberose, the most beautiful of all plants, says an experienced horticulturist, put the bulbs in six-inch pots, three in each, and use a mixture of equal parts turfy loam, peat and leaf mould, and place them in a pit. Give very little water at first; and as they commence to grow freely increase it, and keep near the glass. When they begin to push up their flower spikes, they will, of necessity, require to be placed where they will have sufficient space for the proper development of the tall spikes. These will come in bloom from August to October, when they will require a temperature ranging from sixty to eighty degrees, the latter being preferable.—*Scientific American.*

THE GRASSHOPPERS AND WILD FOWL.

POMEROY, Iowa, April 13, 1877.

EDITOR FOREST AND STREAM.

Spring is now fairly opened, and I send you a few notes on the prospect in these parts. To begin with, the prospect for grasshoppers was never better; every piece of newly broken land is literally seeded to them, and thoroughly too; the eggs seem healthy as need be, and two days since I noticed the young hoppers for the first, as lively as flies in August, and just as thick. If they are not the most welcome guests to the farmers, they will be hailed as manna by all kinds of wild and tame fowl—grouse and turkeys in particular. The outlook for grouse this season is something to be proud of. There was never such a breeding stock as at present, for the fields are alive with them, and on sunny mornings the air is resonant with the sound of their love-making; this, with the music of other birds, makes a perfect spring chorus, something wonderful when one listens to it for the first. I well remember some twelve years ago, when, fresh from the cities of the Eastern States, I came on a visit to Iowa, and heard for the first time grouse booming on the prairie, and thought that such sounds could only emanate from the throat of some animal, wild and fierce, and was inclined to be timid about venturing on the prairie alone, but the information that the dreaded sounds were nothing more than grouse "crowing," made my courage itself again. Geese have been here since January 30th, and ducks came about the same time. On the 11th inst. I saw and bagged the first English snipe, and now they are quite plenty and afford rare sport; the 16th inst. Bartram's sandpiper was first seen, his familiar whistle sounding a cheery "how-do-you-do." Yellow-legs and tatlers, killdeers, etc, have been here about two weeks, and are plenty enough to give the tyro good shooting; they are in fair flesh, and make suitable *materielle* for a pot-pie, that most delicious of sportsman's dishes; and now, while I turn from the quill to the "Parker" fowling-piece, for a short time, adieu. ABE DAGOTAH.

CONSUMPTION CURED.—An old physician retired from active practice having had placed in his hands by an East Indian missionary the formula of a simple vegetable remedy for the speedy and permanent cure of Consumption, Bronchitis, Catarrh, Asthma, and all Throat and Lung affections, also a positive and radical cure for Nervous Debility and all nervous complaints, after having thoroughly tested its wonderful curative powers in thousands of cases, feels it his duty to make it known to his suffering fellows. Actuated by this motive, and a conscientious desire to relieve human suffering, he will send, free of charge, to all who desire it, this recipe, with full directions for preparing and successfully using. Sent by return mail by addressing with stamp, naming this paper, Dr. J. C. STONE, 32 North Fifth Street, Philadelphia, Pa.—*Adv.*

Rifle.

CREEDMOOR.—Owing to the wretched weather on Saturday the match for the "Marksman's" or "Poppenhusen" badge was not shot. The members of the Seventh Regiment Rifle Club, however, undeterred by the rain, contested for the Morris medal, which was won for the second time by Mr. G. I. Merchant of Company L.

AMATEUR RIFLE CLUB.—Members will take notice that the competitions for places on the Club Teams, fixed for May 1st and June 5th, will take place on May 2d and June 6th, instead of on the dates first named.

GLEN DRAKE.—The spring meeting of the American Rifle Association commences to-day, in their range at Glen Drake. The programme comprises the following matches:

All-Comers.—Conditions.—Distance, 200 yards; position, off-hand; rifle, any within the rules. Entrance fee, $1. Five scoring shots. Two sighting shots allowed. Prize, valuable field glass.

Military.—Conditions.—Distance, 200 yards; position, off-hand; rifle, military, 50-calibre, State pattern. Five scoring shots. Two sighting shots allowed. Entries not limited. Entrance fee, $1. Prize, Holden rifle.

Subscription, No. 1.—Conditions.—Distance, 200 yards; position, off-hand; rifle, any within rules. Five scoring shots. Two sighting shots allowed. Entries not limited. Entrance fee, $1.

Subscription, No. 2.—Conditions.—Distance, 200 yards; position, any; rifle, State military. Five scoring shots. Two sighting shots allowed. Entries not limited. Entrance fee, 50 cents.

Firing in above matches to commence at 1 P. M. Entries close at one.

On Saturday, May 5th, a special match will be shot for prize Remington sewing machine, value $75, presented by Remington Sewing Machine Company. Open to residents of Westchester County only.

Conditions.—Must be won twice (not necessarily consecutively) before becoming property of winner. Distance, 500 yards; position, any; rifle, any. Ten shots. No sighting shots. Military rifle, State model Remington allowed twelve shots. Entries not limited. Entrance fee, $1.

The following prizes will be shot for as soon as possible this season. De Peyster Medal, value, $300; must be won three times (not necessarily consecutively) before becoming property of winner. Distance, 300 yards; position, off-hand. Shonnard prize, silver; Wright medal, gold; A. R. A. prize, gold, silver and bronze.

CONLIN'S BENEFIT.—The rifle tournament tendered to Mr. J. S. Conlin for the purpose of assisting him in the refitting of a new gallery has ended; it was held at Zettler's gallery, and the success of the undertaking was beyond the expectation of its originators. The prizes were forty in number and valued $250; they were all presented as trophies by Mr. Conlin's fellow riflemen and patrons.

The conditions were: Three shots, rifle, 22 cal., off-hand, distance 100 feet at a two-inch bull's-eye, string measurement; that is to say, the total measurement of the three shots from the center of each shot to the center of the bull's-eye.

A competitor can shoot as many tickets as he may desire, but can only win one prize.

The shooting was kept up with great spirit, and to win the first prize was a victory indeed, for, without doubt, the best shots in this part of the country were competitors.

The following are the names of the winners:

Chas. Judson, Frank Patterson, C. E. Blydenburgh, J. F. Murch, Leon Backer, D. L. Beckwith, John Maguire, Wm. Weigandt, Robt. O'Donnell, Robt. Miley, M. L. Riggs, T. Wildes, M.D., P. Fenning, J. R. Grohman, J. B. Blydenburgh, A. Ermish, Wm. Klein, H. D. Blydenburgh, Fred'k Kessler, H. Masen, C. A. Cheever, John Dutil, T. C. Noone, W. F. Banks, A. Seitz, John Fenton, L. V. Sone, W. Kruber, W. H. Candee, R. Duff, M. B. Engel, R. Kelse, Wm. Hayes, E. B. Gray, G. A. Schürman, J. L. J. Kellner, I. Kleisrath, David Miller, Wm. Robinson, M. P. Lennon.

The best target measured 9-16 of an inch, while the last of the winning scores was only 1⅞ inches. By this it can be seen the contest was a close one, and to win the last prize was no easy task.

NEW YORK.—The first match of the Jamaica (L. I.) Rod and Rifle Association for the champion badge of 1877 was shot for on their range on Wednesday, April 25th. The following scores were made:

Name.	Score.									Total.
John M. Crane	4	5	4	5	5	4	5	5	5	5—47
Wm. S. Elmendorf	4	4	5	3	5	5	5	5	5	4—45
Thomas Lloyd	4	5	4	4	5	4	4	5	5	4—44
John Fleming	4	4	4	4	4	6	5	4	5	4—43
Geo. H. Creed	5	4	4	5	5	4	4	4	4	4—43
Wm. S. Cogswell	4	4	4	4	5	4	4	4	5	4—42
John B. Fleury	4	5	4	4	4	4	5	4	4	4—42
Geo. A. Hicks	4	4	4	4	4	4	4	4	4	4—40
Theo. Rogers	4	4	4	4	4	0	4	4	4	4—36

Milner, Irish team, has had the rheumatics almost all winter.

Weber, American team, is greatly pleased with California. The riflemen, and in fact everybody, treated him "bang up."

Homer Fisher thinks he has *the gun*. It is a muzzle-loader.

The Zettler Rifle Association will have a shooting festival during the early part of this month at Jones' Woods.

Several of the American team of '76 are shooting in the present competitions at Creedmoor under assumed names.

California is to be represented by a regimental team to shoot at Creedmoor this fall.

A match between the Zettler Rifle Association and Conlin's Gallery Team will take place May 10. Each side to be represented by ten men.

Game Bag and Gun.

MAY IS A CLOSE MONTH FOR GAME.

THE STATE BADGE.—We printed last week a cut of the State Badge, presented by the President of the State Sportsman's Association, Greene Smith, Esq., to be shot for during the coming Convention at Syracuse. Our space prevented us at that time from giving the description of it, which will be found below:

The badge is of fine gold of various colors, and measures 7¼ inches in length; the upper part or bar pin is about 3¼ inches across, and is beautifully ornamented with the most minute scroll engraving, on which is enameled in bold black figures 1877. From this piece hangs a massive medal, having the arms of the State of New York with the supporters, two female figures, liberty and justice, raised in a bold and artistic manner. The effect of the different colors of gold used in the landscape part of the arms is a very beautiful piece of work. The box which contains the badge is a miniature gun-case of silver and copper, the back of the case being an excellent imitation of wood, the grain being worked in copper by a process never before tried. It calls to mind the twist of a fine Damascus barrel. The straps and buckles are a splendid imitation of the real thing.

SHOOTING TOURNAMENT.—A grand shooting tournament will be held in Lexington, Kentucky, from the 12th of May to the 19th inclusive. Nearly $4,000 in prize money is offered, divided between some fifteen matches. All information can be had by addressing Major J. M. Taylor, Lexington, Kentucky, or E. T. Martin, Chicago, Illinois.

A SINGULAR RELIC.—We have received from an esteemed correspondent, "Guyon" of Corinth, Miss., per express, a percussion musket which was picked up on the old battlefield at Corinth, and being carelessly handled went off one night accidentally and killed a wolf, which happened to be within range, three hundred yards away. This is the way the legend runs, as stated upon the cabalistic card that accompanies the gun. We believe it. We believe that any gun which goes off will hit something, whatever that something happens to be—it may be a wolf—it may be a major-general. We are much obliged for this relic. It has seen rough times during the war, and no doubt did its duty then. But whatever its duty might have been regarded at the time, we consider it much better employed in killing wolves accidentally than in annihilating men on purpose.

—WE take pleasure in referring to the removal of Messrs. Hodgkins & Haigh to their spacious rooms 298 Broadway, where can be seen one of the finest assortments of guns and sporting goods that can be found in the city. The members of this firm were born in the trade, and their fathers before them; and if long service, strict integrity, and application to business constitute legitimacy, we see no reason why this house may not receive a large share of the trade.

LONG ISLAND.—The regular monthly contest of the Long Island Shooting Club for the Members' Cup was shot on Friday last on the grounds at Dexter Park. The conditions were, 7 birds each, 25 yards rise (the holder of the cup 27 yards), Long Island rules; 17 members participated with the following result:

C. Hance	6	Redden	2
Talbot	4	Thompson	2
Johnson	4	Walton	2
Brown	3	Broadway	2
Blankley	3	Blake	1
Henderson	3	Eddy	1
Appleyard	3	Jordan	1
Wynn	2	Webster	0
Williams	2		

BROOKLYN.—The first match of the United Pigeon Club of Brooklyn was shot on Thursday, April 26, 1877, at New Lots, L. I., the conditions being 11 birds each, 21 yards rise, 80 yards boundary, with the following result:

Name.	Total.	Name.	Total.
Helmstedt	10	Tomford	9
Knebel	10	Schlieman	8
Shroeder	9	Bohling	5
Lemken	9	Van Staden	4

RHODE ISLAND.—*Providence, April 26th*, 1877.—At the annual meeting of the Rhode Island Amateur Rifle Club, the following gentlemen were elected officers for the ensuing year: President, F. J. Rabbeth; Vice-President, J. H. Crowell; Treasurer, Geo. H. Clarke; Secretary, John Howe; Range Committee, F. J. Rabbeth, Geo. W. Davison, and Charles H. Perkins; Executive Committee, Charles F. Pope, C. H. Guild, C. H. Perkins, Geo. W. Davison, and E. Thomas.

THE SHENANDOAH REGION.

STAUNTON, Augusta Co., Va., April 18, 1877.

EDITOR FOREST AND STREAM.

In reading your very excellent paper I find news from the sportsmen of nearly the whole country, except this Shenandoah Valley and the mountains immediately west of it; and yet there is much game and fish in this region, and there are many men here who are devoted sportsmen; but, until lately, they have contented themselves with pursuing their game in their own somewhat primitive ways, without concern about what was going on elsewhere. There was no conceit and little sympathy, either among themselves or with men of like tastes in other localities. Except a few packs of fox-hounds brought from Eastern Virginia, a few isolated squirrel or coon dogs, of no breed at all, and an occasional pointer of very doubtful pedigree, there were no hunting dogs. The fishing was generally done with the tail-net or the gig, and partridges (quail) were caught in nets or traps. The rifle was the usual weapon, with an occasional single-barrel shot gun. Double-barrels of any kind were rare, and fine guns of this description almost unknown. This was the general state of the case, although, of course, there were some exceptions to it. There were a few good bird dogs, and there were some fair wing shots.

Within the last twenty-five years, however, railways have come among us, and the increased facility of communication has worked its legitimate results upon the sportsmen of this lovely valley, as well as upon its farmers, mechanics, etc. Our breeds of pointers and setters are improved and improving, while the coon dog and his squirrel brother are fast disappearing. Shooting on the wing is now considered the only respectable way of taking a partridge, and such a thing as a single-barrel fowling piece is unknown, excepting always the invariable old musket or three-dollar-and-a-half single barrel of the colored troops, with which they wage a never ceasing war upon everything that wears fur or feathers. We have become familiar, by experience, with some of the best specimens of the breech-loaders of Westley Richards, William Greener, and other famous English gun-makers, and have begun to turn our attention to the fly-rod and the oiled silk line instead of the tail-net, the hickory loop hole, and the home-made flax or horse-hair line.

A marked era in this happy change, is the formation of Sportsmen's Clubs in the various counties of the State, with the design of assisting the State authorities in their endeavor to care for the fish and game of the State, which, under a wretched system—or rather no system at all—were rapidly disappearing. Their influence, brought to bear upon the Legislature at its last session, gave us two very good laws, one for the protection of game, the other for the protection and propagation of fish. At a previous session ('75-'76) they had made a small appropriation ($5,000) for the purpose of enabling the Fish Commissioners to erect hatching-houses, and procure a supply of fish-spawn from the Commissioner of the General Government. This appropriation, though ridiculously small, has been most judiciously expended. Two hatching-houses have been established (at Lexington and Blacksburg), and young fry of the brook trout (*salmo fontinalis*), the California salmon, and the land-locked salmon, are furnished to whoever in the State will engage to turn them loose in suitable streams, the appropriation being too small to admit of the Commissioners making the distribution in any other way. Black bass were introduced into all the waters of the Potomac and James about 1871-'72, and are now beginning to afford fine sport. At Clifton Forge, in Alleghany County, last August, I saw one, just caught, that weighed four pounds and a quarter. Such a fish, in a deep, swift running stream, at the end of a sixteen-ounce rod, is no joke. Neither is he a very bad joke—at dinner in camp, after the day's labors are over, and you feel the gnawings of such an appetite as only mountain air and hard exercise for ten hours continuously can give you.

Our trout are very numerous, but they are generally not large. The average is, probably, nine inches. Sometimes we take them running up to fifteen and eighteen inches, but these are rare. The season for catching them has just opened. I saw one lot of one hundred and forty-nine caught by a party of three, and heard of another of one hundred and twenty-five caught by one man out of one stream within twenty-five miles of Staunton. Later in the season we go further from home to larger water, and catch bigger fish; *e. g.*, in the Cowpasture River, in Bath County, there were caught last summer, in one pool in one day one man, thirty brook trout, which weighed a fraction over eighty-three pounds. The bait used was live grasshopper. In streams of this Cowpasture the fly can be used to advantage, but in the most of our smaller mountain "branches"—as we call them—it cannot. For bass we use live bait of almost any description—toads, frogs, crayfish, and especially minnows. I have heard of none being taken in the waters of the James or the Shenandoah with the fly, although the attempt has been made repeatedly.

Last fall the partridges (quail) were very abundant in all of the Shenandoah Valley counties. In the wide, open fields of these counties this sport is delightful. Think of tramping all day through the stubble on these breezy uplands, with the November air just keen enough to be bracing, and the sun shining redly through the mellow, Indian summer haze! Why, even if there were no such things as guns, or dogs, or birds, it is charming of itself. On such days—and we have many such—in such air, one feels the true joy of existence—thankfulness for mere life apart from anything save the bare fact of living. But I grow sentimental, as I always do when I get on this subject.

To come down to the sober facts of life, our Club, known as the Augusta Sportsman's Association, was organized about the middle of March, with the following officers: William L. Bumgardner, President; H. C. Palmer, G. G. Gooch, James A. Patrick, Vice-Presidents; C. S. Arnall, J. H. Woodward, L. Harman, Frank Clemmer, Ex. Com.; J. H. Scherer, Quartermaster; James Ket, Secretary and Treasurer. Its objects are, briefly, to assist the authorities in endeavors to carry out the provisions of the game and fish laws; to cultivate friendly relations with land-owners, to raise money to purchase more expensive camping and boating equipage than individuals can afford to bring together and make acquainted men of kindred tastes; to try to improve our breeds of dogs, etc.

If any gentleman in search of shooting or fishing in this section of the country desires information as to localities, prices, transportation, etc., if he will address our President (Capt. W. L. Bumgardner, Staunton, Va.), any information or assistance in our power will be cheerfully given. We want people abroad to know what a land we have here, and we know that to be thoroughly acquainted with a country implies a little more than a glimpse from a car window or the top of a stage-coach.

ASA.

CHILDREN are subject to a thousand discomforts that it would be difficult for a grown person to appreciate. One very effectual way to obviate their troubles is by using B. T. Babbitt's Toilet Soap, which has no equal in all ingenious rivalries of manufacturing. In other words, the hygienic purity of its components, exhaling without extrinsic aid a delicate perfume, makes it the apex of excellence.—*Adv.*

Sea and River Fishing.

FISH IN SEASON IN MAY.

Trout, *Salmo fontinalis*. Salmon Trout, *Salmo confinis*.
Salmon, *Salmo salar*, Shad, *Alosa sapidissima*.
Land-locked Salmon, *Salmo sebago*.

***For trout flies in season in May see our issue of April 26th.

FISH IN MARKET.—Mackerel and shad have been very abundant during the week. The first sheepshead of the season was caught at Windmill Point, North Carolina, and exhibited at Mr. Blackford's on Monday. Our quotations are Striped bass, 12½ to 20 cents per pound; smelts, 10 cents; salmon (frozen), 40 cents; Kennebec, 75 cents; mackerel, 15 cents each; shad (southern), 25 cents each; native, do. 30 cents; Connecticut River, 50 cents; white perch, 15 cents per pound; Spanish mackerel, 75 cents; green turtle, 18 cents; terrapin, $15 per dozen; frostfish, 8 cents per pound; halibut 15 cents; haddock, 6 cents; codfish, 8 cents; blackfish, 15 cents; herrings, 5 cents; flounders, 8 cents; sea bass, 20 cents; eels, 18 cents; lobsters, 10 cents; scollops, $1.50 per gallon; whitefish, 15 cents per pound; pickerel, 15 cents; salmon trout 18 cents; Long Island trout, $1; Canada do. 50 cents; hard shell crabs, $3.50 per 100; red snappers, 18 cents.

NEW YORK.—*Lake George, April 25th*.—The season for trolling for lake trout has now commenced. Yesterday a man, while hunting rattlesnakes at a den, was bitten on the hand and is not expected to live. OLD PILOT.

THE ADIRONDACKS.—*Keeseville, N. Y., April 25th*.—You can announce to those on the anxious seat that the ice bridge of the Saranacs is dissolved, and navigation resumed between Martin's and Bartlett's—so says a telegram just received. I am off soon on my twenty-fifth annual trip to the dear old woods. J. R. ROMEYN.

Meacham Lake, April 16th.—Our spring has opened very early and very warm. The snow is nearly all gone from the woods, has melted away with the sun. The blue birds, robins and ground sparrows arrived April 1st. Nearly all of our spring birds have arrived, and the partridges are drumming lively. The ice is out of the lakes. Our season will be full three weeks earlier than any season during the past ten years. The roads are dry and dusty. My little salmon and speckled trout are all out from hatching-boxes and tank; they have done very well; I have saved a much larger per cent. than any year since I began here. We find the little chaps feeding along the shore of the lake in all directions. They are many of them one and a half inches long. I feel greatly pleased, and am perfectly satisfied I can keep the stock in the lake good at a very small expense each year. This season the whole expense, counting my time and all, has not been fifty dollars, for at least one hundred thousand fry. A. R. FULLER.

[The above letter from Mr. Fuller will be read with much interest by those anglers who contemplate visiting the Adirondacks this spring. The month of May is eminently the month for trout. The fish are strong, active and hungry. They lie in the rapids and swift-running water. They are *game*. Besides, there are no flies, pungies or mosquitoes to annoy. Mr. Fuller's efforts to stock the lakes will be appreciated, while the success which has attended them and the collateral trifling expense will attract the attention of fish culturists and stimulate them to a prosecution of the business by the encouragement his experience affords.—ED.]

MASSACHUSETTS.—*New Bedford, April 24th*.—The recent "spell" of weather has had the effect of filling our markets with a "multitude of fishes," cod, halibut, tautog, herrings, etc. The trout fishermen in the Old Colony have been enjoying rare sport. One fish weighing two pounds and five ounces was caught by Frank Washburn. They were hawked around the streets of Wareham last week as plenty as herrings. CONCHA.

FISHING MOVEMENTS.—The number of fishing arrivals at this port the past week has been 24—6 from the Banks and 18 from Georges, bringing 288,000 lbs. codfish and 440,000 lbs. halibut. Georges fish show a further decline, but it is evident that bottom prices have been reached, and the market has been lively, orders for moderate quantities being numerous. The stock is small, with no prospect of large accessions, and prices are a trifle better than last year at this time. Fresh halibut are received in sufficient quantities to meet the call, and fair prices are realized. Fresh mackerel have put in an appearance at the South, but the old stock is too light to be affected by this fact. Haddock are in fair supply, but cusk, pollock, and hake are in light stock, and prices are nominal.

For the first time within the memory of man, the Newburyport clam flats have refused to discount. The recent freshet in the river has buried the flats several feet deep with upland mud, and the succulent bivalves, which have been a staple article of food all through the winter, are not to be "dug." Just such a calamity befell the clam-banks of Seabrook and Hampton many years ago.

There are but three concerns left in the fishing business at Yarmouth, N. S.

One of the Newfoundland vessels recently captured in twenty-six days a cargo of seals worth $126,000, the best single trip ever made.—*Cape Ann Advertiser, April* 28.

THE CAPE COD COUNTRY.—Speaking of Eastern Massachusetts, a correspondent writes:

"The Old Colony Railroad runs through what used to be some of the best shooting and fishing country in New England, and some parts of it are still respectable in those lines, viz: Plymouth Woods (the only place in Massachusetts where deer are now found) which are indented with beautiful lakes, from many of which flow bright sparkling brooks, the home of the speckled trout, and many of the lakes are well stocked with pickerel, bass, perch, etc. At Wareham is found the luscious Wareham oyster, and all down Cape Cod gunning and fishing of pretty fair quality. At Cohasset Narrows we have excellent stripped bass fishing, and from "Buzzards Bay" may be taken all the varieties of salt-water fish that love to congregate in our northern waters. At Chatham one will find pretty good brant shooting at the right season."

—The Germantown *Telegraph* says: Shad-fishermen on the Upper Chesapeake are now hard at work. A correspondent residing on the Maryland shore thus makes public the fact: "The men who are about to engage in gilling shad have this week moved to their field of labor, full of hopes and expectations."

—Shad continue unusually scarce in the Delaware and prices are consequently high. The Gloucester Fishery makes six hauls every twenty-four hours, which yield from fifty to seventy-five shad each. The season thus far has been a very unprofitable one.

BLACK BASS OF THE POTOMAC.

GEORGETOWN, D. C., April 23, 1877.

EDITOR FOREST AND STREAM.

A Washington cockney rushed up to me this morning, and, with his eyes half out of his head, told me he had caught a tremendous lot of black bass at the Little Falls of the Potomac, and that I ought to go up there before it was too late. "How did you take them?" I inquired, and his reply was as follows: "I tried them with bait, but they wouldn't bite; and so I borrowed a scoop-net, and I had splendid luck: took twenty-two fish, and some of them weighed seven pounds." After the gentleman had finished his speech, I presented him with my congratulations as follows: "You ought to be hanged for committing such an outrage; and as I am not in the habit of taking fish out of season, nor of killing hens for the table when they are hatching, I shall not visit the Falls at present."

This incident suggests two or three remarks on the subject of fishing in these parts. It is now more than twenty-five years since I began to fish in the waters of the Potomac, and in all that time I have never failed to try my luck either in the early summer or autumn. Formerly, our only game fish was the rock fish or striped bass, the season commencing about the 10th of June. They were very abundant, and chiefly taken at the Little Falls with bait and the fly, my own preference having always been for the latter method. The largest number that I ever took at one time was thirty-five in a single morning; and while I have never captured a rock-fish in the Potomac which weiged over twelve pounds, I have had the fortune to see much larger fish taken with the bait by the following anglers, viz.: Daniel Webster, Sir John Crampton, General W. H. Emory, and Mr. W. H. Dougall of this place. Indeed, the sport of taking rock-fish at the Little Falls of the Potomac I have long considered as only second to that of catching salmon in Canada or New Brunswick. But I must not, at present, trust my pen upon this theme.

My main purpose in this note is to speak of the black bass of the Potomac. They were introduced into this river from the vicinity of Wheeling less than twenty-five years ago, and they are now very abundant from Cumberland down to Mount Vernon. They are taken everywhere, generally with the minnow, and by a few anglers in favorable places with the fly. Although the laws of New York will allow you to take them there on the 1st of July, they may be taken in this region somewhat earlier—say the first week in June. But the great trouble with which we have to contend on the Potomac is this, that the fish are taken in immense numbers early in the spring, when out of season, and altogether unfit for sport or for the table. The dwellers on the Potomac are generally civilized, and pretend to have laws for the preservation of fish, but they have so much to do with Washington City that they are careless about keeping the laws. All through April and May of each year foolish boys and more foolish men go forth to slaughter the black bass when passing through their spring sickness, and thereby commit an unpardonable outrage against the laws of nature. In my limited sphere I have fought against this custom for several years, and I now recall only two men who have been converted to my way of thinking. One of them took me to a favorite locality in the month of May, and while I allowed him to do all the fishing, I amused myself with the pencil. After he had secured a basket full of bass and we were about to return home, I took one of the fish in my hand and directed his attention to the *worms* that were hidden away at the root of the fins. He was disgusted, and then and there swore that he would never eat one of those fish again. That was not sensible on his part, but his feelings could not be controlled, for from July to November there is no better fish for the table than the black bass. The other conversion alluded to was that of a farmer on the Potomac who had a very dear friend, with whom he had been fishing in the month of May, and who lost his life from eating a black bass out of season and when it was a poison.

For sport or food I think as highly of the black bass as of the trout; I have caught them in the St. Johns, Florida, on the Upper Mississippi, in the Great Lakes, and in the St. Lawrence; these are associated with the most delightful recollections of my boyhood; and hence, the manner in which they are annually slaughtered on the Potomac fills me with pain and indignation. CHARLES LANMAN.

FLY-FISHING EXTRAORDINARY.—Mr. H. Chester Wilson, who has probably taken more trout with the fly from the waters of Northern New York than any other living sportsman, has been spending the winter on the Homosassa River, Florida, where he has made it exceedingly sultry for the members of the finny tribe. Mr. W., being a thorough sportsman, makes it a practice to observe closely the habits of the game which he pursues, and became convinced, from various indications, that the alligator was a true game fish and could be taken with the fly, providing the proper tackle were used. Consequently he set himself to work with all the ardor which distinguishes the explorer in a new field to prepare himself for this Gargantuan sport. Tying a horse-tail hackle, with coot wings, on a shark hook, he attached to it a five-foot leader of annealed iron wire, in links, and this again to a fine cable-laid salmon line, made of the best Russian hemp. With this apparatus and a springy red cedar rod of some five or six lbs. weight, such as few but the Douglas himself could wield. Mr. W. fished two days, and near the close of the second was rewarded by the capture of an immense saurian, measuring eleven feet nine inches in length.—*Rod and Gun.*

THE LONG ISLAND YACHT CLUB.—The Long Island Yacht Club held their annual meeting at the club rooms, foot of Thirty-seventh Street, Brooklyn, on last Thursday evening, and elected the following officers: Commodore, R. W. Holmes, schooner yacht Playful; Vice-Commodore, Frank Beames, sloop yacht Marie; President, Reuben Crelmer; Secretary, A. F. Miller; Treasurer, Frank Bates; Measurer, George Crolius. A resolution was adopted appropriating $50 for a prize for a Corinthian race for cabin sloops. The day for this and for the annual regatta will be fixed at the next meeting.

THE AMARYLLIS.—This remarkable craft, modeled after the double canoes of the South Sea Islands, arrived at Brooklyn last week, where she has been visited by crowds of curious people. It will be remembered that the Amaryllis was the craft which beat all the yachts so badly during the Centennial regatta in our bay last summer. Mr. Nathaniel G. Herreshoff, her owner, has made a match against time for $500, to start from Bates' and sail to Greenport, L. I., in eight hours. The distance is 140 miles by water. Her owner is confident he can do it without difficulty.

—The Brooklyn Yacht Club house, now situated at Gravesend Bay, is shortly to be removed to Bay Ridge, where a suitable site has been selected. The old location was inaccessible to any members but those owning yachts, and had become very unpopular.

—Mr. R. W. Holmes, owner of the schooner yacht Playful, is willing to match his boat against any schooner in the United States or Canada for a cup of the value of $1,000, to sail twenty miles to leeward. Mr. Holmes is of the opinion that, with a smooth bottom and good crew, the Playful can beat anything that floats twenty miles before the wind. It is rumored in yachting circles that Mr. Holmes' challenge will shortly be accepted.

—The Analostan Boat Club of Washington has accepted a challenge from the Undine Boat Club of Baltimore, Md., to row a three-mile four-oared shell race on the Potomac River. The race will take place on the 24th of May next, and the course will be from the foot of G street, one mile and a half down the river and return.

BOSTON YACHT CLUB.

BOSTON, April 26, 1877.

EDITOR FOREST AND STREAM.

The Boston Yacht Club held its meeting at the office of Treasurer, Augustus Rues, Esq., 15 Pemberton Square.

Daniel B. Curtis, Commodore *pro tem*, J. J. E. Rothery, and Commodore Henry J. Flint, of the Providence Yacht Club, were unanimously elected members. Commodore Flint brings his yacht Wanderer into the club. He has been very successful in the regattas of Narragansett Bay. This year the secretary was instructed to issue a club paper, a schedule showing membership, yacht roll, additions and alterations of club rules from last year, etc., instead of going to the expense of a club book, thus saving some $250. He made a good report, showing some $450 on hand from last year, and $1,000 paid in from assessments and locker rent. On motion of ex-Commodore Barnard it was voted to pay $500 on mortgage of club house. The Regatta Committee asked for an appropriation of $500 for season, and it was voted to give them $400, in view of contingencies. The first regatta will be June 7th; and an outside race, gotten up for the benefit of larger yachts. The committee are in hopes to make this very successful, and thus entice the large yachts to make a better show than ever.

This race will be followed by a series of three champion regattas, and will be very interesting. Yacht owners generally adopted the resolution of special meeting to back the regatta and house committees in their worthy work of providing club days for non-yacht owners, and thus preserving the interest and increasing the membership. It is to be hoped that class will attend with their lady friends on those days. On motion of W. F. Halsall, Esq., shifting ballast was abolished from sailing rules. On motion of Commodore F. E. Peabody, the rule to avoid collisions during racing was added to the sailing regulations. Motion: Any yacht fouling another shall be debarred from the prize.

On motion, a committee of two was chosen to take proper notice of the death of S. J. Capen, Esq. The club adjourned to meet May 30th. Yours in haste, KEDGE.

EASTERN YACHTING NOTES.

BOSTON, April 25, 1877.

EDITOR FOREST AND STREAM.

The past week has been anything but pleasant, yet, despite the gloom and rain, some thirty yachts and sail boats can be seen riding at their moorings in our beautiful Dorchester Bay. I find that small yachts are getting to be the favorites this side of the cape. Most people here prefer to be yachtsmen practically, and you will find men of means with brown hands and sunburnt visage oftener than usual. The size most preferred is about 26 feet, and the rig sloop. The shifting ballast question is also receiving its death-blow, and I am in hopes before the end of the season to see it in its winding sheet, with a round shot to sink it forever from the yachtsmen's view. A man may have a racer, but prefers to keep her a family boat to get rid of competing with the horrid idea of shifting dead weight.

I like to see all the canvas, and ideas of canvas, that can be spread to give power and speed, but when a man has got to work like a laborer for pleasure and honor then it is time to give your boat up. Yours, KEDGE.

SALEM, Mass., April 23, 1877.

EDITOR FOREST AND STREAM.

The various winter quarters of boats in this vicinity are showing signs of life. At Mr. Frisbee's yard off Derby street are various yachts, among which are the Syren, Loiterer, Wanderer, Flirt, Arrow, Rambler, Clochette, and one or two others the names of which I forget. Mr. Frisbee is building a small fishing schooner after the Swampscott Market boat model that promises well. Mr. Joshua Brown has some boats at his yard, including the Idler, and others. His schooner Alin can't be beat for a freighting schooner. Just beyond on the other shore we find a new cat-boat, built by our friend Mr. Packard, and christened the Mazeppa; she is finished finely, and her *debut* is looked for with interest. We also find Mr. Goodhue's Frolic, Mr. Martin's Clitherve, and Mr. Radford's Myrtle, all good yachts; there is also in this neighborhood a little million of whitehalls, dories and punts. Between the bridges near Beverly are several fine yachts, including the Fleur de Lis, Rebecca, Foam, Dawn, Latona, Magic, Fearless, Anna and Romance, for schooners, and the sloops Alin, Sunshine and Narragansett. There is also a fine nearly new schooner called the Rosedale, here for sale. She is a beauty, and—but I musn't covet.

Passing over the bridge to Beverly we find the Rock Brothers, who build some first-rate yachts; they make fine cat-boats. At the wharves in this town are a lot of fishing and coasting vessels, presenting a lively appearance. Proceeding to Ipswich, we find the stanch little steamer Beatrice, in a new dress of paint. This comfortable little craft plies between the towns of Ipswich and Dalis on Plum Island, and a trip on her down the Fire River with a chowder at the Bluffs is a thing not to be despised. In Mr. Dodge's boat-house, near the steamer, we find the cat-boats Transit and Vests, together with a lot of smaller crafts used on the river. Mr. Dodge has some nice little row-boats for sale at $15 each; they are very pretty and jaunty, and with good company (female, of course), one would have a jolly time in them. Mr. Dodge also builds gunning-floats, and I would recommend him to parties needing articles in his line. Our county includes some famous dory builders, Saulisbury dories being well-known among fishermen. Fine model dories are also built at Swampscott. By the way, it won't do to forget Marblehead, where there are some good yachts. At Lynn the yachts of the Lynn Yacht Club are yet in winter quarters, though showing some signs of life.

Yours, "TEAL."

(Yachting Notes continued on Page 200).

Tiffany & Co., Silversmiths, Jewelers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their timing watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. Tiffany & Co., are also the agents in America for Messrs. Patek, Philippe & Co., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Bronzes and Artistic Pottery is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. Union Square, New York Adv.

THE NEW YORK BENCH SHOW.

The following is a list of the entries in numbers received up to Saturday last, and of course does not include the English or other delayed entries.

CLASS 1.—Champion English setter dogs. Number of entries, 4.
CLASS 1.—Champion English setter bitches. Number of entries, 3.
CLASS 2.—Champion Irish setter dogs. Number of entries, 6.
CLASS 2.—Champion Irish setter bitches. Number of entries, 6.
CLASS 3.—Champion Gordon setter dogs. Number of entries, 6.
CLASS 3.—Champion Gordon setter bitches. Number of entries, 2.
CLASS 4.—Champion pointer dogs, any weight. Number of entries, 16.
CLASS 4.—Champion pointer bitches. Number of entries, 6.
CLASS 5.—Imported English setter dogs. Number of entries, 18.
CLASS 5.—Imported English setter bitches. Number of entries, 12.
CLASS 5.—Imported English setter dog puppies (under 12 months). Number of entries, 7.
CLASS 5.—Imported English setter bitch puppies (under 12 months). Number of entries, 2.
CLASS 6.—Native English setter dogs. Number of entries, 61.
CLASS 6.—Native English setter bitches. Number of entries, 19.
CLASS 6 —Native English setter dog puppies (under 12 months). Number of entries, 6.
CLASS 6.—Native English setter bitch puppies (under 12 months). Number of entries, 6.
CLASS 7.—Imported Irish setter dogs. Number of entries, 13.
CLASS 7.—Imported Irish setter bitches. Number of entries, 10.
CLASS 7.—Imported Irish setter dog puppies (under 12 months). Number of entries, 6.
CLASS 7.—Imported Irish setter bitch puppies (under 12 months). Number of entries, 7.
CLASS 8.—Native Irish setter dogs. Number of entries, 47.
CLASS 8.—Native Irish setter bitches. Number of entries, 16.
CLASS 8.—Native Irish setter dog puppies (under 12 months). Number of entries, 17.
CLASS 8.—Native Irish setter bitch puppies (under 12 months). Number of entries, 9.
CLASS 9.—Native or imported Gordon setter dogs. Number of entries, 20.
CLASS 9.—Native or imported Gordon setter bitches. Number of entries, 12.
CLASS 9.—Native or imported Gordon setter dog puppies (under 12 months). Number of entries, 7.
CLASS 9.—Native or imported Gordon setter bitch puppies (under 12 months). Number of entries, 5.
CLASS 9 A.—Native black and tan, or black, white and tan setter dogs. Number of entries, 16.
CLASS 9 A.—Native black and tan, or black, white and tan setter bitches. Number of entries, 3.
CLASS 10.—Pointer dogs over 50 pounds weight. Number of entries, 23.
CLASS 10.—Pointer bitches of 50 pounds weight or over. Number of entries, 12.
CLASS 11.—Pointer dogs under 50 pounds weight. Number of entries, 12.
CLASS 11.—Pointer bitches under 50 pounds weight. Number of entries, 17.
CLASS 12.—Pointer dog puppies (under 12 months). Number of entries, 9.
CLASS 12.—Pointer bitch puppies (under 12 months). Number of entries, 13.
CLASS 13.—Chesapeake Bay dogs (dogs or bitches). Number of entries, 1.
CLASS 14.—Irish water spaniels (dogs or bitches). Number of entries, 3.
CLASS 15.—Retrieving spaniels other than pure Irish (dogs or bitches). Number of entries, 5.
CLASS 16.—Cocker spaniels (dogs or bitches). Number of entries, 18.
CLASS 17.—Field spaniels (of any other breed), dogs or bitches. Number of entries, 9.
CLASS 18.—Fox hounds (in couples), dogs or bitches. Number of entries, 7.
CLASS 19.—Harriers in couples (dogs or bitches). Number of entries, 1.
CLASS 20.—Beagles (dog or bitch). Number of entries, 6.
CLASS 21.—Dachshunds (dog or bitch). Number of entries, 17.
CLASS 22.—Fox terriers (dog or bitch). Number of entries, 7.
CLASS 22.—Fox terrier puppies (under 12 months). Number of entries, 5.
CLASS 23.—Greyhounds (dogs or bitches). Number of entries, 16.
CLASS 24.—Staghounds (dog or bitches). Number of entries, 6.
CLASS 25.—Deerhounds (dogs or bitches). Number of entries, 6.
CLASS 26.—Mastiffs (dogs or bitches). Number of entries, 15.
CLASS 27.—St. Bernards (dogs or bitches). Number of entries, 15.
CLASS 28.—Newfoundlands (dog or bitch.) Number of entries, 10.
CLASS 29.—Siberian or Ulm dogs (dogs or bitches). Number of entries, 8.
CLASS 30.—Dalmatian or coach dogs (dogs or bitches). Number of entries, 5.
CLASS 31.—Shepherd dogs or Collies-dogs. Number of entries, 4.
CLASS 31.—Shepherd dogs or Collies-(bitches). Number of entries, 4.
CLASS 33.—Bull dogs (dog or bitch). Number of entries, 7.
CLASS 33.—Bull terriers (dog or bitch). Number of entries, 10.
CLASS 34.—Pugs (dog or bitch). Number of entries, 21.
CLASS 35.—Black and tan terriers exceeding 11 pounds weight (dog or bitch). No entries.
CLASS 36.—Black and tan terriers, not exceeding 11 pounds weight (dog or bitch). Number of entries, 12.
CLASS 37.—Skye terriers (dog or bitch). Number of entries, 20.
CLASS 38.—Scotch terriers (dog or bitch). Number of entries, 8.
CLASS 39.—Dandie Dumont terriers (dog or bitch). Number of entries, 10.
CLASS 40.—Toy terriers, not exceeding 5 pounds weight. Number of entries, 19.
CLASS 41.—Blenheim, King Charles or Japanese spaniels (dog or bitch). Number of entries, 7.
CLASS 42.—Italian greyhounds (dog or bitch). Number of entries, 6.
CLASS 43.—Poodles (dog or bitch). Number of entries, 2.
CLASS 44.—Miscellaneous (dogs or bitches). Number of entries, 6.
CLASS 45.—Trick dogs (dogs or bitches). Number of entries, 2.

SPECIALS.

No. 1.—For the best setter of any breed (dog or bitch) in the show, 46.
No. 2.—For the best pointer of any weight (dog or bitch) in the show, 26.
No. 3—For the best brace of setters of any breed (dogs or bitches, or dog and bitch); to be owned and exhibited by one person, 24.
No. 4.—For the best brace of pointers (dogs or bitches, or dog and bitch); to be owned and exhibited by one person, 10.
No. 5.—For the best collection of sporting dogs, of any kind, not less than five to be exhibited, and exhibited by one person, or from one kennel, 10.
No. 6.—For the best English setter stud dog, either native or imported, to be shown with not less than two of his get, 9.
No. 7.—For the best red Irish setter stud dog, either native or imported, to be shown with not less than two of his get, 5.
No. 8.—For the best black and tan, or black tan and white setter stud dog, either native or imported, to be shown with not less than two of his get, 3.
No. 9.—For the best pointer stud dog, over 50 pounds weight, either native or imported, to be shown with not less than two of his get, 4.
No. 10.—For the best pointer stud dog, under 50 pounds weight, either native or imported, to be shown with not less than two of his get, 3.
No. 11.—For the best English setter brood bitch, either native or imported, to be shown with not less than two of her progeny, 12.
No. 12.—For the best red Irish setter brood bitch, either native or imported, to be shown with not less than two of her progeny, 8.
No. 13.—For the best black and tan, or black tan and white setter brood bitch, either native or imported, to be shown with not less than two of her progeny, 3.
No. 14.—For the best pointer brood bitch, of any weight, to be shown with not less than two of her progeny, 5.
No. 15.—For the best English setter, dog or bitch, native bred, out of a native bitch and by an imported dog, 11.
No. 16.—For the best native English setter, dog or bitch, owned in the States of New York and New Jersey, 7.
No. 17.—For the best setter (dog or bitch), of any strain, bred in the United States, 16.
No. 18.—For the best native setter puppy (either dog or bitch), either English, Irish, or black and tan, or black tan and white, 6.
No. 19.—For the best Irish setter puppy (either dog or bitch), 8.
No. 20.—For the best pointer puppy (either dog or bitch), 8.
No. 21.—For the best native English setter puppy (dog or bitch), under 12 months of age, 8.
No. 22.—For the best display of fox hounds, to comprise not less than three couples, 1.
No. 23.—For the best cocker spaniel (dog or bitch), 7.
No. 24.—For the best skye terrier (dog or bitch), 9.
No. 25.—For pugs, 7.
No. 26.—For Gordon setter puppies, 4.

THE PICTURE GALLERY.—This promises to be a very interesting feature of the Bench Show. Already a large number of gentlemen have loaned valuable paintings, and the committee will feel greatly indebted to any others who will contribute. Messrs. Shaw Bros. have kindly offered the services of their foreman and draymen, who will collect the pictures, hang them and return them. They will be insured against fire. Mr. Lincoln can be addressed on the subject.

THE CATALOGUE.—The catalogue will be very complete, and extremely valuable as a book of reference. As there are doubtless many of our readers who would like to have them, we have made arrangements by which we can forward copies to our applicants post-paid upon receipt of the price, fifteen cents.

RAILWAY ARRANGEMENTS.—We print in this issue fac-simile copies of all the letters received from the different railways with regard to carrying dogs to and from the show free of charge, except that of the New York Central and Hudson River Railroad, which was so much blurred in going through the copying press that it was impossible to reproduce it. If any charge should be made for dogs when accompanied by their owners on this road, if reported to the Bench Show Committee, the matter will be placed before the road authorities.

—We print this week cuts of certain of the cups given as prizes at the New York Bench Show, and manufactured by Messrs. Tiffany & Co. No. 1 is Messrs. Tiffany & Co.'s cup for the best setter of any breed in the show. No. 2 is the "Spratt Patent" cup, presented through Mr. F. O. de Luze for the champion English setter. No. 3 is special prize No. 14 for the best pointer breed bitch. No. 4 is special No. 7, presented by FOREST AND STREAM for the best red Irish stud dog. No. 5 is special No. 3, presented by members of the New York City Association for the Protection of Game, for the best brace of setters. No. 6 is Mr. Dudley Olcott's cup, for the best English setter by an imported dog out of a native bitch. No. 7 is Gen. Webb's cup for the champion pointer bitch.

DEATH OF KATHLEEN.—It is with great regret that we read the death of Mr. William Jarvis' splendid red Irish setter bitch Kathleen. The sad event happened on the morning of the 27th ult. In the morning she was full of life, activity and strength, and at night she was dead. Mr. Jarvis does not state the cause of her death. We can join feelingly in his regrets, as we were to have had one of Kathleen's next litter by Elcho, but our loss is but trivial compared with his, for he loved her as the apple of his eye. Farewell, Kathleen!

A DOG STORY.—A correspondent writing from Foxburg Va., under date of April 23d, sends us the following story, for the truth of which he vouches:

"A spaniel bitch of mine had a litter of seven pups—three dogs and four bitches. Yesterday the four bitches were drowned and buried. The dam, as soon as the burying was finished, dug them up, took one pup and buried it in another place, digging a hole for it and then covering it. This she did with each pup. I never heard of such a thing before.

WM. L. F."

—Mr. Geo. G. Poyner, of Clinton, Iowa, writes us that his red Irish-Gordon bitch, Fan (formerly E. F. Stoddard's), whelped on the morning of the 20th inst. eleven fine puppies; color, red; seven dogs, four bitches; all doing well; sire, Arnold Burges' red Irish setter, Rufus.

—On April 23d Mr. L. R. Cassard's Maggie, black and tan Gordon, whelped five puppies, four dogs and one bitch, sired by Jerome's Shot. Maggie was highly commended at the Baltimore show in the very good class of Gordon bitches.

—Mr. S. B. Dilly's fine pointer bitch, Royal Fan, visited his Ranger on the 8th ult. This will bring the lady in a condition which will somewhat affect her symmetry during the bench show, but we have no doubt the judges will appreciate her condition.

—Mr. J. E. Fisher's Gordon setter bitch, Border Lily, visited Dr. H. F. Aten's Gordon dog, Glen, on the 26th and 27th ult.

CANINE-ICUS, Park Row.—What breed of dogs is a West Pointer? Ans. It is difficult to say positively; probably a strain from the original "dogs of war" that were let slip.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

W. G. M., Chattanooga, Tenn.—Your picture is an admirable representation of the clapper rail, *Rallus longirostris*. We recognized the bird at the first glance. Sorry that we can't reproduce the drawing.

E. R., Philadelphia.—Will you please let me know if there is any person in Philadelphia who gives lessons in tying or dressing flies? Ans. You can ascertain by inquiring of John Rrider, Second and Walnut streets, Mr. Thad Norris used to instruct.

CURIOUS, Fort Johnston, N. C.—In your issue of April 16th I notice that Mr. John Blakely, of Philadelphia, is reported having caught a drum-fish with rod and reel. Will you please inform me what flies, if any, were used?—Ans. Possibly Mr. Blakely will answer. We cannot.

HELL GATE, New York.—It is said that shad roe is a good bait for taking spring striped bass. Where is it to be bought, how is it used, etc.? —Ans. You can get all the shad roe you want at the markets. Put it into a strip of mosquito netting and wind it around the hook, shank and all.

JACOBUS, Frankfort, Ky.—We notice in your remarks on rifles last week you speak of Hawken's rifle. Will you oblige us with further information, as we never heard of such a gun?—Ans. Alas! we need an oracle to explain the apparent enigmas that the printers cause us to present to our readers. We wrote "Hawkins' Rifle."

R. E. S., Newark.—I am looking for a fine red Irish setter dog, pup preferred. Would the coming bench show be the place for me to look? What would be the price of such a dog three or four months old?—Ans. You will undoubtedly find one to suit you at the bench show, as there will be a large number on sale. There will also be an auction on the last day. A good puppy will cost you from $25 to $50, according to strain.

C. L. J., Philadelphia.—1st. I have a setter bitch which has constant running at the eyes. Will you please tell me in your next edition what will cure her? 2. What is the best thing I can procure to remove fleas from dogs. Ans. 1st. If there is inflammation present and the eyes bloodshot and over sensitive to light, apply the following lotion with a small sponge four or five times a day: Sulph. zinc 12 grains, wine of opium 2 drachms, distilled water enough to make 6 ounces, mix. 2d. We have found Steadman's Flea Powder to be an unfailing remedy for fleas.

A. G. N., Hoboken.—There are several of your Hoboken readers who would be pleased to hear something in regard to the fish of the Hudson, their habits, when in season, best bait and hooks to use, etc. Hope you will give us the desired information in an early number.—Ans. The fish caught in the Hudson River are shad, striped bass, tom-cods, weakfish, lafayettes, young bluefish, white perch, sturgeons, flounders eels and occasionally herrings. There are trout and pickerel in the upper stream. Hallock's forthcoming work on the Game and Fish of North America will tell you of their habits and modes of capture.

CONSTANT READER, Nashville, Tenn.—1st. Is there good hunting and trapping in Southwestern Colorado? 2d. What animals are there? 3d, Are there many streams about there? 4th. Are there any Indian reservations there? 5th. Are there many persons trapping there?—Ans. 1st. Yes, excellent hunting and fair trapping. 2d. Buffalo, antelope, red-tailed deer, mountain sheep, bears, wolves, and foxes of different varieties, jack rabbits, beavers, otters, etc., with grouse and wild fowl of many species. 3d. Yes. 4th. There is a reservation in Western Colorado of 14,734,000 acres occupied by friendly Indians, mostly of the Ute tribe. 5th. We cannot say.

J. F. B., Hackensack.—1st. After a light snow of two inches a path was observed running out from a stone wall and along parallel to it for thirty or forty yards, then across the road and along beside the wall a like distance, when it disappeared. The track was as smooth and about as large as if made by a broom-handle. It was the only mark to be seen on the snow in the morning. What made that track? 2. Do snakes ever leave their beds to pass over snow?—Ans. 1st. It would be impossible to say what it was without seeing the track. Probably it was made by one of the shrews. Their feet are so small that the footmarks might easily be overlooked. 2d. We think not.

G. H. R., Gainesville, Texas.—On the 14th I saw a red cockaded woodpecker (*P. borealis*) evidently destroying the nest of the downy woodpecker (*P. pubescens*). He was enlarging the hole so as to get into the eggs, as I supposed, from the cry of distress and the actions of the small birds. The nest was inaccessible. Is this common with that family?—Ans. We do not know that the woodpeckers are given to destroying bird's nests. Is it not probable that the *P. borealis* may have simply appropriated the nest of his smaller cousin for his own purposes, and thus not have had any direct design against its contents? We should be glad to know if the usurper bred in the hole which you saw him enlarging.

SUBSCRIBER, Philadelphia.—I have a beagle hound, five months old, that for the past two or three days has had the following symptoms: Vomiting, restlessness, lying down to go to sleep, and then, after a few moments, getting up and trying another place; he also moans (or whines), and twitches in his sleep. To-day he seems inclined to hunt up dark places, and has lost his appetite.—Ans. Your puppy probably has worms. Give him twenty grains of powdered areca nut in three doses two hours apart; three hours after the last dose give half an ounce of castor oil. If you do not find the nut in Philadelphia, you can procure it ready prepared from W. Holberton, 102 Nassau street, this city, dividing the doses he sends.

KENNEL, Westfield, Mass.—Will you please advise me what to do with the following case: Setter pup, seven months old, has a tape-worm; gave him areca nut as directed, without giving him any food. After giving him the second powder he vomited it up; two hours later gave him the third; soon after he passed about twelve feet of the worm without the head. When shall I give him areca nut again, and what shall I feed him while dosing him? Will not Rochelle salts answer as well as castor oil? Both the areca nut and castor oil seem to make him sick.—Ans. We should give him the areca nut again, but not on an empty stomach, nor yet immediately after feeding. The diet should be laxative without being too much so; say *baked* Indian meal (corn bread). You might use the Rochelle salts instead of the oil.

NEMO.—1st. What is your opinion of conical base shells? 2d. Your theory in regard to them? 3d. Do Parker or Remington make guns with two sets of barrels (10s and 12s)? 4th. Where can I procure a pup of the breed known as "Chesapeake retrievers," and cost? 5th. Is there a plant called the Cobra Head? 6th. What is the proper pronunciation of the name Jules Verne, the popular author; is it a *nom de plume*? 7th. Are the volumes of Herbert's works printed by Peterson & Bro. all bound in cloth, and can you furnish them at given price, 75 cts. per vol.?—Ans. 1st. We have never used them. 2d. That they secure more equal and rapid ignition. 3d. Yes, when so ordered. 4th. At the coming New York Bench Show. 5th. Yes. 6th. Jules Vôrne; it is not an assumed name. 7th. No; those sold at 75 cts. are bound in paper, and you will have to write to Messrs. Peterson Bros. for them.

UNDOUBTEDLY one of the best and cheapest stocks of Carpetings, Oil-Cloths, Matting, etc., etc., to be found in the United States is that of Messrs. JOHN H. PRAT, SONS & CO., Washington Street, Boston. J. W. Adams is the sportsman of the firm, and will take special pains to please any of our friends calling upon him, or with any orders sent him. It is a good, reliable house.—*Adv.*

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

NO. 103 FULTON STREET, NEW YORK.

[POST OFFICE BOX 2832.]

Twenty-five per cent. off for Clubs of Three or more

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line; outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

*** Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, MAY 3, 1877.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notices of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

☞ Trade supplied by American News Company.

CHARLES HALLOCK,
Editor and Business Manager

NOTICE.

This paper is now issued from its office at 103 Fulton street, New York.

THE "GREAT CONSOLIDATED."

TO OUR READERS.

We present to you this week the united *Forest and Stream*, and *Rod and Gun*—a consummation which we confidently believe will result advantageously alike to the paper, the reader, the advertiser, and the interests of legitimate sport in America in general. While individual effort, well directed, is potential, we believe that "a strong pull *together*" is the best calculated to produce effective results.

We are confident that under the new dispensation any projects for pleasure or profit, whether they affect the sportsman, the farmer, the game, or the dog, individually or together, whether they be to institute, acclimate, improve, or extirpate, will now be carried to a successful issue through the aid and intervention of our great and minor game associations, with which it is our purpose intimately to co-operate.

We profess to be the organ for the sportsmen of America, dating back to the spring of 1871—not a long life-time to be sure, but sufficient to give us precedence, maturity and wisdom. America, the great country of inherent sportsmen, descended from a paternity of born hunters whose childish playthings were the tools that defended their homes and supplied their larders, *needs* an organ and expositor, and we believe that our combined journal can fill the bill to general satisfaction.

Publishers of the
FOREST AND STREAM and ROD AND GUN,
The "American Sportsman's Journal."

SUBSCRIBERS AND ADVERTISERS under our new style and title are respectfully notified that in cases where the subscriptions have been paid for both journals, the joint paper will be supplied for the full term already paid for.

Our advertisers are notified that the competition between the two papers being at an end, the rates have been fixed with reference to the existing state of business; our present rates will, we trust, be satisfactory, and we shall hold to them.

It is evident that where our advertisers have been running two advertisements they will now be better served by an advertisement in the joint journal with its largely increased circulation.

GAME PROTECTION.

MASSACHUSETTS.—The following is an abstract of the game law passed at the last session of the Massachusetts Legislature:

Woodcock and partridge (ruffed grouse) may be killed between September 1st and January 1st following.

Quail may be killed between November 1st and January 1st following.

Trapping and snaring game birds prohibited entirely.

Upland plover may be killed between July 15th and January 1st following.

Wood-duck, black duck and teal may be killed between September 1st and April 15th following.

Penalty for illegal killing of woodcock, partridge, quail, upland plover, wood-duck, black duck and teal, twenty-five dollars ($25) for each bird.

Penalty for killing any undomesticated bird not before mentioned (except birds of prey, crows, crow-blackbirds, herons, bitterns, wild pigeons, jays, rail, Wilson's snipe, wild geese, plover, sandpiper, and any of the so-called marsh, beach, or shore birds), ten dollars ($10).

Penalty for destroying or disturbing the nests or eggs of any undomesticated bird (except birds of prey or crows), ten dollars ($10).

Hares, rabbits and gray squirrels may be killed between October 1st and March 1st following. Penalty for illegal taking or killing, ten dollars ($10).

No deer to be killed or taken (except one's own tame deer) until 1880. Penalty for illegal taking or killing, one hundred dollars ($100).

All forfeitures to be paid one-half to the informant or prosecutor, and one-half to the city or town where the offence is committed.

Trout and land-locked salmon may be taken by hook and line only between April 1st and October 1st following. Penalty for illegal taking, ten dollars ($10).

Black bass may be taken with hook and line only between June 1st and December 1st following. Penalty for illegal taking, twenty dollars ($20).

Possession *prima facie* evidence to convict.

NEVADA.—The last Nevada Legislature passed a game law, of which the following is a brief abstract:

SEC. 1. Protects insectivorous birds generally.

SEC. 2. Makes a close season from April 1 to September 1 for prairie-chickens, partridges, pheasants, woodcock, grouse, quail, wild-geese, wood-duck, teal, mallow, or other ducks, brant, swan, sand-hill crane, plover, curlew, robin, meadow-lark, yellow-hammer and bittern; from the first day of April to the first day of August in each year for sage-chickens and snipe.

SEC. 3. Prohibits the trapping of quail and the disturbing of nests of any birds mentioned in the Act.

SEC. 4. Makes a close season for prairie-chickens until September 1, 1879, in the Counties of Esmerelda, Douglas, Ormsby, Lyon, Storey, Churchill and Washoe.

SEC. 5. Makes a close season between January 1 and July 1 for deer, antelope, elk, mountain sheep or goat.

SEC. 6. Makes the penalty for violation of any of the provisions of the Act a sum not to exceed two hundred dollars, or imprisonment in the county jail for a term not to exceed six months.

MICHIGAN.—The annual meeting of the Michigan State Sportsmen's Association will be held at the Morton House, Grand Rapids, on Tuesday, May 8th, 1877. The meeting will be called to order at 2 P. M. All gentlemen interested in the protection of game and fish are earnestly requested to attend, whether members of the association or not.

INTERNATIONAL BRITISH CELEBRATION.—An International British Celebration, in honor of her Majesty, Queen Victoria's birthday, will be held at Petersburg, Va., on May 24th, under the immediate patronage of Lord Dufferin, Governor General of Canada, the British Minister, and a long list of Honorables. The various St. George's societies and British societies generally throughout the country are expected to participate. A full programme of the proceedings will be issued on May 1st, and can be obtained from Jno. J. Campbell, Esq., Assistant Secretary, Petersburg, Va.

A PALPABLE ERROR.—By one of those typographical errors which will sometimes occur even in the best regulated newspapers, or by a process of what Mr. Richard Grant White terms heterophemy, which we take to mean, thinking one thing and writing another, in our issue of the 19th ult. we named His Excellency Lord Dufferin, Governor General of the Dominion of Canada, as the Lieutenant-Governor of Quebec. The gentleman we should have named was His Honor, L. Letellier St. Just, Lieutenant-Governor, etc. We ask pardon for an error, which, although palpable, would yet indicate an ignorance which we repudiate.

NEW DIVERTISEMENT.—Our friend James Meyer, Esq., well known among gentlemen sportsmen, is contemplating the opening of a delightful summer resort at Pelhamville, near this city, whose pleasures will include trout fishing, as well as open-air exercise and garden luxuries. He has issued special cards of invitation to a preliminary entertainment for next Monday, May 7th. This resort is destined to become as much of an institution as Col. Kane's Pelham coach line, by which Mr. Meyer's place is readily reached. We shall say more of this hereafter.

EXPRESS.—The American Express Co. have offered to carry dogs to and from New York for the show at one-half their usual rates.

NOTICE TO SPORTSMEN.—Having received so many communications asking us for information in regard to our six-section bamboo trout, black bass, grilse and salmon rods, we have prepared a circular on the subject, which we shall take pleasure in forwarding to any address. We keep on hand all grades, the prices of which range from $15 to $150. We put our stamp only on the best, in order to protect our customers and our reputation, for we are unwilling to sell a poor rod with a false enamel (made by burning and staining, to imitate the genuine article), without letting our customers know just what they are getting.

P. O. BOX, 1,294.—*Adv.* ABBEY & IMBRIE, 48 Maiden Lane.

The Kennel.

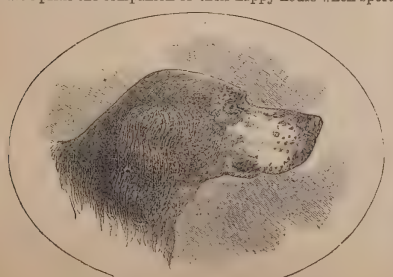
[Owing to the great interest manifested in the New York Bench Show, to be held on Tuesday, Wednesday, and Thursday next, we have devoted much of our space this week to matters pertaining to it, to the exclusion of other matter in our regular departments.—ED. F. & S.]

MR. MACDONA'S ARRIVAL.—The Rev. J. Cumming Macdona arrived from Liverpool in the White Star steamer Adriatic on Sunday last. Mr. Macdona was met at the wharf by some of the members of the Westminster Kennel Club, and escorted to the Fifth Avenue Hotel, which will be his headquarters while here. He brings with him Rover, the red Irish setter, own brother to Plunket, whose portrait appears in our present issue. Mr. G. deLandre Macdona sailed from Liverpool on the 25th ult., bringing Ranger II, Blue Prince, Magnet, a number of red Irish setter puppies, and several of his splendid St. Bernards. The same steamer brings a number of other dogs.

RANGER'S VICTORY.—We had the pleasure on the arrival of the Adriatic of handing Mr. Macdona a cable message, which, although it contained but these simple words, "Ranger has won all, Lort," was sufficient to afford the most intense gratification to the recipient. The message referred to the field trials which were run at Shrewsbury on the 25th and 26th ult., and indicated that old Ranger, Mr. Macdona's champion setter, had won all of the stakes for which he was entered. Those who have read the almost bitter controversy which has recently been renewed in the columns of the London *Field* will appreciate Mr. Macdona's elation. In the very last issue of that journal a correspondent, who has taken a prominent part in the battle, describes Ranger as a "dead dog," and says that "not even the puffing he receives can put him on his legs again." For a "dead dog" he has done some very lively work in beating in his old age the best dogs that could be brought against him. We shall look for the particulars with interest, and also for the result of the Kennel Club field trials, which were to have been run at Horseheath on the 2d and 3d inst., and in which Ranger was again to compete.

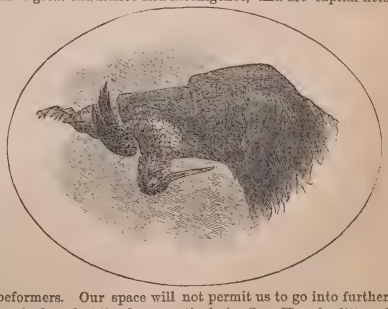
THE DOG LAW.

NEW YORK, April 20, 1877.



EDITOR FOREST AND STREAM.

The fruits of the fierce attacks made by a prominent metropolitan journal on "the noblest friend of man" is now ripe and ready to be plucked by the executioner. If this bill as passed by the Board of Aldermen becomes a law by the signature of the Mayor, it will never reach the end intended by the journal in question, for their sole war is waged against the spiteful spitz; but the law as passed by the City Fathers makes the innocent suffer for the guilty, and the latter, as will be shown, will not be incommoded in the least, nor will they help to swell the City Treasury by paying the tax imposed upon them. Dogs are rational; unfortunately, they cannot speak, or else we might learn their opinion of the madness in men; but when it comes to a question of sound sense, or horse sense, as Abe Lincoln used to call it, then we find that they are as much imbued with that desirable article as the common run of men. Everybody, no doubt, has heard of the dogs of St. Bernard and the noble Newfoundland, and where is the sportsman who will not vouch for the intelligence of the pointer and setter in the field, who understands his master's every word and action; and yet, with all this acknowledged intelligence, these common-sense dogs are to be driven mad by being deprived of their liberty and made a tow-boat of; and all for what? To please a few crusaders who have good cause to remember the spitz, for spitz is a German by word for "tight." This law, in the first place, says that every owner of a dog shall pay two dollars for a license, and one dollar for a renewal; that said dog is to wear a bell punch or collar about his royal neck, and if this was not disgrace enough, when in the street he is to be held by a chain or rope, not more than four feet in length, and a fine of three dollars can be recovered from Fido's owner if he does not carry those requisite ornaments; and lastly, the poor dog is be taken *out* to the public pound, and if not ransomed—*a la Italiano*—in forty-eight hours, he is to be dispatched with all haste to dog-heaven, from whence his spirit will hasten back to plague the inventors of such a cruel and indistinctive law. The newspaper which is entitled to all the honors in this new crusade will not obtain the object desired, for the spitz will not be touched by the rough hand of the law. How are you going to reach him? Will the brigandos climb into a lady's chamber, where the well-fed darling is reclining in safety, and snatch him out bald-headed? Not a bit of it, for there in the castle of his queen and owner broom-sticks abound, and woe be unto the man who attempts the feat! This ends the spitz, and this is just the way the tax will be collected on him. But the good dog—"the first to welcome, and foremost to defend"—must suffer or pay the tax. The latter alternative, no doubt, will be adopted by those whose hearts are as large and faithful as the dog he owns. And the collar business is grand, for the little boys of Mackerelville are waiting in anticipation of reaping a harvest, and they say "there's millions in it," while at the same time they will be aiding the City Treasury by uncollaring dogs, thereby giving the owners a chance to be fined, all of which will go into the strong box, while the dogs will be going into another kind of box. It is fair to presume that the modern Solons know the much-dreaded spitz is owned and caressed by ladies, and when the latter get their dander up the fighting along the line will be beautiful; but do they know of an instance where an intelligent dog with full liberty ever injured a child? They may, if they refresh their memory, recollect of such dogs saving life. Who makes the best watchman? A dog. Who is it that will do more for man than men will for each other—aye, even die for



CUPS PRESENTED AT THE FIRST ANNUAL NEW YORK BENCH SHOW, AND MANUFACTURED BY MESSRS. TIFFANY & CO.

him? A dog. Who was it that licked the hand of the master who slayed him, thereby showing a spirit of forgiveness rarely met with in man? A dog. There are some wise men who were never children—they happened to be born old; but then, again, thank God, there are men who can look cheerfully back to the days of their boyhood, and remember with pride the companion of their happy hours when sporting in the meadow or in the lane. Pompey, Nero, Jack or Tray was romping by his side, and ill-fared the man who dared do harm to that happy boy. Are there any such in the Board of Aldermen? If so, reconsider this bill before it becomes a law. Make a distinction between intelligence and ignorant spitefulness. Amend the law so that the spitz will and must be reached, whether in the palaces of Fifth Avenue, or the more humble abodes of Dutchtown. Do not tax, but exterminate them as a contagious evil to be dreaded. But, for mercy's sake, spare the faithful, honest friend of youth and old age, and the lips of poor children—who love their dumb friends, but have not two dollars to spare—will open with words of gladness, and rejoice in the deliverance of their speechless companions from an ungenerous and cruel, ill-timed death. There is a divinity that directs the destinies of dogs as well as men, and to those people who are in no way superstitious it may be gratifying to learn that the last official who signed the death-warrant of man's best friend did not live to see it tested, for he dropped dead out of his chair. It is to be hoped that our present worthy Mayor will not meet with any such ill-luck; and it is also to be hoped that he will not sign this bill in its present shape, but send it back from whence it came, with a veto message that will touch the tender chords in the manly bosoms of the present Board of Aldermen. X.

A Native Strain.—We give this week capital portraits of Cora and Cora II, representatives of a fine breed of native setters, owned by Messrs. Manasseh and Everett Smith of Portland, Maine. Cora, red and white, was a present from the late Cale Loring, whose name is familiar to so many of our readers; she is thirteen years old. In 1873 Cora was bred to the imported Gordon setter Grouse, a Crystal Palace winner, combining the Kent and Regent strains. Of this produce one, Guy, was almost wholly of a beautiful red color. Subsequently a red and white bitch, Hark, was bred from Grouse, and a red and white bitch named Flint. Guy and Flash were mated, and their produce was Cora II, who is of a beautiful red with scarcely any white. The dogs of this strain have great endurance and intelligence, and are capital field performers. Our space will not permit us to go into further particulars, but the dogs, particularly Cora II and a litter of puppies by Guy, will be at the Bench Show. As a purely "native" strain it is probably unexcelled.

A large number of letters from "Royal" and other correspondents are unavoidably laid over until next week.

—The cuts of the Bench Show cups, and also the reproductions of the Railway Superintendents' letters, were drawn by the Photo Plate Engraving Company, No. 63 Duane Street, this city.

—This is what the Burlington *Hawkeye* says: "Some twenty years ago a young German couple named Staninhoff came to Harrison, Wis., and a year or two afterward a child was born to them, but it was bald at birth, and up to the present time has never had a hair on its head. Since then eleven children have been born to the couple, five of whom—three boys and two girls—are perfectly bald."

Respectfully Theo N Ely Genl Manager

SPLIT BAMBOO RODS.—Conroy, Bissett & Mallison, have devoted their brains and capital to the manufacture of bamboo rods. There is an idea extant that bamboo rods are sometimes made by removing the natural enamel and substituting a fictitious article. The fact is, that the operation would not pay. Nature has done more in the matter than art can do. There is no money in it. Conroy, Bissett & Mallison are satisfied with a fair profit, and to remove that which is good for that which is coarse would be poor policy. Some manufacturers pretend to have forgotten more than other people know; but this is not the case with C., B. & M. They are satisfied to make a first-rate article, which they sell at a fair price, and for which they invite inspection, and challenge competition with any other makers in this city or elsewhere throughout the world.

IMPORTED GORDON SETTER BITCH, LOU.

ROVER.—We have reproduced from the London *Field* the portrait of Mr. Macdona's red Irish setter, Rover, own brother to Plunket. We landed Rover from the steamer on Monday, and are fain to say that he comes nearer to our idea of what an Irish setter should be, barring perhaps the white on his breast, than any dog we have seen. He is much larger than Plunket, with immense bone and power. The word "grand" expresses his general appearance better than any other. His head is simply perfect. Any gentleman who desires to see Rover before the show commences can obtain permits from Mr. Tileston at this office.

LOU.—One of our illustrations this week is a portrait of Mr. W. M. Tileston's imported Gordon setter bitch Lou, drawn by Mr. Runge (the artist who drew the dogs in the article in the April number of *Scribner's Magazine*), and engraved by Mr. McDonald. Lou was brought to this country when a puppy by Mr. H. N. Munn, who purchased her at Buxton, near the seat of the Duke of Devonshire, from a former footman of the Duke's, with whom her dam had been placed to whelp. Lou was sired by Dr. Turner's Prince. Mr. G. Lowe, Secretary to the Kennel Club, has written to Mr. Tileston that he will shortly send her complete pedigree over. With the exception of her head, which is a trifle short, Lou is probably as fine a specimen of the black and tan Gordon as can be found in the country. Her last litter all dogs, sired by Squire Smith's Monarch, turned out remarkably well. She whelped again on the 1st inst. four dogs and five bitches, all black and tan without any white, and sired by Mr. Marble's Grouse. Lou has been exhibited four times, winning first prize at Springfield, Genesee and Baltimore, and the empty honor of a Centennial medal.

MR. MACDONA'S RED IRISH SETTER, ROVER.

A CHALLENGE.—Mr. L. H. Smith of Strathroy, Canada, has published the following challenge in the Chicago *Field:*

I will show at the Westminster Kennel Club Bench Show, at Gilmore's Garden, New York, on the 8th, 9th, and 10th of May next, three braces of English setters of the Field Trial and Laverack breeds from my kennel against the same number of native English setters, to be selected by the acceptor of this challenge from the native English setter benches; no dogs having any Field Trial or Laverack blood in them to be allowed to compete on the native side.

I will name my dogs before any judging is done at the show, and the acceptor of this challenge must do the same. Should one or more of my dogs be out of condition or not be at the show, I claim the privilege of making up the number of the same blood and breeds at the show.

I will make this match for a piece of plate or any trophy the winner chooses to select, to cost $100 gold, to be paid for by the loser. The dogs to be judged collectively and by the same judge or judges as may be selected to judge the English setter class at the show; and for fear, Mr. Editor, that I may be put down as another blue blood blatant, I accompany this challenge with the needful $100 in gold, the acceptor to cover it with a like amount, and place it in your hands. The winner to receive back his money, and the trophy which shall bear a suitable inscription. This challenge to stand open till May 1st, 1877.

L. H. SMITH.

Why Mr. Smith should have selected that paper in which to make his challenge we are at a loss to imagine; but, however, by some lucky chance, it met the eye of Mr. Theodore Morford of Newton, New Jersey, who, notwithstanding the shortness of the time, has duly accepted the challenge and forwarded a deposit of $100 in gold to cover Mr. Smith's. This is a veritable trial of native against imported.

ST. BERNARDS.—Through the courtesy of the *Fancier's Gazette* we are enabled to present our readers this week with portraits of two fine St. Bernards, Monk and Hedwig III. Monk is a son of Mr. Macdona's Tiger, the winner of the first prize at Crystal Palace, 1874. His mother was imported from the Alps. "Hedwig III" came from Mr. Macdona's kennel; she is from the purest prize blood; a descendant of "Tell."

(*For other Kennel matter see Page* 195).

Yachting Notes. Continued from Page 194.

THE Eastern Yacht Club, Boston, takes the lead in Boston waters, and it is now getting in trim for a June regatta, and it is not unlikely it will indulge in a second one in September or October. With a full muster of all its craft would be some of the leading yachts in the country—such, for instance, as Lester Wallack's Columbia, Mr. Bennett's Dauntless, Commodore Kingsland's Alarm and Mr. Loubat's Enchantress. Since the close of last season there have been several changes of ownership. The schooners Ariel, Flirt, Julia and Juniata have been withdrawn; the Lydia has been changed to the Sylph; George Peabody Russell has bought the Ermongarda, which was built originally as a steamer by Poillon, of New York; C. B. Whittier has bought the Magic, and Charles H. Joy has come into possession of the schooner Rebecca. The sloops' Gauntlet, Iris and Princess have been withdrawn; W. C. Cabot, formerly owner of the Juniata, has bought the celebrated centre-board sloop Madcap of New York; David Sears has entered the Siren, and D. Brooks the Narragansett. The books of the club show the names of 333 members, 29 schooners, 12 sloops and 2 steamers.

The Boston Yacht Club, besides its annual cruise, will have a regatta in July or August. Of the old boats in the organization the schooners Elsie, Juniata and Enigma, and the sloops Gracie, Clitheroe, Leda, Pert and Ruby have been withdrawn. The Shadow has been sold by Tucker Deland to John Bryant, but will remain in the club. Besides the regular regatta there will be several races among the individual members.

THE SUBURBAN CLUBS.

The Dorchester is probably the largest and most flourishing club in this vicinity next to the two already mentioned. The following members and yachts have recently been admitted: General B. F. Butler, schooner America; Eben B. Phillips, schooner Fearless; George H. Tripp, schooner Betty; John M. Winslow, schooner Hermes; John Bryant, sloop Shadow; H. E. Hibbard, sloop Effie Mary, and George Lee, sloop Pert. The club now numbers ninety-four members. During the summer there will be a long race to Long Island Sound.

The Beverly Club, with ninety-six members and fifty-four boats, against two-thirds as many a year ago, will have two regattas in July and two in August.

The South Boston Club has increased to forty boats and nearly 200 members.

The Quincy Club, now only four years old, has sixty members and forty yachts.

The East Boston Club has largely increased during the year, and will make its displays on Decoration Day, the 17th of June, Bunker Hill Day, and the Fourth of July.

New Bedford has only just turned its attention to yachting. The club just organized embraces some of the wealthiest and most prominent men in the city.

The yacht owners in Nahant and Cohasset have organized as the Nahansett Club, and are getting ready for a lively season, as are also the members of the Lynn Yacht Club.

In Duxbury there is a lively yacht club of only a year's growth. It has sixty-five members and twenty-four yachts, and several new craft will be finished and launched before the season is over.

The Portland (Maine) Club has increased since last season from 75 140 to, and the number of yachts, which includes two steamers, from fourteen to twenty-five. The annual regatta will come off in Casco Bay on the Fourth of July.

It is quite likely that some time during the season there will be a grand ocean race at the Isle of Shoals (off Portsmouth, N. H), open to yachts from all quarters. These occasions in the past have been among the pleasantest in the annals of American yachting.

CHARLES KINGSLEY'S LOVE OF ANIMALS.—But to speak of his home without mentioning his love of animals would be to leave the picture incomplete. His dog and his horse were his frends, and they knew it, and understood his voice and eye. He was a perfect horsman, and never lost this temper with his horse, talking to and reasoning with it if it shied or bolted, as if it had been a rational being, knowing that, from the fine organization of the animal, a horse, like a child, will get confused by panic fear, which is only increased by punishment. His dog Dandy, a fine Scotch terrier, was his companion in all his parish walks, attended at the cottage lectures and school lessons, and was his and the children's friend for 13 years. He lies buried under the great fir trees on the Rectory lawn, with this inscription on his gravestones, "Fideli Fideles," and close by "Sweep," a magnificent black retriever, and "Victor," a favorite Teckel, given to him by the Queen, with which he sat up during the two last suffering nights of the little creature's life. Cats, too, were a continual delight to him; the stable had always its white cat, and the house its black or tabby, and he never tired of watching their graceful movements. His love of animals was strengthened by his belief in their future state—a belief which he held in common with John Wesley and other remarkable men. On the lawn dwelt a family of "natter jacks," (running toads,) who lived on from year to year in the same hole in the green bank, which the scythe was never allowed to approach. He had two little friends in a pair of sand wasps, who lived in a crack of the window in his dressing room, one of which he had saved from drowning in a hand-basin, taking it tenderly out into the sunshine to dry; and every Spring he would look out eagerly for them or their children, who came out of, or returned to the same crack. The little fly-catcher, who built his nest every year under his bedroom window, was a constant joy to him. He had also a favorite slow-worm in the churchyard, which his parishioners were warned not to kill, from the mistaken idea prevalent in Eversley that slow-worms were poisonous. All these tastes he encouraged in his children, teaching them to love and handle gently, without disgust, all living things, toads, frogs, beetles, as works and wonders from the hand of a living God. His guests were surprised one morning at breakfast when his little girl ran up to the open window of the dining-room, holding a long repulsive-looking worm in her hand. "Oh! daddy, look at this *delightful* worm." He had but one aversion which he could never conquer—to a spider, and it was of himself he spoke in "Glaucus," after saying "that every one seems to have his antipathic animal; I know one bred from his childhood to zoology by land and sea, and bold in asserting, and honest in feeling, that all without exception is beautiful, who yet cannot, after handling, and petting, and examining all day long every uncouth and venomous beast, avoid a paroxysm of horror at the sight of the common housespider!" But, after all, a bird, he often said, was to him the most wonderful of God's creations; he watched for the arrival of the birds of passage every spring with a strange longing, and seemed less restless after the swallow had appeared at Eversley. His eyes would fill with tears at each fresh arrival, and again each Autumn as he grieved over their departure. He knew their every note, and was never tired of watching their character and habits.—*Chas. Kingsley, His Letters and Memorials.*

PEDESTRIANS OF PAST AGES.—1688—Robert Carey, Earl of Monmouth, won £2,000 in bets by walking from London to Berwick (339½ miles) in twelve days. 1702—May 29, John Morgan, a Welshman, for a wager of 100 guineas, undertook to walk from London to Land's End, in Cornwall, and back again (612 miles) in fourteen days, which he accomplished within nine hours of the time allowed him. 1750—September 8, Pearson, a tailor, who was to walk 300 miles in Tothill Fields, Westminster, in six days, finished his journey half an hour within the time allowed him. 1759—On February 1, George Guest, of Birmingham, who had laid a considerable wager that he walked 1,000 miles in twenty-eight days, finished his journey with great ease. It seemed as if he had laid by for bets, for in the last two days he had 106 miles to walk, but walked them with so much ease to himself that, to show his agility, he walked the last six miles within an hour, though he had full six hours to do them in. 1765—In July a young woman went from Blencogo, in Scotland, to within two miles of Newcastle in one day, which is about seventy-two miles. Robert Batley, of Hutford, in Norfolk, when an old man, frequently walked from Thetford to London (81 miles) in one day, and back the next. 1774—Reed, of Hampshire, walked 100 miles in one day at Gosport; in 1787 and 1791 he walked 50 miles in little more than nine hours on the sands at Weymouth. 1787—September 27, Mr. Foster Powell, clerk to an attorney in London, walked from the Falstaff Inn, at Canterbury, to London, and back (112 miles) in 24 hours. In 1788, July 15, he walked from Hyde Park Corner to the 50 milestone at Wolverton Hill on the Bath road, and back to Hyde Park Corner in less than 22 hours. In 1790 he walked from London to York and back (400 miles) in 5 days, 16 hours and 10 minutes, having bet that he would do it in 5 days 18 hours. He afterward did the same distance in less than 5 days and 15 hours. 1786—June 17, a man, at 8 o'clock, went from Bishopsgate and walked to Colchester and back to Bishopsgate by 8 o'clock the same evening, the distance was 102 miles, and 15 guineas was betted that he did not do it in 15 hours. 1762—May 24, Child, the noted miller of Wandsworth, walked on Wimbledon Common (14 miles) in 7 hours and 57 minutes. 1788—July 20, John Batty undertook to walk 700 miles on Richmond Course in 14 days, which he performed with great ease. Mr. Batty was in the thirty-fifth year of his age. 1763—July 11, a sergeant in the Gloucester militia walked from London to Bristol in 19 hours and 35 minutes. 1790—May, Thos. Savagar, a laborer in Herefordshire, walked 404 miles in six days, over a very rough and uneven road, between Hereford and Ludlow. 1791—July, a gentleman, aged 57, walked from London to Liverpool in 4 days, which is above 50 miles a day.

THE UNION ATHLETIC CLUB, of Boston, will hold their second annual spring games on the Boston Ball Grounds, Saturday, May 25.

A NEW WAD.

THE "FISHING LINE,"
Brook Trout, Grayling, and Black Bass Fisheries
OF NORTHERN MICHIGAN, VIA
Grand Rapids and Indiana Railroad.
(Mackinaw, Grand Rapids & Cincinnati Short Line.)
Sportsmen who have cast a fly or trolled a spoon in the waters of the **Grand Traverse Region** will come again without solicitation. All other lovers of the Rod are invited to try these waters, wherein
The fish named above, as also **Muscalonge, Pike,** and **Pickerel,** abound.
In no other streams east of the Rocky Mountains is the famous **American Grayling** found in such numbers.
Brook Trout Season opens May 1st.
Grayling Season opens June 1st.
The sportsman can readily send trophies of his skill to his friends or "Club" at home, as **Ice for packing fish** can be had at many points.
Take your family with you. The scenery of the North Woods and lakes is very beautiful. The air is pure, dry, and bracing. The climate peculiarly beneficial to those suffering with hay fever and asthma.
The Hotel Accommodations, while plain, are, as a rule, good, far surpassing the average in countries new enough to afford the finest of fishing.
On and after June 1st **Round Trip Excursion Tickets** sold to **Points in Grand Traverse Region,** and attractive train facilities offered to tourists and sportsmen; also, on and after July 1st, **Mackinaw and Lake Superior** Excursion Tickets.
Dogs, Guns, and Fishing Tackle Carried Free at owner's risk,
Camp Cars for Fishing Parties and Families at low rates.
It is our aim to make sportsmen feel "at home" on this route. For Tourists' Guide, containing full information as to Hotels, Boats, Guides, &c., and accurate maps of the Fishing Grounds, send to FOREST AND STREAM office, or address

Sportsmen's Goods.

COMPLETE REVOLUTION

IN

SPORTING GUNS.

W. W. GREENER'S CHOKE-BORE GUNS have been proved by overwhelming evidence to be vastly superior to cylinder bores for all kinds of shooting, from snipe to duck. (See the Letters from Sportsmen in the London *Field*, dating from November, 1876, to March, 1877.) Dec. 9 a letter appears from F. Milbank, Esq., M. P., the finest game shot in Europe. This gentleman has killed on his own moor 760 grouse in one day. He says:

"We went out partridge shooting the last week in November. Birds are wild as hawks at this season of the year. Accompanying me were two gentlemen, both first-rate shots. All three of us had equal chances throughout the day. At the end of it one of my friends had seven brace, the other six brace, but the choke had 16½ brace. *I advisedly say the choke*, for I am convinced that the gun alone was the cause of my overtopping my friends by so large a number. I measured that day three successive shots, 63, 71, and 62 yards, and I have decided to use nothing but the choke-bore for the future, for I consider the choke-boring to be one of the greatest improvements made on the sporting gun in modern times."

The Champion Triple-Wedge Fast Gun has made the best shooting at game ever known. It will stand 10 drachms of powder in the paper shell, and can be obtained in the States at from $150 to $250.

2,000,000 service charges fired from 400,000 of these rifles at our works without accident. 20,000 rounds fired from a single gun without injury to the mechanism, or in the least impairing the accuracy of its shooting. Centennial Commission Report on Awards—Peabody-Martini Rifles: "As a military arm combining strength, simplicity, high quality of workmanship, ease of manipulation, with accuracy and rapidity of fire; using a central fire metallic cartridge, and ejecting the discharged shell unfailingly."

The Peabody-Martini Mid-Range Rifles, victorious at the Centennial Short-Range Match, at Creedmoor, Sept. 12, 1876, distance 200 yards, off-hand; 120 competitors. Members of the American and all the foreign teams participating. Only two Peabody-Martini Rifles entered, winning first prize, $160 cash and gold medal; and 4th prize, $25 cash and gold medal. Send for illustrated catalogue and price-list.

PROVIDENCE TOOL CO., PROVIDENCE, R. I., U. S. A.

Hart's Sportsman's Favorite Metallic Shells,

FOR BREECH-LOADING SHOT-GUNS.

These shells are easily loaded, and the caps easily extracted from inside. Head solid and much thicker than any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing miss-fires. The Cone is made of nickel, and fastened solid in its place. Neither rusts nor corrodes fast, like movable anvil made from steel. The Nickel Cone also prevents miss-fire when a cap has been left on shell for a few days, which is liable to occur either in steel or iron. These shells are finely finished, and made any length ordered, from 2⅜ to 3¼ inches.

Shells and Loaders and Descriptive Price-Lists can be obtained from all the leading Sportsmen's Houses throughout the country. GEORGE E. HART & CO., Newark, N. J.

From Captain Bogardus, Champion Wing Shot of America.

MESSRS. GEORGE E. HART & CO.: Gentlemen—The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly, A. H. BOGARDUS.

G. W. Simmons & Son,

32 to 38 North St., Oak Hall, Boston, Mass.

"THE BOSTON SHOOTING SUIT.—One of the most successful manufacturers of Waterproof Shooting Suits is the firm of G. W. Simmons & Son, Oak Hall, Boston. We had one of their suits on duty at Hunter's Camp at Philadelphia Centennial Exhibition It has grown gray in service, but is good for use yet. This suit is known as the 'Boston Shooting Suit,' in contradistinction no doubt, from the garments which are manufactured out west and at Washington, each of which has a local demand of its own.

The Boston Shootin Suit.'

MANUFACTURED ONLY BY

G. W. SIMMONS & SON,

Boston, Mass.

SOLD everywhere in the U. S. by all first-class dealers in

SPORTSMEN'S GOODS.

EACH GARMENT DISTINCTLY MARKED

"BOSTON SHOOTING SUIT," made by **C.W. Simmons & Son.**

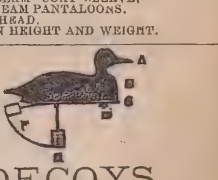
This new design of WATERPROOF SHOOTING SUIT, made from extra quality duck, has attained such popularity as to be called for from all parts of the country, and even from England.

"Shipping clothing to England strikes us very much like sending 'Coals to Newcastle,' but the merits of the "BOSTON SHOOTING SUITS" have been heard of in the Old Country, and that land of sports men has sent an order to Messrs. Simmons & Son, which will doubtless be followed by many others."—*Boston Paper.*

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is water-proofed by a new patent process. The seams and pocket corners are securely fastened, and nothing neglected to render the suit perfect in every respect.

THE PRICE HAS BEEN FIXED AT $13, TO INCLUDE HAT OR DOUBLE VISORED CAP, DETACHABLE HAVELOCK, COAT, VEST, AND PANTALOONS.



One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, waterproof quality and capacity. The coat is a marvel in this latter respect."

PERSONS ORDERING FROM A DISTANCE NEED SEND ONLY THE FOLLOWING TO BE SURE OF A PERFECT FIT:—

BREAST MEASURE.
WAIST MEASURE.
INSIDE SEAM COAT SLEEVE,
INSIDE SEAM PANTALOONS.
SIZE OF HEAD.
MENTION HEIGHT AND WEIGHT.

DECOYS.

RED HEAD.	COOT.
WHISTLER.	SPRIGTAIL.
MALLARD.	SHELDRAKE.
BLACK DUCK.	CANVAS.

ALSO WILD GEESE.

These are the new patent Decoys which come packed in nests, six in a box. The greatest improvement possible on the old style of wooden Decoy. Price of the ducks, $12 per doz.; price of the geese, $2 each. G. W. SIMMONS & SON, Oak Hall, Boston, Mass.

TRADE SUPPLIED.

FOREHAND & WADSWORTH,

Worcester, Mass.

The above cut represents our Army or Holster Revolver. The frame of the pistol is forged of the Best Cast Steel, in one piece, without hinge or joint; weight 2¼ lbs. The cylinder has six chambers using central-fire cartridges. We make them for the Colt 45-100 calibre, government size; also for the Winchester central-fire, 44-100 (model 1873). But one kind of ammunition is required for both the Winchester Rifle and this Revolver. If a lighter cartridge is desired, the Smith & Wesson Russian model cartridge will go equally as well as the Winchester, as the calibre of the chamber is suitable for each. The material in this Pistol is of the best quality, and the workmanship and finish is not surpassed by any maker. It is the most simple in construction, least complicated, and less liable to get out of order than any Holster Pistol made in the country. They are only to be compared with other arms to confirm what we say. We also make POCKET REVOLVERS DOUBLE ACTION, and the famous "TERROR," "BULL DOG" and "SWAMP ANGEL" revolvers, all of the Frames being forged from CAST STEEL.

SEND FOR PRICE LIST AND CIRCULAR.

New Model Breech-Loading Rifle.

REDUCTION IN PRICE TO MEET THE TIMES.

THIS IS THE "ALLEN" BREECH-LOADING RIFLE so widely known. We have Remodeled it, and make them for either Rim or Central Fire Cartridges.

We desire to call the attention of Dealers, and the sporting community to this Arm. It being one of the first Cartridge Breech-Loading Rifles invented in this country, and being so well known, it needs no special mention on our part to bring it to the notice of the public. For quality of workmanship it is not surpassed, and for accuracy of shooting, which is the paramount quality of a gun, we will challenge all other makers. We make them of the following calibres, viz: 22-100, 32-100, 38-100 and 44-100. We make a specialty in our 22-100 for gallery practice, and probably no rifle in the country can equal it for that purpose. Our prices are very low. SEND FOR ILLUSTRATED PRICE LIST AND CIRCULAR.

Address,
FOREHAND & WADSWORTH, Worcester, Mass.

"ST. LOUIS CONICAL BASE PAPER SHELL."

Having made important improvements in our Shell, we can safely recommend them as equal, if not superior, in quality to any Paper Shell manufactured in this country or in Europe.

Among the advantages claimed for these Shells, are: A saving of 25 per cent. in the use of powder; also the great decrease in recoil. The sizes made are No. 10—2½, 2¾, and 3 inches; No. 12—2½, 2¾, and 2¾ inches. Longer Shells will be made at extra cost. They are not mailable. Sample, 100, sent by express on receipt of $1.15 for No. 12; $1.30 for No. 10.

OLD CAZADOR'S DREAM.

In camp one night on a mountain top,
Some angel sent a dream to me:
I was sleeping a hunter's easy sleep
Beneath a piñon tree.
I dreamed that from a floating cloud
Fair lands were shown to me,
Lakes and rivers, plains and mountains
Such as in this world we seldom see;
Steep, wide cañons—and in every cañon
Trout streams flowing toward a quiet sea;
Groves of pine in piñon time—the nuts
Hung heavy on every tree.
A wealth of fruit on the wooded mountains,
And grass in the valleys there seemed to be.

Elk, deer, antelope, bear and buffalo
Were thick in the land, as I could see;
Trails led to every spring of water—
They looked happy and fat as they could be.
In every thicket quail were calling;
Song birds flew from tree to tree;
Wild fowl covered the lakes and rivers;
Seals were sleeping by the quiet sea.
In air, clear and bright with sunshine,
The cloud I lay on floated free,
Over a camp by a river, where I saw the spirit
Of Tejunga waiting there for me.

El Cazador.

Lake Superior in 1860.

BY ARCHER.

No. I.

To visit Lake Superior for health, I took the first step by stepping on board the steamer Illinois, at about midnight of any night you may please to select in August, 1860. In the hurry and bustle of getting on board I came so near losing my valise that I fear I lost the date, and I know I lost my patience; though I am happy to say I found the former and the latter in a few days; the date, however, being oblivious, will be better "imagined than described."

My first business on board was "to attend to business," by securing a room and passage to Marquette. From the many letters of excursionists which I have read I never could find any data on which to found a guess at the probable expense of a trip North. The fare to Marquette from Port Huron was ten dollars at this time, and I believe still remains at the same figure; I state this here lest I should be taken for a "dead head," as I have heretofore taken those letter-writing excursionists who fear to mention what the enterprising owners of boats are too stingy to pay for advertising.

Next morning at sunrise the writer might be seen—if any one looked in the right place for him—standing on the hurricane deck, trying to make discoveries. He discovered Lake Huron on one side, meeting the sky at a point he never saw before, and on the other washing a, to him, newly discovered part of Michigan, the said Michigan lying lazily along the horizon and bearing the aforesaid ablutions with becoming composure, though old Huron drifted her big waves to the work with energy, and doubtless, like good housewives in olden times, mixed sand plentifully with the liquid element. He also discovered the Illinois carrying herself steadily along northward. Many other times during the day he visited the upper deck, but nothing was to be discovered externally but the same monotony, till night shut out even that, and left the boat yet working on her pathless way. At night, however, at about 11 P. M., the boo-oo-oom and hoot-oot-hoot of the steamer's puncheon whistle gave warning of our nearing Mackinac. Here we discharged a company of travellers from Louisville, Ky., whose unaffected affability and real gentility left a blank in our cabin society. In two hours we were off again, enveloped in darkness and blankets till about 7 A. M. of the second day, when we touched at Detour, a place with a wharf and two or three houses, where boats turn to ascend the St. Marie River. After a few moments' delay we move on again and arrive at the Bruce Mines at about ten A. M. Here we remained three or four hours, while the boat discharged such immense numbers of empty whiskey barrels that one would think all the rivers of Ohio, from whence they came, must have flowed with fine whiskies if they had ever been filled. Their red and yellow ends suggested noses and eyes of corresponding colors, while their bare sides spoke of naked feet and dingy-clothed children. These barrels are brought hither to be filled with ore, which is shipped hence to England to be smelted. The principal ore obtained here is the yellow sulphuret of copper. It is intimately incorporated with the trap rock in which it is found, but is separated from it by reducing the masses in crushing mills, and then washing out the ore by processes and machinery too complicated and tedious to be described understandingly without illustrative drawings. Gray, black and purple ores of copper are also found here, but only in insignificant quantities. The gray ore is considered the richest. The miners at these mines—the Bruce and Wellington—make about forty dollars per month, and pay two dollars and a half per week for board. They are principally Highland (Scotch) and Cornish men, and seem to be very well pleased with their employers. While I and some others visited the Wellington Mine and its washing works, about half a dozen of our passengers remained on the pier fishing for black bass, which swarmed in such numbers in the bay that two of the anglers caught upward of one hundred in the course of an hour. All that I saw were of less than usual size; the local name for the bass seems to be, "gray perch." Very fine specimens of spar crystals with variegated copper ore are offered for sale by the miners, but they ask outlandish prices for them. For one specimen not more than four inches square the owner asked twelve dollars. I went on shore provided with a hammer and a basket, and secured a good load of such specimens as I thought best illustrated the geology of the place. Here I may give a practical hint to the tourist, by suggesting the previous preparation of a good, stout handbasket and a hammer of good size, say about that of a blacksmith's hand hammer, that is, provided he has not a proper geological tool. With these he can procure and carry with him many specimens for which, without them, he might long hopelessly.

At two P. M., or thereabouts, we left the bay and proceeded onward up the river; and here I am at a loss for descriptive powers by which to convey any adequate idea of the peculiar island scenery which delights, astonishes and bewilders the tourist all the way from Bruce Mines to within a few miles of the Sault. The distance is fifty miles, and throughout the passage the river is not a river, but a regular archipelago of miles in width; and the channels are so divided and sub-divided by low rocks, islets and islands, from a few feet to several miles in extent, that the observer is ever on the alert expecting to get a glance of the real shore, but just as constantly disappointed by finding, every little while, that which he supposed to be the shore resolving into more and more islands by newly-appearing channels, until at last he gives up in despair, and concludes that there is no shore at all. And even after arriving at that sage conclusion, he may entertain the delusion for a long time before it is dispelled. At length, however, when within about ten miles of the Sault, the main shore greets the eye, and soon we stop at the great raspberry-jam establishment owned by a live Yankee named Church, who, during the raspberry season, employs some three or four hundred Indians and half-breeds in gathering berries, which he manufactures into jam by the ton for the public markets of the South and East. The jam is shipped to ports on Lakes Erie and Michigan, and goes to the public tables in our hotels, saloons and steamboats. It appears to be of excellent quality, but being manufactured in such a wholesale way, the eater should not allow himself to indulge in conjectures as to the number of creeping things generally found on berries, particularly those gathered by Indians. Our Grahamite Brahmins must not indulge in nice analysis with the article. After obtaining a due share of jam, we ran up the river with renewed vigor, passing the Catholic and Baptist missions on the way. We reached the far-famed Sault before sunset, and stayed an hour, busying ourselves with examining the canal, and watching some Indians in canoes, fishing in the rapids. Since the opening of this canal the former business of the Sault has declined to a mere nothing, and the place is now a beggarly, desolate, dreary, deserted looking spot of squalor and squaws, so I shall not sully my paper by writing more of it. Just as we emerged from the canal we were struck with astonishment, admiration and awe by that incomparable display of Heaven's pyrotechny, those inexpressible splendid Northern lights, or rather the aurora borealis and australis combined, which have set half the world a-talking ever since, trying to describe, but only insulting them by vain attempts at verbal expression. While our steamer floats out on to the waves of Superior, and I sit entranced watching those splendid illuminations, I feel so much like Bayard Taylor, when in the Hasheesh dream he sailed under the vaulted heaven of rainbows, that I shall remain here until next week.

No. II.

Having regaled myself with watching the play of those magnificent illuminations referred to in No. I, I retired to No. 43, my state-room, and slept a good refreshing sleep, such as I sought on leaving Port Huron.

Early next morning, on repairing to my usual lookout, I found that, to the north, Superior's dark surface touched the sky away far off, as Huron had touched it toward the east on the first morning of my voyage. On the south, at a distance of a few miles, lay Michigan, still sleeping as before, but much increased in size: for now a line of hummocked mountains lay up against the sky, with a rich evergreen counterpane of forest covering its swelling sides down to the top of a bold ledge of buff-colored rocks, against whose wall-like sides the headlong waves spent their thundering force. This time, though the waters laved the sides of sleepy Michigan, there was no sand used in the operation. The sand was far below; for the perpendicular wall of rock ran many fathoms below the surface, and deep water is found close up to the wall. Such strokes and sounds make fit music for the sleeping monster. Then come next upon the wall the marks and flaws, like giant caricatures, which have been named the "Pictured Rocks:" and then the wall juts out at one place, and a natural channel is worn through parallel with the wall for some distance, and this is known as the Arched Rock, neither of them being very great curiosities. A few miles further and we pass to the lakeward of an island covered with a rich rug of green. We pass it at the distance of a few miles, and as we see it with its perpendicular sides of buff-colored rock, and its undulating profile stretching along against the sky, it seems so finished, so majestic, and so rich, we instinctively pronounce it Grand Island! And so it is called; no one could ever have called it by another name. It *is* a grand island, and the most worthy of its name of any island I ever saw.

Such a morning, too, as this! So fresh, so healthful, the air so pure, and atmosphere so clear, we begin to think the Lake Superior region as full of health as stories tell, and surmise that not half its praises have been sung. Indeed, had we been gifted with good lungs we might have tried a warble; but then, who knows a song befitting such a scene? The song should be new and made just for that time and place; but who could word the lines to tell its glories?

After passing Grand Island we continued our course westward parallel to the shore on our left for some distance before observing anything ahead but sky and water, as we supposed. In less than an hour, however, a distant fog, which had lain unobserved upon the water ahead, was gradually lifted like a white veil of gauze, and as it slowly curled away and its fairy folds showed themselves for an instant and melted into nothing, Keweenaw Point showed itself in the northwest, away off in the distance. First a speck, and then a low, dark line was discovered as the thin, airy fog was gently peeled from the horizon. The point thus soon showed its connection with the main on our left by the low, dark line becoming continuous between the two, and bounding the horizon on our bow. As we ploughed toward this distant line, it gradually rose higher and higher, and became a mountain chain with undulating profile like that on our left; and soon its swelling sides and shaded lines of intervening valleys stood up before us away over the field of waters.

As yet the shore and mountain sides retained their moss-like covering unbroken, and no shaven spot of field or farm, or white speck of human habitation gave signs of the white man's intrusion. The place toward which our bowsprit pointed was still and summer-like, and seemed soft beds of mossy mounds covering the distant mountain side. The captain's heavy voice breaks the stillness—"starboard a little!" and "starboard a little it is," responds the wheel. Our bows turn slightly to the left, and quick the word is heard, "Marquette! Marquette! Yes, there it is." We strain our eyes at the distant shore, and there a little spot, with a few white specks, is seen just above the water's edge, at the foot of the sunny slope: like the little white eggs of a bird's nest on a mossy bank, it nestles in the green mountain side.

Then all is stir and bustle, and persons hurry hither and thither with carpet-bags, valises and handboxes, all ready for a start. They walk nervously from one place to another on the deck, as if they were actually on shore and at their several purposes. They soon find, however, that they get along just as fast by being still, and so they seat themselves to wait; but with a fidgety patience, for they only keep still a minute, and then walk here and there again, and so kill time.

As we approach nearer, we find Marquette to be a beautiful little place, embosomed in woods, and situated immediately above the first lift of the shore upon the slope of the mountain, and flanked by hills which are spurs of the mountain, here jutting out on each side into the bay to form the harbor which opens to the east. The harbor is small,

but opens on a large bay capable of containing hundreds of vessels with tolerable security, except during a northeast blow. At such times the harbor is the only place that affords security. At the time of our entry there were some fifteen or twenty sail in, discharging freight, loading or awaiting their turn to load, etc. Here too, we found the Northern Light, one of the line boats, on her way down the lakes. At this place I took leave of the Illinois with some regret, having found the accommodations as good as I desired, and the officers polite and obliging; none more so than the captain, who, in addition to other desiderata, had the reputation of being the best sailor on the route. Here I found a fellow townsman, A—— L——, who had preceded me with an object similar to my own; so we became at once fellow sojourners, fellow sufferers, fellow seekers—in fine, by virtue of the innate royalty of the inhabitants of this country by which the order of Commoners is abolished and every man is a king, we became Fellows of the Royal Society. The meeting with A—— L—— was happy in more senses than one, for by his kind offices I was speedily installed in a comfortable room in a private boarding-house, where was obtained all the accommodations afforded by a hotel, without the style, but with much more quiet, and, as I think, comfort.

The impression made by the town was more than favorable. In truth, I never saw a cleaner, more tasteful or more orderly town of its size than Marquette. There was little or no drunkenness visible; although the town contained at this time some eighteen hundred or two thousand inhabitants, yet there were but three liquor saloons, and I saw but one intoxicated person during a stay of two weeks.

The merchants and professional men compared favorably with those of places six times its size. They were generally intelligent, active, week-day looking men, obliging, communicative, and well informed on subjects of general interest. In fact, those that it was my good fortune to meet were nearly all educated men, who could talk on more subjects than their immediate callings, and seldom distressed one by dragging in horses or politics as conversational themes.

The buildings were in general quite tasteful, and, though property was held very high, yet the grounds around private residences were not pinched up or stingy-looking. There were no shanties and nests of rottenness such as disfigure so many streets of most Michigan towns.

The mines are located in the mountains at fourteen, seventeen, and eighteen miles respectively, and are connected with the town by a railway on which the ore from them, in thousands of tons weekly, is brought in and shipped from the docks. The railway, as it enters the town, separates into three tracks, each of which is continued out for a considerable distance into the harbor on raised trestle-work, at a height of twenty feet or more above the water. The cars are dumped into slides, which conduct the ore into the holds of vessels lying alongside, and though a vessel is thus rapidly laden, yet there were from ten to thirty craft all the time waiting their turn to load. Many of the vessels bring coal, limestone, and the coarser kinds of provisions from the lower lakes as ballast; so that those articles were really cheaper than in most towns on the lower lakes. I will defer an account of the mines till next week.

No. III.

The Iron Mountain Mine, the most distant from the town, is in what is called Superior Mountain, eighteen miles from Marquette. This mine employs about one hundred men, of whom two-thirds are miners, at an average of forty dollars per month for miners and thirty for laborers. These men pay two and a quarter dollars per week for board. The principal ore at the Superior Mountain is the rock or slate ore, its average yield of pure iron being about sixty-five per cent. A mile nearer Marquette, on the railway line, is the Cleveland Mine, which employs about three-fourths as many men as the preceding. The principal ore here is also the slate, but they obtain larger quantities likewise of another kind known as mixed ore, which is more porous in appearance than the former, and has greenish streaks running through it. It is said to be more easily wrought, and quite as fine as the slate variety.

Fourteen miles from Marquette, also on the railway, is the Jackson or Sharon Company's Mine, at which what is known as hematite ore is found in nearly equal quantities with the slate. The hematite occurs in irregular, very solid lumps, varying in size from little nuggets up to masses eight or ten inches in diameter. It yields a larger percentage of iron than any other kind except what is called granular or steel ore, which is only found in small quantities. A small village called Negaunee—Go-a-head—has grown up around the Jackson Mine, and at this place the Pioneer Smelting Company's furnace and works are located. At these works they make pig and bloom iron, which is shipped from Marquette in large quantities. The flux used here is obtained from a very beautiful and rich-looking variegated marble, which is quarried from a ledge six miles nearer to Marquette, on the railway. This smelting furnace and another called the Collinsville Works, located on the Dead River, four and one-half miles northwest from Marquette, employ great numbers of men around them in chopping wood and converting it into charcoal to be used in the smelting operations. Hundreds of acres are thus stripped of their wood, but the land cleared will not pay for cultivation; so that small quantities of potatoes and oats are the only articles cultivated to an extent worthy of notice.

To the mineralogist, a never-ending series of interesting objects is presented, and on every hand are found curious and instructive specimens of various mineral varieties. At the mines are found the several varieties of iron ore, slate, granular, micaceous, hematite, banded, sulphuret, and mixed; and about half a mile north of Marquette is a vein of magnetic ore with which we amused ourselves by testing its powers upon the compass. Opposite the Cleveland Mine is a mountain bluff, two hundred feet in height, with a perpendicular face of one hundred and fifty feet on one side. This bluff is composed entirely of banded jasper and iron, interlamellated with each other in such curious zig zag and undulatory disposition and varied colors, that one never tires of admiring its beauties. South of the town are the ruins of an old mill, formerly used for sawing the marble already referred to, and for manufacturing hones from oil stone, which is found in a quarry about four miles back from the lake. Some of the hones are reported as excellent, but the business did not pay, and the works are now decaying to forgetfulness.

At the Lighthouse point, about a mile northeast from Marquette, is a place where cornelian is said to be obtained in the winter season. And all along the north side of the harbor a talcose slate may be traced, of varying quality, from nearly pure to clayey on the one hand, and ferruginous shale on the other, and from the latter to the common trap rock of the region, presenting a most interesting lesson in mineralogy and geology combined. Then at Presque Isle (almost an island), five miles northeast from the town, some of the most instructive exhibitions of Nature's workings are to be seen. The place is about a mile across, but stands up in some places nearly two hundred feet above the water, with the top overhanging the base. Mr. Whittlesey, the then sheriff of the county, who came hither from Cleveland for his health in '55, had his residence on the island peninsula, and with his family lived, like a king of the lake, alone in the forest on this immense rock. We found Mr. W—— a very gentlemanly, obliging person, who takes great pleasure in the enjoyment of others. He and his servant took us in a boat around the cliff which fronts the lake, and certainly a more imposing spectacle and instructive geological lesson than was here afforded cannot easily be obtained in a shorter time. On rowing out to a distance of eight or ten chains from the base of the cliff at its boldest front, the structure and formation of the whole become at once apparent. The trees, soil, and from fifty to one hundred feet of subjacent stratified red sandstone have been lifted up, one hundred feet or more, on the irregular, conical top of an immense volcanic rock, the whole width of the island in extent. At this, its east side, the base rock has a perpendicular front extending upward as stated, and probably an equal depth downward. The stratified rock lies upon it like a pile of boards upon a knoll, as if purposely put there to illustrate geological teachings. This rock was at one time an immense solid mass, but is now cleft in some places by subsequent volcanic action, or, possibly, by the cooling process; for it shows to the merest geological tyro that it was once a molten mass. On the north side of the island the base rock exhibits itself in the form of consolidated streams of lava radiating from the shore as hill spurs, which descend at various angles from the face of the bold shore down to and beneath the water. At this point we found further evidence of volcanic operations subsequent to those which gave the island its position and form, for veins of different minerals are here found traversing the mass. We found a very delicate vein of sulphuret of lead—galena ore—and came upon a place where a shaft and seventy thousand dollars were sunk at one time in search of copper. From the excavation we selected some specimens of yellow sulphuret of iron—"Fools' Gold—" which might readily be mistaken for copper ore. Indeed, it would appear that there was never any copper obtained in this place, notwithstanding the immense outlay. The owner of the location doubtless had employed a practical miner to explore, and when he came upon the yellow ore he pronounced it yellow sulphuret of copper, from which it is impossible to distinguish it except by chemical tests, of which the miner was evidently ignorant. Thus through the want of five dollars' worth of chemistry, they spent seventy thousand of gold.

In this immediate vicinity there is a vein of rock iron ore, and also a vein of asbestos, the material of which the ancients manufactured the indestructible or fireproof cloth in which they enveloped the bodies of their dead previous to cremation, in order to preserve their ashes. The asbestos found here, however, is of inferior quality, having but a very short fibre and being of a brownish color. The vein has been worked down so low that tourists cannot obtain any directly from it, and are obliged, if they desire specimens, to obtain in Marquette. It is said that the common red chalk of commerce can be obtained in large quantities a few miles further up the shore.

After enjoying our trip round the part of the island, or peninsula rather, which has just been described, and our *chaperon* obstinately refusing any compensation for the trouble we had given him, we returned to Marquette, well pleased with the visit to Presque Isle, and a hearty appreciation of the kindness of its occupant. He sent his boat and two servants to take us all the way back—five miles—though they had to row both going and returning. And here I may add a few words on boating and fishing, and the way to do both with the least trouble.

There are always plenty of vessels lying idle in the harbor, and from almost any of these a boat and crew can be obtained much more cheaply than from the fishermen of the town. There is some, but very poor, fishing in the harbor; the general resort, therefore, is the Chocolate, a river four miles below the town, or the lakes on the Carp River, up near the mines. To reach the latter, the angler should take an early morning train and go to Negaunee; thence it is only three miles, or from the Iron Mountain mine two miles, to one of the little lakes where *Salmo fontinalis* are obtained in great numbers. A good day's sport may be enjoyed and completed in time to return to Negaunee and take the evening train to Marquette, with an appetite quite commensurate with a good long string of the speckled edibles. I will say here, that is if the tourist is a "worm fisherman," as our half-breed calls those who angle with worms, he must provide himself with the squirmers before starting for Lake Superior, for none are to be found in this region.

Before leaving Marquette I will give you some more statistics of the town as it was in '60. I have already introduced you to all the inhabited places in the county, and now I will tell you that the whole population was at that time only about three thousand souls. There were three nice little church edifices, though but two clergymen. There was a neat frame court-house, but only two lawyers; four physicians and two drug stores; which latter struck me as a large complement for a region so vaunted for its healthfulness. Mr. Stafford, the principal druggist, and still a resident, is a regularly educated pharmacist, and is both obliging and gentlemanly to all with whom he comes in contact. Dr. Jones possessed a very fine private geological cabinet and scientific library. Although an amateur in the science, he proved a valuable acquaintance to those desiring to post up on the subject; I believe he is no longer a resident of Marquette. If Dr. Blecker is still a resident, he will be found a skillful botanist, and a willing and able assistant to any one desirous of studying the flora of the district. To the more exclusively literary tourist, the town library may be easily made accessible. I was freely offered the use of it before having been in the place twenty-four hours. Whoever selected it deserves great praise; and if in this centennial year the library has grown in proportion as it has gathered age, and all additions have been as well selected as in former days, it must be the best in the State; for at that time, both in number of volumes and the matter contained, it was far ahead of any town or city in Michigan in proportion to population.

Marquette possesses one printing-office, two foundries, one machine, three blacksmith, and three butcher shops; a bakery, one jewelry, one hardware, and three general stores, besides groceries and Yankee notion establishments. The land office of the Sault Canal Company, the railway depot, offices and shops, and the offices, warehouses and docks of the mining companies are all located here. There is also a studio of portrait and landscape oil painting and two photographers.

Now, having staid long enough here, we get aboard the Northern Light on her upward trip, and leave Marquette with well grounded fears that our lines will not fall in a pleasant places in our tour farther north. We leave between midnight and morning, and lest such ill-timed hours should grate upon the feelings of our readers with more regular habits, we will imagine ourselves in the same place again, seeking our state-rooms, and bidding each and all good night.

THE RANGELEY LAKE REGION.

BY THOMAS SEDGWICK STEELE.

(Continued from our last issue.)

CAMP KENNEBAGO, RANGELEY, Me., Sept. 14.

A angler's success in landing trout depends very frequently on the quick wits of his guide, and a blundering, stupid guide is worse than none at all, as he will lose you many a fish. We have no Indian guides at camp, so that little romance of life in the woods is all lost; but our men are principally from this immediate section of the country, who spend their winters cutting lumber, or "logging," as it is called, and their summers farming or "guiding," which latter employment they much prefer. Some of them are "mighty hunters," and have tramped these woods in all directions in search of game. The State of Maine offers ten dollars a head for all bears killed within its limits, and one of the guides last winter earned fifty dollars pursuing that exciting occupation.

Deer and caribou are to be found near camp, but the former are not so plenty as in the Adirondacks. There are also any amount of grouse and gray squirrels.

When assembled around our big camp fire the variety of hunting suits is quite noticeable. Some wear corduroy, others velveteen or moleskin, but, for the vicissitudes of a hunter's life, give me buckskin, on account of its toughness and flexibility.

One of the favorite fishing localities is Cupsuptuc Falls, some ten miles to the north from camp, on the Cupsuptuc stream. The river rises near the Canada line and flows south through dense woods, and finally empties itself into the lake bearing the same name. The falls are about three miles from its mouth and are very picturesque, with high, precipitous walls of rock on each side, and near the foot is a "jam" of logs made by the late freshets, and where the bows of two unfortunate "bateaus" can be seen protruding, relics of the log-drivers' venturesomeness.

The proportions of the large fish vary greatly. A trout over two pounds can be almost any shape, and the writer has, among a large collection, an outline of a ten-pounder which is almost as broad as it is long. To grow old gracefully is very essential to one's happiness in this life, but with a trout that idea seems to trouble his brain but little. In some the weight runs toward the head, and in others in the opposite direction, while the thickness of the back frequently makes up for the length of the fish. I have said that the color of most of these Rangeley trout always provokes our admiration, and an artist who portrays them in their most gorgeous colors must expect to stand any amount of criticism. In some of these fish the strong red or yellow color sweeps from above the lateral line, past the ventral fins, and entirely underneath, leaving none of the white which usually marks the belly of the fish, while it is not unusual to find the bright vermillion spots on the dorsal fins. The trout in the Rangeley stream are remarkable for their silvery appearance, and the flesh is frequently as white as that of shad, but there is no difference in the taste. The trout often assume a peculiar purple, and sometimes a steel-like appearance, but this is much more noticeable as they increase in size.

In order to give you items of our present daily experience at camp, I shall turn back to my diary of the past week, commencing with Sunday, September 6th, which was a clear, bright, exhilarating day, the thermometer at six A. M. indicating thirty-five degrees. We enjoyed ourselves a greater part of the day singing hymns, chatting about the religious topics of the day, and writing letters to our friends at home, informing them of our safe arrival at camp. It is generally our good fortune to have a minister in the company, and have a regular service on the Sabbath. We well remember the delightful sermon preached to us last year, by the Rev. J. H. Twichell of Hartford, and how in blue flannel shirts and hunting suits, from minister down to every member of the congregation, we participated in the services.

There is nothing like a blue flannel shirt to bring nature down to a grand level, and "biled" shirts are never allowed at this camp except it may be occasionally on Sunday.

Monday, the 7th inst., with our rods over our shoulders, we repaired to the Rangeley stream and Kennebago Rapids, but were not rewarded with the success we at first anticipated. At noon it commenced to rain, which, by the way, is the only storm we have had during our entire stay at camp. The afternoon was spent reading, sketching and telling stories of our angling experience in other parts of the country.

On Tuesday, the 8th inst., four of us arranged for a two days' expedition way back in the woods, a long distance from this permanent camp, our object being fur and feather rather than fin, although we fished all the way across the lake to our temporary camp at Stony Batter, which was the singular name of our destination. We arrived at the place at noon, had lunch, and leaving one of the guides to put up bough tents, put ourselves under the charge of another guide, loaded our rifles and shot guns, and were soon deep in the woods.

To those who are unacquainted with a bough tent or camp, I would say for their information that the following is its simple construction: Two sticks are cut, four feet high, and placed in front and notched at their extremities, at the top of which is fastened another. Then other poles some six feet long extend from these to the ground at the rear, and on them are laid boughs of pine and other trees, forming a pleasant camp in good weather, but in storms not remarkably water-proof unless some additions are made. Our beds were composed of cedar boughs (the delightful odor of which will put life into almost any one), and on these we laid our rubber and other blankets. Then placing our cooking utensils in their several places, we set up housekeeping in good earnest. Two of these huts were built, one for ourselves and the other for the guides.

But I must overtake our party back in the woods, who were searching in vain for a pond said to be located somewhere in this vicinity, where caribou and deer congregated in large numbers. For two long hours we tramped over the fallen trees, through bogs, and down the slippery rocks, crossing and recrossing caribou and deer tracks, and at one time noticed a large fresh excavation made (as our guide told us) by a bear and cubs in their search for roots. Finally

our guide climbed a tree, and in the distance discovered the pond for which we searched, the borders of which we soon reached, and peeping carefully through the high grass which lined its banks, gazed out on its placid surface. Our approach disturbed the water fowl, which, arising from the water, circled in the air above us and were soon lost from sight. The borders of the pond were very marshy, and our feet sank below the surface at every step, but dividing our party so as to command the entire pond, we threw ourselves on to our rubber blankets, cocked our rifles, and waited patiently the arrival of the caribou and deer. For six mortal hours we lay on our faces in the hot sun, hardly daring to breathe, tormented by mosquitoes and black flies (oh! how they did bite), and "the beating of our own hearts was all the sound we heard." At one time an immense beaver, which the guide said would weigh hard on to forty pounds, made his appearance on the scene and beguiled the weary hours by his pranks in the water, and then a great blue heron dropped on the sand, and standing on one leg cast dreamy, sidelong glances at our position among the weeds. I could not help "drawing a bead" on him several times, but for fear of frightening the expected deer I lowered my rifle. At one time a loud crashing of branches on my left caused my heart to give a sudden leap, as I expected the next moment to see my much-longed-for buck, but he didn't make his appearance, and we were obliged to retrace our steps to camp without him, running across on our journey an otter's trail, and shooting a rabbit which served for supper and breakfast.

How delightful was that supper at camp—the trout, rabbit, and other fare which our tramp had secured, together with the appetites to enjoy the same, made a meal "fit to set before a king."

Then, after a little exercise of hauling wood to our glorious big fire before the camp, we lay down to rest on our cedar boughs, lulled to sleep by the plaintive cry of the loons on the lake.

Wednesday morning I awoke a little before daylight, and wondered why there should be a second fire down by the lake shore, and on rubbing my eyes to assure myself I was not in the land of dreams, I discovered that a spark from our fire had been lodged in an old stump where we had stuck our fish rods, and in a few moments seventy-five dollars worth of rods would be in ashes. The time made between our camp and that burning stump would do well to go on record!

After breakfast we tramped back to the pond after caribou, but without success; and after climbing a high mountain we returned to Camp Kennebago, to find a welcome from letters and papers from our friends in civilization.

On Thursday, the 10th, a number of us rowed to Cupsuptuc Falls, a description of which I have given in a former letter, where we captured some three dozen fine trout. We shot six partridges while passing up and down the river with a small Smith and Wesson revolver, and one of our number had an accidental bath in the stream, which of course added to the day's adventures.

On Friday, the 11th inst., one of our party captured, among a large number, the following trout from a pound and upward, all of them being taken within an hour: Three trout of two pounds each, besides three of eight ounces. That day one of our number shot two plump partridges.

When we had all returned from our several expeditions at evening, and as we gathered around our evening's repast, to which I have so often alluded, one of our party, who had been so unfortunate during the day as to capture an immense sucker a foot and a half in length (the first one I ever saw in this region, by the way), arose, and in a most pathetic tone of voice, presented the aforesaid fish to our best fly-fisherman. The speech of presentation and acceptance would have done justice to any famed orator, for they moved us all to tears.

Saturday, September 12th, after breakfast, we occupied two hours in practicing with our rifles at a target six inches in diameter, and at a distance of one hundred and sixty feet we placed nine balls in the bull's-eye, which we thought was fair for amateurs. Then our party divided, some going to the lake, and others up the various streams near camp. On the lake we met Dr. Ordway and party of Boston, who had been camping for some time on the Cupsuptuc river, and had a fine lot of trout. On our return to camp at night, we found the following to be the adventures of the day:

A gentleman from Philadelphia had "struck a four-pounder" (as he should judge) at the mouth of the Rangeley River, and after a sharp battle had lost him, together with his entire "whip of flies." Another gentleman from Boston had landed a five-and-a-half pounder below the dam on the same stream, and had "a rise" also from two other trout of the same dimensions, but these he failed to "strike." Two trout, weighing each four pounds, had been captured on the Cupsuptuc Lake by an angler from New York, while two of our party from Brooklyn had taken fish on the Rangeley Lake which turned the scales at two and three-quarter pounds. There had also been fine fishing on the Kennebago River, a party capturing thirty trout, eight of which weighed from one and a half to three pounds each.

The ascent of Bald Mountain, in front of our camp, some 2,500 feet above tide-water, makes a delightful day's excursion. From its summit three and sometimes four of these six Rangeley Lakes can be seen. The average temperature of the camp the past week has been as follows: At 6 A. M., 34 degrees to 38 degrees; 1 P. M., 70 to 85 degrees; 7 P. M., 51 to 60 degrees. Temperature of the streams is 60 degrees; of the lake, twelve feet below the surface, 64 degrees.

The above is the daily routine of life at this camp, making, as you see, a great variety of pleasing incidents, and producing in itself a panacea for all ills.

(To be continued.)

For Forest and Stream.

TEXAS GOBBLERS AT "PEEP O' DAY."

WILLIAM BOUTWELL, a large stock and grain producer, living in Hunt County, Texas, not far from Dennison and the railroad, in a private letter (March 17th) among other things, says: "When I think of the pleasure it has given me and my family to read the interesting pieces we found in FOREST AND STREAM we received of you, I can find no words to express my thanks for them. They were anxiously looked for and read with delight, feeling that it was a great treat to get news of such a nature as to interest all, both old and young." * * *

Now, the truth is, Mr. Editor—and without wishing to put your extreme modesty to a blush—your paper carries joy with it wherever it goes. Especially is this the case when it finds its way into the household of an old Texan hunter, whose heart is as big as the bullocks' that cover his broad acres. He further says: "I do not know of anything that will interest you. Times are very good in Texas. We raised an abundant crop last year of corn, cotton, oats, etc. Cotton bears a good price; corn is very low for this country, and is selling at 25 to 30 cents a bushel. Our wheat crop, which is generally good, was rather light, and wheat sells at a dollar per bushel. But the best of all is that peace, harmony and kind feelings prevail throughout the whole broad State, and the people are now prosperous and happy. Immigration is pouring in like the waves of the sea from every quarter of our Union, and from abroad also; and Texas is large enough and sufficiently diversified to meet all their wants, whether it be for work, health, pleasure or sport. Our people bid all a hearty welcome—only come with honest hearts and a will to do good, not evil. We are now planting our corn, and the spring is very late. Game is plenty. I had a wild gobbler for breakfast this morning, which is nothing unusual. I can hear them a-gobbling from my house at almost any hour of the day. In the morning, just at the first crack of day, their notes are very clear and enlivening, and I love to hear them from their roost. It is more cheerful than the yell of the Indians, as it once was, but that has all passed away now; but that was exciting, too—only another kind of excitement. You must know what this is. Though game is generally plenty I do not hunt now as I used to, and so I turn this business over to the boys, 'who are fond of it.'"

Only think, Mr. Editor, of being awakened these soft and quiet mornings of a Texas March by the clear and sonorous notes of these shining gobblers, instead of the harsh and grating noise of the rusty royal dunghills! "Ye gods!" I hear you exclaim, "'tis well as it is, else no dirty types would be set by us, or notes scratched off by our friend to try and impart some little happiness to others."

I would ask the privilege of announcing to your readers that the railroad from near Houston, Texas, known as the Sunset Route, is now open to San Antonio; hence all Northern travelers may now reach this beautiful city by all rail. This very ancient and historic place—the city of the Alamo, the River and the Plain, and justly styled the "Pearl of the West"—is henceforth destined to take a prominent place, not only in Texas, but in the minds of Northern people, who will soon learn its great advantages for health, etc. This road passes through the southern tier of counties nearly, and runs almost parallel with the Gulf. All along this coast, and inland also, the game birds of the North mostly assemble to spend the autumn, winter and spring. The road runs through countless prairies and timber lands, across water-courses, etc., all of which are well and most graphically described by Col. G. H. Sweet, editor of the *Texas New Yorker*, published at No. 28 Centre street, New York city. I would recommend all persons feeling an interest in Texas to read this March number, and especially the tourist or sportsman who wishes to post himself up on good hunting grounds for the winter, etc. Lest many may not be able to do so, I will quote; but only for game, what he has to say of Colorado County: "Game is plentiful at all seasons of the year, and consists of deer, turkey, wild ducks, wild goose, mule-eared rabbits, prairie chickens, quails, many kinds of plover, snipe, coons, oppossum, the gray and cat squirrel, the wild spotted cat, and now and then a prairie wolf is found. The wild goose and duck are found in great numbers in the fall and winter. They become quite fat in the large corn and pea fields in this county, and are nice for table use. Fish abound in our rivers, creeks and lakes in great quantity and variety, and consist principally of cat, buffalo, gaspergou, trout, black bass and perch." To this list I will add the sand-hill crane, nearly all kinds of hawks, crows, owls, cranes, herons, bitterns, marsh hens, blackbirds by the thousand, etc., but not all as game birds. What applies to this county is about true for all the counties along the coast, and with some variations only for all the northerly inland counties of the State, while in the northwestward counties and among the highlands, we add the larger game, the buffalo, bear, cougar, leopard, antelope, and the lobus; and the smaller, civet cat, prairie dog, muskrat, beaver, otter, mink, etc. For five years or more this State was my common stamping ground in the saddle, and I feel at liberty to speak of almost every part of it, and with that full assurance which my observations justify.

MAJ. H. W. MERRILL.

New Rochelle, N. Y., April 9, 1877.

Fish Culture.

YOUNG SALMON ENTERING THE CONNECTICUT RIVER.—The Hartford *Post* of May 6th says: "We were shown to-day at Stevens' market a fish that looked like a trout, having the line of golden spots, but on closer examination it proved to be a young salmon. It was about nine inches long, and was caught in the large gill-nets used for taking shad at the mouth of the river, and was brought up by Clerk Silloway, of the steamer State of New York. It seems that quite a number of these young salmon have, within a few days, been caught in the nets at the mouth of the river. The meshes of these nets are large enough to permit the escape of such a fish, but these that have been caught were evidently in some way entangled in the net. They were evidently the young salmon of 1875 that were hatched in the upper waters of the river, from the spawn placed there by the Fish Commissioners, and having spent perhaps a year and a half at sea, are now returning by their unerring instinct, to the river of their birth. That they are really salmon and not trout admits of little or no question upon a careful examination, as the shape of the head and "shoulder" and the white belly sufficiently show.

THE GRAYLING.—George H. Jerome, State Fish Commissioner, has been at the headwaters of the Au Sable and Manistee Rivers to secure spawn for the State hatchery. On the 14th April, while on the Manistee, he began catching grayling, which are not found in waters of Southern Michigan. Some 225 adult grayling were removed to the State hatchery, whither it is expected to remove from 500 to 1,000 more. From one grayling there were produced 3,555 eggs. The fish after the operation weighed but nine ounces. A large one would have yielded 7,000. Heretofore the belief has been that the grayling would yield no more than the brook trout, but trout of the size of this grayling would produce but 500 eggs. The graylings were caught with a fly and are very gamey, furnishing fine sport for the fisherman. Mr. Jerome pronounces the flavor and quality of the grayling equal to the brook trout, and intends to stock three streams and lakes of Southern Michigan, a few of them having been found in the lakes, a fact hitherto unknown.

[We find the above information in a Detroit paper. It will interest our fish culturists and anglers. We shall look with interest for the results of the efforts to habilitate the grayling in Southern Michigan, and shall hope to receive full reports.—ED.]

SALMON IN NEW JERSEY.—A Belvidere correspondent says: "I notice you quote from the report of the New Jersey Fish Commissioners a statement that a three and one-half pound salmon was taken in October last in the Pequest. The report does not state this positively, and I am quite sure it is an error on the part of the person informing the Commissioners. If such was the case it would have been heard of here, at the junction of the Pequest and the Delaware. No authentic evidence has, I think, yet been produced of the return of any of the salmon placed in the Delaware; still, we are not without hope. H."

SHAD CULTURE IN CALIFORNIA.—The Vallejo *Chronicle* says: A Vallejo fisherman informs us that he had a shad in his nets the other day that would weigh at least five pounds. These fish are very plentiful, and among the fishermen not a little troublesome, for they have to return them to the water or lay themselves liable to prosecution. The fishermen say that in another year shad will be as common and as plentiful as herring.

THE TAKING OF FOOD BY FISHES.—When a fish snaps up an object it first opens its mouth and closes its gill flaps, and opens the gills when it closes the mouth. When it wishes to reject a disagreeable morsel, on the other hand, it first, with closed mouth, opens the gill slits, and enlarges the mouth-cavity, then shuts the gill slits and simultaneously opens the mouth. By narrowing the mouth-cavity throughout its length, it now forces out its contents; and in doing so, it is driven a little backward by the reaction, like a cannon when it is fired. If we think of it a little more closely, we shall see that, without the gill slits, the fish would not snap up any object, and so could not eat, because the morsel, if it got into the mouth-cavity, would, on closing the mouth, be ejected. The reason is simply this: On opening, the mouth-cavity fills with water after the manner of a pump, and the morsel is taken in through suction of the portion of water in which it floats. It can now be held fast in the mouth only if the water finds a mode of exit so narrow that the morsel cannot escape along with it. For this the mouth slit is nowise fitted, for if it be closed, so that a small morsel cannot escape by it, it affords no easy outflow for the water. But the want is fully met by its gill apparatus, which presents a double row of long, narrow slits, each of which is generally a good deal longer than the mouth slit, so that the water can readily flow away without the morsel being carried off along with it. But, again, if a fish were obliged to eject by its mouth the water it had taken up, it would be driven backward at each bite, and have to expend force wastefully in recovering its ground by swimming, which would be especially disadvantageous in flowing water. On the contrary, however, as the water flows out backward through the gill slits the fish receives each time an impulse which drives it forward, and the maintenance of its position in rapid water is thus rendered more easy. From these considerations it becomes possible to explain a number of arrangements found in aquatic animals, as compared with those that live in air. Still, regarding the finny tribes, we find remarkably large gill slits in fishes of prey; and any one who has watched a pike or a trout in pursuit of its prey will have noticed how widely it has stretched its gill slits, so as to let the water flow off as freely as possible on all sides. If this were at any moment to accumulate in the mouth-cavity, the fish's motion would be seriously compromised. It may with certainty be said that all fishes with remarkably wide gill slits hunt their prey in long pursuit. Thus, among our fresh-water predaceous fishes, the pike makes the longest pursuit and has the widest gills. As a contrast we might take the gently feeding and nibbling plant-bushes, such as barbel, carp, etc., which have narrow gill slits. A similar difference is associated with the streaming of water. As a fish always snaps with its mouth against the current, it receives more water into the mouth the more rapid the current; and, therefore, river fishes have, in general, larger gill slits than fishes which live in still water. Thus, too, may be explained the remarkable correlation between the width of the mouth slit and that of the gill slits, inasmuch as narrow-mouthed fish have narrow gill slits, and wide-mouthed fishes wide gill slits.—*Chambers' Journal.*

REBEL SHAD.—The Hudson is found to contain this year a decidedly inferior sort of shad, called "rebel shad," which are the work of the Fish Commissioners, who used herring milt to stimulate shad eggs with, at a time when they could not find enough male shad. If these inferior fish perpetuate themselves, there will have to be a State shad detective to tell the real "North River" from this counterfeit.—*Exchange.*

CONFIDENCES OF BROOK TROUT.

BELVIDERE, N. J., April 28, 1877.

EDITOR FOREST AND STREAM.

On Sunday, April 15th inst., I had a little adventure with a fourteen-inch trout which may be interesting to some of your readers. My wife and I strolled down to the trout ponds of a gentleman residing here to see the trout, and took with us some pieces of meat to feed them. The water was muddy, having been recently disturbed by a muskrat, and we could see but three or four fish in the clear water at one end of the largest pond. I threw in several pieces of the meat, and saw them jump for it, and then noticed one large one swimming nearer than the others. I then favored him with the food, and finally reached down and invited him to take a strip about an inch long from my fingers. He circled around, coming nearer and nearer, stopped close to my hand, retreated, then advanced again and quickly took the meat. This he did seven times successively, growing quite friendly, and coming up within four inches of the shore. He did not seem to be at all afraid of either myself or my wife, who was by my side. During the feeding I called the attendant to see it, and he informed me that neither the owner nor himself had ever fed any of the trout in that way. As we left we passed along an embankment overlooking the pond, and could see our friend at the same spot "asking for more." I had never fed the fish before, and had only been to see them at long intervals. Last evening I met the attendant, and asked whether he had tried the experiment. He replied that he had, but without success. So I am led to one or the other of two conclusions. There was something peculiarly seductive in your correspondent, or an unusually urgent condition of stomach in my finny friend, H.

Natural History.

ON THE PARTIAL MIGRATION OF DEER.

IN offering some observations on the above subject, I wish to state at the outset that I have no theory to advance or suggest. The causes which produce the movements of these interesting animals, which in my native State of Maine are as unerring and almost as regular as the ebbing and flowing of the sea, is to the writer the profoundest of mysteries; and although a subject of research and observation since boyhood, and a fruitful source of conversation, inquiry and wonder, no explanation has ever been given which is worthy of belief, and, indeed, the more intelligent hunters never attempt one. The observation of a recent naturalist that, "it is probably an exaggeration of the instinct to obtain food," may be regarded as an ingenious guess, but there is nothing in the movements of those in my own State to sanction such a belief, as the regions they forsake are as well calculated to furnish abundance of food as those to which they resort.

That part of Maine where the deer formerly congregated in the greatest abundance, and which might be termed, *par excellence*, the "hunting grounds" of the State, is comprised in the tract between the Penobscot and the St. Croix, from west to east, and from the latitude of Bangor to the forks of the Mattawamkeag, from south to north, a tract nearly 100 miles wide by 150 long. As the migration in the fall is always from west to east, the Penobscot River running the entire length of the State from north to south, and varying in width from a fourth to a half mile throughout the region named, offers an almost impassable barrier to the eastward migration of the deer on its western borders, being, if open, filled with "anchor ice," and if frozen, partially glare and piled high with "shelly ice," and its passage on their return in May is, if possible, still more difficult, as the river is then a turbulent and angry flood, swollen by the melting snows from the innumerable mountains among which it takes its rise, and filled with floating logs which were being driven to market by the hardy lumbermen who pass their winters in the forest which shadow its banks. Therefore, from May to December the deer on the eastern bank of the river, as compared with those on the west, were as ten to one, while from December to May this proportion was nearly reversed, so general and complete was the migration toward the eastern boundaries of the State. This migration usually began at the close of the running season, about the middle of December or a little before; but if, as was sometimes the case, heavy snows fell in November, they would take up their line of march at once. If, on the contrary, there happened an open December with not enough snow to cover the leaves till after Christmas, they did not on that account delay their annual migration, but by the middle of the month would be in the full tide of their travel "to the east." Before starting they collect in herds, varying in number from three to thirty—these representing the extremes—usually, five to seven. One reliable hunter once counted thirty-three, another thirty-two in one herd, fifteen being the greatest number the writer can lay claim to ever having seen in one "drove," as the hunters always call it. When on their migrations they invariably traveled in paths or runways, there being what might be termed "trunk lines" running parallel to each other from three to six miles apart, with numerous paths converging into them on both sides along the route. These paths, from years of use both going and returning, were nearly as well defined as an ordinary bridle path, being, where the earth was soft or scurfy, worn down several inches; the roots which crossed them being completely denuded of their bark by the sharp hoofs of the passing deer. They always traveled in single file under the guidance of a leader; a herd of does being sometimes accompanied by a buck in the first of the season, but the latter never acting as leader in such instances. This leader would frequently travel for a whole day without once leaving the path, while its followers would diverge frequently to snatch at browse without stopping in their walk. The distance they would travel in a day was surprising when viewed in connection with the short distance they usually go when feeding in their haunts; but when their extreme nimbleness and celerity of movement is considered, one will cease to wonder at their walking twenty miles, without seeming to hurry, in a short December day. The writer once struck the tracks of a drove of six deer before sunrise, after a fresh fall of snow. As scarce an hour had elapsed since the snow had ceased falling, and they had passed since that time, it seemed natural to suppose that they might be overtaken; but after following them sixteen miles as rapidly as the ground would admit without apparently being any nearer the game than at the start, the conclusion was reached that a stern chase is indeed a long one. The returning sixteen miles are well remembered as among the longest ever traveled over. It was seldom that the deer which summered on the banks of the Penobscot traveled farther east than Union River. Here they would take up their winter quarters, while those who had passed the summer there in like manner took up their line of march for the Machias River. About as many left the Union River waters as arrived there from the west, consequently their numbers were not greatly increased or diminished the year round; but on the Machias the eastern limit of their migration was about reached; beyond that it was straggling and uncertain, and their numbers during the winter season in the vicinity of the Machias waters almost surpassed belief. Frequently hunters traveling westward in their paths would meet a drove on their eastward march; then, if so fortunate as to shoot down the leader, the remainder of the herd would bound a short distance to the left and right, and stop apparently bewildered, frequently affording opportunities for several shots. The writer, in this manner, once killed four and wounded a fifth in a herd of seven, with a "double shooter" muzzle-loading rifle, without moving out of his tracks. But if they took the alarm before being seen, or any other than the leader was shot, they would make a short detour and again striking their path continue their flight along it, almost always keeping it up for hours, rendering pursuit perfectly useless.

I do not wish to be understood as implying that *all* the deer traveled from the banks of the Penobscot to those of the Union River and stopped there, and those of that river did in like manner with regard to the Machias; but only as indicating the manner in which they shifted their ground. Some would stop after traveling eight or ten miles; others, which had made their way across the Penobscot, would winter near its eastern bank, so that no section would be entirely devoid of deer. As their northern limits were approached these migratory passages grew shorter and shorter, and in the mountainous region, in the extreme northern portions of the State, where there have always been a few deer, they ceased altogether, the deer selecting favorable situations in the sheltered ravines, and remaining in the same localities the year round.

Of their returning migration it is not so easy to speak, as it took place at a time when they were out of season for the hunt, and the snow, on which their movements can be so easily traced, had mostly disappeared. Many of the does, however, returned (probably by easy stages) before dropping their fawns, as the writer has frequently caught these when but a few hours old. And by the middle of June they would all be back, bucks and does, flocking on to the meadows, which they visited daily till the latter part of July, both for the sake of the green and tender grass which they afforded, and to obtain the benefit of the breeze, which rids them of their tormentors, the mosquitoes; and here let me state that the word "meadow" in Eastern Maine is never used to denote a cultivated field, or grass sown by the hand of man, but always refers to those natural openings which abound on the streams in that part of the State, some of them seven or eight miles in length and over a mile in width, most, if not all of them, being made ages ago by beavers, and growing "blue joint" and other wild grasses; while those openings, equally numerous, which have no grass but only a carpeting of moss are called "bogs," which in my moose sketch your compositor set up as *bay*, whereof arose nonsense, as, although the moose is at home in the water and can easily swim two rods to a dog's one, he can hardly trot "on an open bay."

Of the total migration of caribou which took place in 1845, I will, time and space permitting, speak in a future number.

PENOBSCOT.

San Francisco, April 22d, 1877.

WILD GEESE IN CONFINEMENT.—Our correspondent, "Mac," writing from Portland, Maine, says, referring to the discussion in regard to the breeding of wild geese in confinement: "Your contributors, those *pro* as well as *con*, have both been right and both been wrong; that is, they have been writing at cross purposes, and a simple explanation of what each meant by *confinement* would at once have healed the breach. I do not believe that wild geese will breed *in a cage*, or have ever been known to do so; but it is indisputable that being 'pinioned' and allowed to select their own nesting place undisturbed, and in a suitable place, they breed in a domesticated state. In proof of this I will cite Mr. David Plumber of Scarboro, Me., a well known breeder of fancy pigeons, who has for years bred wild geese on his farm in the manner above indicated. And in Canada any traveler going northward, down either shore of the St. Lawrence River from Quebec, will find in the farm-yard of every third *habitant* domesticated wild geese, and they all say that there is no trouble about their breeding after they are three years old, and provided they are allowed to choose their own nesting place."

FOUR CANARIES FROM THREE EGGS.—Henry B. Ingram of Kingston states that a Port Jervis canary bird has hatched four birds from three eggs. The twins are smaller than the others, but very lively.

—Our correspondent, "Steuben," sends us the following note from Hornellsville, N. Y.:

"Bluebirds arrived March 10th, blackbirds 10th, gulls and blue crane 9th; I got a fine red-tail hawk March 9th; robins and brown thrush 19th, pewee and cat-birds 21st, shrike 29th, Wilson's snipe April 4th; not much of a flight yet."

SEA-TROUT.—"Manhatttan" writes, April 20th:

I think that most of the so-called sea trout occasionally captured in Long Island Sound had escaped from some of the ponds on Long Island and in Connecticut. Furman (at Maspeth) has lost, during the last few years, many thousand of young fry by the carrying away of dams, and it is probable that the piscicultural establishment at Wesiport, Connecticut, and other places on the Sound shore, have had many fish washed into tide-water by floods. I think it is now pretty well settled that sea trout are only the *Salmo fontinalis* temporarily luxuriating in salt water. I have caught them often in salt water estuaries of little brooks on the Long Island shore. M.

[There are no sea trout proper taken south of Cape Cod. We have heard of an isolated specimen taken near Salem, Mass., but they are not often seen south of the Bay of Fundy. Their habitat is the Canadian coast, from Nova Scotia to Labrador, up to latitude 56 degrees. The fish you refer to are the *Salmo fontinalis*, or common speckled trout. Single specimens are often taken off Cape Cod and along the coast southward to New York Bay, including Long Island. Sea trout run in schools of thousands together, and occur only during six weeks of midsummer. The common trout may be found in salt water throughout eight months of the year.—ED.]

THE CARP IN VIRGINIA.

BOWLING GREEN, Caroline Co., Va.

EDITOR FOREST AND STREAM.

In reply to an inquirer in your paper as to the carp in some of the waters of Eastern Virginia, I am glad to say they still abound in the Mattaponi and Pamunkey Rivers, and doubtless elsewhere, but whether or not they are of the same species as the English fish of the same name I cannot say. This fish come up the Mattaponi River early in January sometimes a little earlier, generally after the first spell of very cold weather. They range in length from one to two feet, and weigh from one-half to five pounds. Shape long and flattened; fins arranged somewhat like the mullet (freshwater); head and mouth are almost identical with heads and mouths of the latter; the mouth being extremely small and a sucker. They run very near the bottom, and only take food lying on the bottom. They bite at hooks baited with crumbs of bread or red worms. In taking the bait they assume a perpendicular position, as it were standing on their heads. They, unlike most migratory fish, do not ascend the stream to extreme limit before spawning, but, when the humor takes them, merely leave the deeper parts of the stream and deposit their spawn on its edges. After spawning most of them return toward salt water; some are found during the summer; they thrive in ponds, and it is believed they are not destructive to other fishes' spawn. As a food fish, they surpass any other we have in both delicacy of flavor and abundance; and if the fish law can be rendered effective, in a few years they will have become more abundant than any other of our visitors, though even now during their run they constitute for many their entire supply of fresh fish. As to the date of their appearance, our oldest inhabitant recollects they were first seen in our river about fifty-five or sixty years ago, but does not know how or by whom introduced. He thinks they never go below brackish water, which, if true, may account for their confinement to certain rivers.

"SEMI OCCASIONAL."

REMARKS.—There are several varieties of carp in Southern waters, but they are not generally esteemed for the table. It is well known that the carp is a native of Southern Europe, and its first introduction into this country is claimed to have been made in 1832 by Capt. Henry Robinson of a Havre packet, who brought over a lot which he deposited in a pond at Newburgh, on the Hudson River. Other lots, however, may have been brought to other States at an earlier date, perhaps as long ago as sixty years, as our correspondent says. During the last decade a superior variety of German carp have been brought to America and cultivated, especially in California. There are several varieties now at Druid Hill Park in Baltimore, one of which attains a maximum weight of fifteen pounds.

The observations of our correspondent are interesting and of value.—ED. F. & S.

THE FERÆ NATURÆ OF VERMONT.—R. E. R. writes from Ferrisburgh, Vt., April 28th:

Looking over the State Auditor's report of bounties paid, I note what may interest some of your readers to know, that from August 1, 1874, to July 30, 1875, bounties were paid for 39 bears and 9 lynxes. From July 31, 1875, to July 31, 1876, for 53 bears, 8 lynxes, and 1 panther. Jumping at conclusions from the statistics of the two years past, one might say that the bear product of Vermont was increasing; that some lynx are missing in the chain of feline succession here, and that Vermont is gaining importance in the world of art by producing more great *painters* than formerly, or, that our State is yearly becoming more *bear-in*. I do not know whether these conclusions would be borne out by comparisons with the reports of previous years, but if you care to know I will look up the matter. In these reports, C. M. Robbins of Hancock appears to bear off the palm as champion bear-slayer. H. N. Fitts of Wardsboro presents the Town Clerk's certificate for having given the panther fits. R. E. R.

GREEN-WINGED TEAL.

(Anas discors.)

PHILADELPHIA, April, 1877.

EDITOR FOREST AND STREAM.

This beautiful duck is one of the most gaudy plumaged species of its tribe. Its head and neck are of a rich chestnut brown; around the eye and sides of the head run a broad stripe of glossy green, passing into a bluish-black across the nape; forehead a dusky brown, and chin of the same hue; lower portion of the neck grayish-white; breast and body of the same tint, dotted with black flakes, and white crescent in front of the bend of each wing; scapulars finely banded with black and grayish-white; some of the outer scapulars and coverts are tipped with a delicate buff; speculum broad, rich green; the wing coverts a plain, grayish-brown; crissum black, with a triangular patch of buffy white on both sides; iris brown; beak dusky slate, one and one-half inches in length; feet light lead color. The female is not so bright in plumage as the male, and is rather smaller. This duck measures about fifteen inches in length, and twenty-three inches from tip to tip. They arrive here about the first week in September, and remain feeding along the shores of the Delaware until driven further south by the keen winds and frost of this latitude. They are killed in great numbers by our sportsmen from the reeds over decoys. Their food consists of wild oats and seeds, and they are considered by epicures to be one of the finest flavored ducks that swim. GEO. BOUDWIN,

Taxidermist.

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN FOR WEEK ENDING TUESDAY, MAY 1ST.—One Red-tailed Hawk (*Buteo borealis*), Vicill, presented; one Striped Hyena (*Hyæna Striata*), purchased; one King Snake (*Ophibolus boylii*), presented; three Hell Benders (*Menopoma allegheniensis*), presented; one Opossum (*Didelphys virginiana*), presented; two Striped Gophers (*Spermophilis tridecem-lineatus*), presented; two Capromys (*Capromy pelorides*), Say, born in garden; two Parakeet Cockatoos (*Calopsitta novæ hollandiæ*), presented.

DEATHS.—One Green Parakeet; one Gray Wolf; two Short-eared Owls; one muskrat; one Java Nonpareil.

ARTHUR E. BROWN, General Supt.

Woodland, Farm and Garden.

THE NEW YORK HORTICULTURAL SOCIETY.—The regular monthly meeting of this flourishing society was held May 1st at their rooms, 55 West Thirty-third Street. The president addressed the meeting on the forthcoming exhibition to be held at Gilmore's Garden, May 29th, 30th and 31st, day and evening, and hoped that exhibitors and members would make this year's exhibition even a greater success than last season's, and that it would be a credit to the society and to the city of New York. Quite a number of beautiful plants and cut flowers were exhibited, and the growing interest in horticultural matters was well seen by the number of ladies present, and the admiration expressed at the beautiful flowers presented. Mr. George Such, South Amboy, N. J., had on exhibition a beautiful assortment of orchids and azalias; Mr. Wm. Bennett, Flatbush, L. I., a very interesting and well-grown group of hot-house plants and orchids in bloom; Mr. John Bush, Tremont, received a certificate of merit for a well-bloomed plant of *Utricularia montana*, the first time exhibited in New York; from Wm. A. Burgess, Glen Cove, L. I., came an immense basket of rose-blooms in more than twelve sorts; from W. C. Wilson, Astoria, some well-grown fuchsias; from R. B. Parsons & Co., Flushing, cut-blooms of magnolias, including two new Japanese varieties; from Isaac Buchanan, Astoria, L. I., a fine lot of cut-blooms of orchids and azalias in pots; from John Henderson, Flushing, L. I., a fine collection of coleus and bronze-leaved pelargoniums, and from Peter Henderson, Jersey City, N. J., a beautiful assortment of cut-blooms of German fancy pansies. Notwithstanding the busy season with the florists, the meeting was well attended and was quite an enjoyable one.

MAGNOLIAS.

As the season advances we are apt to weary for the first flowering shrubs of spring. The pink mezereon and the golden forsythia come first, followed rapidly by the showy Chinese magnolias. This recalls the fact that neither the native nor exotic species of the magnolia are half so plentiful, either in our city yards or country grounds, as their merits deserve. Perhaps one barrier to their more extensive culture has been their high price, but this is in some measure obviated by the increase in the number of growers, tending of course to competition and lowering of price. Another obstacle to their culture is the great care necessary to make the trees live when transplanted; not that the operation is so very difficult, but certain care is necessary to success. The roots must never be allowed to become dry or in the least shrivelled during the time of removal; neither will it answer to puddle the roots, as is frequently practiced on more hardy kinds of trees. Then, again, it is not safe to plant magnolias in the fall, where the wounds made on their soft, spongy roots, are exposed to cold, wet, or frozen earth, during the long winter. But if carefully taken up, and as carefully packed in moss or some similar material while being transported to the place where they are to be set out, followed by good care in planting, there is very little danger of their dying. The Chinese species are, as a class, far more showy than our native varieties, although they do not grow so large as *M. acuminata* or *M. macrophylla*. Magnolia *Conspicua* is one of the very best of the Chinese species, its flowers being large, pure white, and appearing before it leaves out in spring, making a grand show at a season when such sights are more admired than at any other. Next comes *M. soulangeana* and *M. purpurea*, both of the same origin, the latter being more purple on the outside of the petals, and later in appearing than the former. *M. norbertiana*, another variety, has deep purple flowers, otherwise it is very similar to the parent. *M. lennè* is a comparatively new sort, with reddish flowers, often blooming freely in the fall, and promising to be of considerable value. Among our native species, *M. grandiflora*, of the Southern States, is a superb evergreen tree, not hardy in our latitude, but frequently met with in gardens in the South of England and the Southern part of the European Continent. *M. acuminata*, the cucumber tree, is quite hardy; the flowers are creamy yellow, appearing late in spring. It is an elegant, rapid growing, ornamental tree, readily propagated from seed, and is much used as a stock upon which to graft the more desirable and slower growing sorts. *M. macrophylla*, the large-leaved magnolia, though also a Southern variety is hardy here; the flowers are pure white, fragrant and very large, usually from ten to twelve inches in diameter. It is a noble, tropical-looking tree, and well worthy of culture. *M. umbrella* is something like the foregoing, but the leaves and flowers are smaller. *M. frazeri* or *auriculata*, forms a handsome tree with flowers, and is quite hardy. *M. glauca*, often called sweet bay or laurel magnolia, is very common in swampy places all through the Northern States, and is far too seldom seen in cultivation. The flowers are about two inches in diameter, pure white, and deliciously fragrant, as any one conversant with the lower part of Broadway or Fulton Street, where so many are sold daily during the summer months, can testify. It should be in every garden, and even plants taken from the swamps, if severely pruned when removed, will in time prove a joy and sweetness to the possessor during the whole summer. *M. glauca* var. *Thompsoni*, a supposed hybrid between *M. glauca* and *M. tripetala*, is equally desirable, being very like *M. glauca* in general appearance, equally fragrant, and often blooming late into the fall.

FORESTRY CIRCULAR.

To Botanists, Entomologists, and Other Observers in Natural History.

The undersigned has been appointed, under an act of the late Congress, to prepare a report upon forestry. It will be published by the General Government, under the direction of the Department of Agriculture. Many subjects of observation arise in connection with these inquiries which come within the province of students in natural history, and more especially of botanists and entomologists; and this circular is sent with the earnest request that those who receive it will communicate such answers to the following inquiries as they may be able, in the hope that by a consolidation of the data thus furnished important facts may be arrived at. In answering this circular, it will be sufficient to mention its number and the numbers prefixed to the several inquiries. Full credit will be given to the authors of any communication that may be used.

1. Name of correspondent and post-office address. Please give some account of the district reported from, mentioning the general elevation above sea-level, character of the surface, as to whether level, hilly, or mountainous, prevailing winds, annual rainfall, general character of the soil, etc.

2. What are the principal native timber trees of your vicinity? These may be mentioned in the order of relative abundance specifying those that are particularly valued for lumber, timber, fuel, or other other purposes. To aid in this inquiry, a special blank will be sent upon application.

3. Have instances been noticed in which, after a growth of timber has been destroyed, another kind has come up? If so, of what species was the former crop? and by what was it succeeded?

4. Have facts been observed in your region tending to show that forests have an effect upon the climate, and that changes follow the clearing off of woodland or the growing of trees upon lands formerly cleared?

5. What experiments have been made in your vicinity in forest planting or the introduction of new species, and what has been the result of the latter?

6. What important cases of destruction of timber from climatic causes, disease, or the effect of insect-ravages, have been observed in your vicinity? Please mention the nature and extent of such injuries if noticed. Small specimens of wood bark, or other parts injured by insects, may be sent by mail, as well as the insects themselves. The latter may often be best inclosed in vials filled with alcohol, and securely packed in tin or wooden boxes; but where the wings or other delicate parts would thus be injured, they may be pinned to a cork, fastened to the bottom of a small box, and thus sent by mail; or while still fresh, they may be folded in a piece of very thin paper, and placed in a box strong enough not to be crushed in the mail. Every specimen of insects sent should be accompanied by a statement of the time and place of collection, dates of appearance and disappearance (if periodical), the kind of trees affected, differences noticed on particular soils, or in certain situations, extent of ravages, facts concerning former appearance, measures that have been tried to prevent the damage, with the results, and such other facts as may have been observed.

Fungus growths supposed to be the cause of injury to trees may be usually determined from specimens. Many small coleoptera live upon the fungus parasites of trees, and may be easily confounded with those that actually mine under the bark in the living tissues, or perforate the wood. If there be any such growths near the part of the bark under which the specimens are collected, a specimen of it should accompany the piece of wood and bark injured by the insect.

Communications in answer to this circular should be addressed to the undersigned at Lowville, Lewis County, N. Y.

Respectfully yours, Franklin B. Hough.

April 4, 1877.

Sea and River Fishing.

FISH IN SEASON IN MAY

Trout, *Salmo fontinalis*. Salmon Trout, *Salmo confinis*.
Salmon, *Salmo salar*. Shad, *Alosa sapidissima*.
Land-locked Salmon, *Salmo sebago*.

***For trout flies in season in May see our issue of April 26th.

Fish in Market.—At this season commences the abundance and variety for which Fulton Market is noted. The past week has brought along the bluefish and sheepshead from North Carolina, and the weakfish, pompano and Spanish mackerel from Pensacola, Fla. At Blackford's we noticed a pompano weighing five and one-fourth pounds; a young salmon caught at Martha's Vineyard weighing one and three-fourths pounds, and a magnificent bass weighing fifty pounds, taken in the shad nets near Governor's Island. Our quotations are: Striped bass, 15 to 20 cents per pound; smelts, 10 cents; green, do., 15 cents; bluefish, 15 cents; salmon (frozen), 50 cents; Kennebec, 75 cents; green, do., 50 cents; mackerel, 10 to 15 cents each; shad (southern), 25 cents each; native, do., 50 cents; Connecticut River, 60 cents; white perch, 15 cents per pound; Spanish mackerel, 75 cents; green turtle, 18 cents; terrapin, $15 per dozen; frostfish, 8 cents per pound; halibut 18 cents; haddock, 8 cents; codfish, 7 cents; blackfish, 15 cents; herrings, 5 cents; flounders, 8 to 10 cents; sea bass, 20 cents; eels, 18 cents; lobsters, 10 cents; scollops, $1.50 per gallon; whitefish, 15 cents per pound; pickerel, 15 cents; salmon trout 15 cents; Long Island trout, $1; Canada do., 50 cents; hard shell crabs, $4 per 100; red snappers, 18 cents; weakfish, 18 cents; sheepshead, 25 cents, pompano, 75 cents.

—May is *par excellence* the trout fisher's month. Those who expect the cream of the season, without the vexation of black flies and mosquitos, should go to the stream at once. In many waters the first of June is too late. Do not put off your fishing until then. The trout are now in the swift running waters, eager for the pupæ and larvæ and full-blown flies that hatch at this season, and which the spring rains wash into the brooks and streams with other abundant food. They are eager, active, hungry, and cannot wait for the angler's most artistic cast. The bungler can catch them now. The streams are full—giving a good depth of water throughout; neither swollen, nor so shallow as to drive the fish to the deeper pools and basins, exposing every movement of the angler. In the cool air of May, the exercise of rambling along the streams and casting is exhilarating; the budding spring puts on its new life, and develops its verdure in shades of color most grateful to the eye; the birds are mating, and too busily engaged in nest building to be weary of human presence—so that one can easily study their habits; besides, the foliage is not so dense as to conceal them, as in summer time. There is much to be seen in the woods and fields in spring, and the young blood of the fisherman should leap in his veins as he goes forth, like the sap and the vigor that is mounting to the tree-tops and circling through every branch and twig.

This is the month, too, for land-locked salmon, next to the true salmon the most satisfying of game fish. The ice is out of the Maine lakes two weeks earlier than usual, and at Sebec and the Grand Lake streams everything is ready and awaiting the advent of the angler. Boats and guides are there. We have already feasted our eyes with the lithesome form of this beautiful fish, and tasted its toothsome flesh, and long for our old-time trips to the hills and sparkling shores of the Schoodics, but as we cannot go ourselves, we shall generously implore others to partake of these unaccustomed delights of which few persons know. Our duties demand our constant care for a month or more yet. For two long years we have been preparing a Sportsman's Gazetteer and Guide, by which both the angler and gunner may not only learn to capture every principal animal, bird and fish in North America, but we have designated over 4,000 resorts which he may visit, and having the volume before him, can make his own selection. Two hundred pages are now in type, and 400 *more* will be added early in June, by which time we hope to see the book between its covers and in the hands of every sportsman in the country. Friends, we are weary of labor, and await the coming of the end and your congratulations at our approaching relief.

In our last April number we specified the trout flies of this month. For land-locked salmon, the rayed feathers of the mallard dyed a deep yellow, and mixtures of this with black, are the most killing; also use a red body and grey hackle, and black wings with brown body; for evening mixtures of grey and black, a heavy fly rod such as is used for bass, with a good reel and a fathom and a half of gut casting line, is the tackle you need for these fish. Now, go it!

—The Blooming Grove Club House will be open for members and their guests on the 15th of May, the commencement of the trout fishing season, under the superintendence of M. Vucassovich.

—The introduction of black bass into the Connecticut River and the subsequent destruction of the young shad by them is now given as the reason for the scarcity of Connecticut shad this season.

Trouting in the Eastern Townships.—Mr. John Robinson of Montreal and a friend killed 150 fine trout in Coon's Pond, on Monday, April 30th, and the next day they took 17 large trout out of Lake Nick. Several of the last batch kicked the beam at 3 pounds each, and the majority of them were taken with the yellow May fly, though the ice had only just left the lake, and the day was cold and cloudy.

Spanshal.

Maine.—*Head of Sebec Lake, Me., April 27th.*—The fun which I had wished you to help enjoy is at its height. We arrived here at 9 A. M.; found the stream had not been fished this spring, and that the land-locked salmon had just commenced to run up stream. There have been taken to-day by our party eighteen land-locked salmon, several of the largest weighing four pounds, while about as many more have been hooked and lost by some of our party who are not acquainted with the fish. The ice broke up in the lake Thursday, at 2 P. M. A large amount of the sport for me was in hooking a three-pound fish, while sitting in a canoe all alone up the stream, where the water runs quick enough to be partly white. I had no dip-net. I held him until he was somewhat weakened, as he was out of the water several times, when suddenly the canoe broke its fastenings and down stream I went, part of the time the fish leading me, and then I the fish, until I got where I could force the canoe with one hand to the shore for the dip-net. I secured him, and he was cooked by being well seasoned and then rolled in several thicknesses of straw paper well moistened with water, and put in the ashes and coals.

Since writing you, on the 27th instant there has been taken at the mouth of the other stream at head of Sebec Lake another large lot of land-locked salmon. They were caught from under a boom of logs lying in mouth of the Wilson stream, some of them larger than those we caught April 26th. F. M. Ford.

Movements of the Fishing Fleet.—The Southern mackerel fleet are now well under way, and the prospect is considered favorable for a good spring catch. The early arrivals at New York the middle of last week landed good fares, and prices were good, considering the almost simultaneous arrivals of nine vessels on Thursday and Friday. The market opened with sales of large mackerel at 12 to 15 cents, but soon fell to 10 cts. for extra large, 8 cts. for large, 5 cts. for tinkers and 3½ cts. for flinks. These prices make a good commencement and the vessels did well on their first catch of the season. There has been another break in the market for Georges codfish, the market ruling at $4.50 per qtl., although there have been forced sales, where room was wanted, below these figures. The fleet has been considerably reduced, and are making long trips and bringing in light fares. The stock on hand is small, and with the ordinary call of former years would soon be exhausted; but there is no immediate prospect of improvement in demand or price. The number of fishing arrivals the past week has been 25, viz., 7 from the Banks and 18 from Georges. The receipts of split codfish have been 185,000 lbs. from the Banks and 216,000 lbs. from Georges. Halibut receipts 255,000 lbs.—*Cape Ann Advertiser, May 4th.*

—"Grouse" writes us from Duxbury, Mass., that the cod fishers have done remarkably well this season, averaging 10,000 pounds to a day's fishing, but prices are very low. Haddock are tolerably abundant, but no trout have been caught yet.

Connecticut.—*Hartford, May 5.*—W. H. and F. Bulkeley went to Berlin on Monday and brought home with them a string of fifty-five of the speckled beauties, which averaged about half a pound each.

—E. S. Sykes, of the firm of Sykes & Newton, and G. Welles Root, caught 154 trout Saturday, in a neighboring brook. Yet this splendid run of success was surpassed by the Bunce brothers, Frederick and Henry, one day last week, who returned from a single day's tronting with nearly 200 speckled beauties in hand.

—April 30th an elegant striped bass, weighing thirty-five pounds, was caught at Windsor Locks.

—A salmon weighing seven and one-half pounds was caught Monday night at Lyme, by Prest. Crittenden.

—The catch of shad continues limited, and the supply in market is hardly up to the demand, the prices ranging in Hartford from eighteen to twenty-two cents per pound.

T. S. S.

New York.—Henry B. Ingram of Kingston, sends the following, dated April 25th: The catch of shad, it is said, was never larger than it is this season, thanks to Seth Green's theory and practice. Freeman Preston captured an eight-pound striped bass this morning at the Steep Rocks. A Wall Street fishing party went to the Low Woods pond a-fishing on Tuesday, and returned with a fine mess of fish.

—Our correspondent, Henry B. Ingram, tells us that would-be trout fishermen had hard luck last week in the Catskills, back of Kingston, N. Y., getting nothing but chills for their trouble.

—E. B. G., of the Elmira Water Cure, writes pleasantly of an excursion to Hemlock Lake, where good fishing can be found, as well as ruffed grouse and squirrel shooting. Stop at "Boss Yauman's."

—H. C. K. of Albany sends us an account of his catching a three-and-a-half-pound fish by the tail; not an unusual circumstance, however, though awkward for both fish and fisher. K. is delighted with a new celluloid Hart reel that he uses.

—There is a hitch between the Oregon salmon canners and the fishermen which has delayed operations, and only 208 cases of the new catch has been received here. A cannery has been established at Collinsville, on the Sacramento River, which has already sent down 237 cases, each containing four dozen one pound tins. These are now being distributed among the trade, the price to be fixed hereafter. The Oregon salmon received here this season sold at $1.75; and $1.50 and $1.55 is now offered for May delivery. The Oregon canners have sold large quantities for delivery this season, and a vessel is already chartered to load from Columbia River in May. Pacific cod, 5 cents in bundles, and 7 and 7½ cents for selected lots in cases; Eastern cod, 8 cents to 8½ cents; Eastern mackerel are jobbing at $2.25 to $2.50 for No. 1 in 20-pound kits.

TO OUR CUSTOMERS AND THE PUBLIC.

The great reduction we have made this season in the prices of our Split Bamboo Rods has occasioned many inquiries to be addressed us, of which we may mention the following: "Are those rods of the same quality as those you sold us last year?" "How is it that when we last purchased you charged us $40 for a fly-trout rod, and now advertise them for $25?" etc., etc. Lacking time to reply to these individuals, we seek the aid of the press to make our explanations.

Those who are acquainted with the reputation our house has always enjoyed of furnishing first-class goods, an answer to the first query we have named would be superfluous, were it not that reports have been circulated by dealers, *not manufacturers*, who are not in a position to meet our prices from the fact that they *are* dealers and not manufacturers, that these rods are of inferior quality; that the enamel has been sacrificed to reduce cost of making, etc.

To this we most emphatically reply, that the rods we are now offering are of the very same quality, or better if possible than before; that bamboo itself is the best we have had for many years. They are made by the very same workmen; the mountings are German silver of best quality (not "brass, nickel-plated," as reported), and the fittings are perfect in every respect. In short, we will guarantee them fully equal, if not superior, to any maker. Without any exception in the matter, we challenge comparison in every particular. That this comparison may be exhaustively made, we have at our store for inspection of all who may be interested, first, the sections of bamboo in its rough state; then the strips as they are prepared ready fitted for glueing; then the joints after being glued, and finally the completed rod.

This we consider will cover all the points as to "quality," and we think even the most skeptical will be satisfied when they have examined into the matter, that our rods are as perfect as hands can make them. With respect to the second query, as to the great difference in price—of $40 last season, but $25 now—the answer is simple. We are *now manufacturers;* we pay no manufacturer's profit. All those rods are made in our shop, under the personal supervision of the firm. Dealers who charge the old high prices are obliged to do so because paying a manufacturer's profit. Their cost is more than the price we are selling at. These rods are not reduced in price, and sold at or under cost—as a "leader," as sometimes is done—to influence orders for other goods; they are sold at what we consider a fair profit, and we are satisfied with the percentage they pay us.

Of course we do not make as many dollars and cents on a rod as formerly, but our orders so far this year are ahead of our whole sales of last season. We have no reason to regret fixing the price at a figure that will place these rods in the hands of the majority of fly-fishermen. The annexed list will show the reductions we have made. We quote:

Fly-rods, 6 strip, 2 tips; now $25, formerly $40.

Fly-rods, 6 strip, 3‡ and duplicate joint; now $35, formerly $55.

Black bass rods, 6 strip, 2 tips; now $30, formerly $50.

Black bass rods, 6 strip, 3 tips and duplicate joints; now $40, formerly $65.

Salmon rods, 6 strip, 2 tips; now $50, formerly $80.

These rods are in all their parts wholly made by hand. Positively no machinery is used in any part of their construction. Send for circular. Conroy, Bisset & Malleson, 65 Fulton street, N. Y.—*Adv.*

AMATEUR CRUISING.

Continued from our issue of April 19th.

BOSTON, April 24th.

EDITOR FOREST AND STREAM:

THE 8th of July still found us at Scituate, with no prospects of getting away that day. As a change of base some one proposed taking a stroll up the shore. We cleared away the breakfast things, with considerable grumbling on the part of the cook at washing the dishes; but I might just as well tell my grievances to stone posts; it was brewing a storm that eventually broke out with mutiny on my part.

The wind was still blowing a gale from the sou'west, and as we got no tidings from John, our sixth associate, we congratulated ourselves that something delayed him as well, and we should meet at Provincetown.

"All hands tumble into the tender that is going ashore," came the word, and a lively scramble ensued for positions, as generally the last man had to work an ash breeze. I looked out for my place, and it fell to Ned to put in the artistic touches with the blades. A few minutes' pull, and we landed on the beach skirting the south side of the harbor. Making the boat fast to a large rock we climbed the bluff, and were rewarded with a grand view of Massachusetts Bay. The huge billows capped with foam broke in thundering tones on the shelving beach, each receding wave sonorous with tinkling music of pebbles rolling over each other by the force of massive water.

Did you ever feel as you stand watching Old Ocean in his might, a force you could not resist, a yearning to be braving the dangers of wind and wave? Just so were my feelings as I stood on the hill looking out to sea; far away the deep blue of the water mingled with the lighter color of the sky, and only relieved by occasional crests of white. From our starting point the shore is a continuous range of bluffs extending as far as Marshfield. On passing the second hill we descended to a splendid beach of sand, firm as a floor. Here is where the mossers have settled and moor their boats. Making the acquaintance of two very fine looking, robust men of the name of Dixon, we derived considerable information about preparing the moss, a slight inkling of which I gave you in my former letter.

They catch many blue fish off at the moorings, and occasionally a shark. During the winter months there are often vessels wrecked, and the people get many luxuries that they would otherwise go without. Not long before we arrived a bark went ashore, and almost every one for months smoked *cigars* or had *molasses* cake on the table three times a day.

As it was getting along toward noon, we concluded to give up going further, and go back by way of the town. Giving the Dixon brothers an invitation to spend the evening aboard with us, and receiving some of their moss, we parted company. Strolling along through the pleasant country seats, the green grass and tempting shade of rose-twined porches were almost too much for human nature, and when some buxom maiden presented her pleasant phiz at the open window, more than one was tempted (through curiosity) to claim acquaintance. But, thanks to an over-ruling power, we conquered the sins of the flesh and arrived at our ark. We dined sumptuously off steak, fish, and sundries.

After the dinner dishes were cleared away, we all took a hand in fixing up the boat for our intended visitors of the evening. Charlie, Ned, and I took the tender after all things were straightened, and rowed out to the mouth of the harbor to fish for cunners, and we got a nice mess for breakfast. The surf bothered us some as it broke rather spitefully outside the bar, and tumbled into the harbor in a rough chop sea. We fished until we were tired, and then rowed back to the "Josephine."

We got everything in readiness for a substantial meal, hoping the Dixon boys would put in an appearance before supper, but we did not get their company until 8 o'clock. We spent a very pleasant evening, singing songs and telling yarns, and it was after midnight when we turned in. A good night's rest, and we awoke with the lark. We bustled round to get breakfast out of the way, as the morning bade fair to give us the much-looked-for trip to the Cape. The bells were ringing 7 A. M. as we tripped the anchor and came gliding out of the harbor. As soon as we felt the long roll of the bay, a new life seemed infused into our veins. A gentle land breeze from the west southwest set us gradually toward our destination. Setting the stay-sail, the old "Josephine" began to show a "bone in her teeth." Until we made Race Point, the sail to the Cape was one of the most delightful I ever experienced. About 5 P. M. we were close to the shore, and the water looked inviting as we ran the beach as far as Long Point, the entrance to Provincetown Harbor. The sun had been pretty dazzling to the eyes all day, but we did not suffer much with the heat. We were about two miles from Long Point light, when I called attention to a bank of very black clouds gathering in the west; the wind too seemed to come in pretty hot puffs, and we began to wish we were in harbor. While the others were talking and laughing I kept my eye to windward, and soon detected the signal coming in a dark streak across the water. Calling Captain Bill's attention to it I sprang for the stay-sail sheet and cast it off just in time to save the topmast; we soon got it in and stowed away. The "Josephine" was now showing her stanchness under three lower sails; we wanted all the canvas on her we could carry, as she was hauled sharp on the wind, with a lea shore under us, and two miles to go before we could start a sheet. The water began to look ugly, and the wind kept increasing. Puff after puff would strike us, and the old boat would bury to her cabin windows under the press of sail. One heavy squall struck us, and the cockpit was filled; we slacked jib and fore sheets to let her up; and Ned and I crawled for'ard to take in the fore-sail, which we accomplished after much pulling and hauling. Even then the old tub had all she could stagger under. We were not long making the two miles, but the wind kept getting heavier, and the sea rougher.

"Take in the jib and start your main sheet," sung out Capt. Bill, as he squared away for the harbor. We went to work with a will; Charlie and the musician gave her the sheet, while Ned and I stopped down the jib. The boat was now running dead before the wind, and was rolling fearfully. At every other sea the main boom would slash into the water, requiring all the captain's attention to keep her from jibing. The run from Long Point to Commercial Wharf was all of two miles, and the spectators began to assemble on the pier as our movements attracted their attention. As we drew near, the sheltering beach to the north'ard and east'ard protected us from the sea, but did not afford much relief from the wind; so watching our chance, we luffed up under the end of the wharf and let go our 75lb anchor. The wharf sheltered us a little, but not enough to protect us from the sea. It was about 8 P. M. when we were all snug for the night. After partaking of a substantial hot supper we turned in, but not to sleep. The wind blew a gale all night, and the boat rocked and tossed us round as if we were in a churn. Often did we wish for daylight to appear. Four out of our five, felt pretty seasick, which with our fatigue of the day made us feel anything but pleasant.

KEDGE.

YACHTING NOTES.

BOSTON, May 1st.

The sloops Wayward, Starlight, Effie May, Maraquita, Sunbeam, Pacer, Eva, Rebie, Leda, Violet, Cycle, Clyde, Nattie, Chiquita, Posey, Agnes, and schooners Flyaway, Phantom, Elsie, Vanitas and Enigma, with fifteen or twenty smaller boats, are launched and are riding at their moorings in Dorchester Bay. The present week will see many more afloat, and as soon as we can get any settled weather they will all be put in fighting trim ready for the summer contests. It is one of the finest pictures I ever saw when all the moorings are occupied. About 185 yachts moor here, and most of them are painted white. As they rise and fall on the swell, they present a grand sight. Some are trimmed with gay colors at the mast-head, others have their sails furled in the neatest fashion, with every sheet and line taut, presenting to the observer a vision of symmetry and grace.

By the way a yachtman leaves his vessel you can determine his character. Some are neat almost to a fault, others have the grace that betokens a thorough seaman, while others still, I am sorry to say, neglect their boats, and show nothing but disorder. A yachtman, to be a good sailor, must have good ideas of order and fashion, because there is as much fashion in coiling ropes, furling sails, and stowing, as there is in rig or models. Be thorough, and you will be neat and pleasing; be jaunty, and you will be graceful and easy.

May 4.—Considerable talk of uniting the clubs in this section for a grand union regatta, to come off on Decoration Day, May 30th. Whether it will culminate anything extensive, remains to be seen. It is proposed to have each club stand its share of the expenses.

Mr. Gleason's catamaran has arrived, and is a curious specimen of architecture. It looks as if he had built a row boat 18 feet long by 5 feet wide, and then cut her in two, lengthwise, and finished the two boats. The straight sides form the inner portions of the raft, which is firmly braced together. The space between (four feet) is partly covered by a light platform. She is built very light and strong, and will be sloop-rigged. The port boat has two center boards in her, one forward and one aft. The starboard craft is simply an ordinary boat without the boards. She will have the patent slides on the mast and carry hollow spars. There is an extended platform carried out beyond the hull's aft, covered with wire netting. Each boat is provided with a rudder, and both are worked with one tiller. Both boats are open, being protected on the outer edges by a small, raised wash-rail to keep the water out when the lee boat is down.

—May 7th.—The past week has been of great service to the Boston yachtsmen. The pleasant weather has permitted the launching of a large number, and the moorings are rapidly filling up.

June is to be a very active month in boating and yachting matters. The Quincy Y. C. hold their first regatta June 2d. The Boston Y. C. June 7th. The Dorchester and East Boston Y. C. June 17th. The Dorchester Club make their regatta an outside race, the start to take place off Nahatan. The Silver Lake rowing regatta is to come off June 13th, if report is to be credited. All entries are free. As the prizes are very liberal, and in money, there will probably be a large attendance.

KEDGE.

DUXBURY, MASS., *May 5th.*—Several races will soon be sailed. A new club house will be completed during the present month.

Marcus Winslow's schooner yacht "Hermes," built by N. B. Watson of Kingston, has been challenged by the schooner "Scud," of Plymouth, to sail a race for $100. The arrangements will soon be completed.

GROUSE.

NEW YORK, May 5, 1877.

On Thursday, May 3d, two canoes, which are at present nameless, together with the Rambler, the Delaware and the Qui Vive No. 2, were launched upon the Passaic River at Newark. These boats are all Qui Vive build, and will weigh about 50 lbs. each. Three of them are rigged with fore-sail, main-sail and dandy; the others have no after-sail. The original Qui Vive will probably be put on the river some time this month.

MAGUA.

CARMAN ROWING ASSOCIATION.—At the last meeting of this association the following officers were elected: President, Andrew L. Soulard; Vice-President, Inott Schwarz; Captain, Alfred J. Keegan; Secretary, V. G. Andreboy; Lieutenant and Treasurer, Alanson Wilson; Coxswain, William Knapp. The association has a large, handsome boat-house, containing over $4,000 worth of boats of all descriptions. It has rowed several races and always been victorious. It intends entering a four-oared shell at the annual regatta, Greenwood Lake.

ON THE HARLEM.—Three members of the Dauntless Boat Club contended a two-mile straightaway single scull race on the Harlem River on Thursday last. The prize was a single scull shell presented by Mr. Ferris. The contestants were F. Gillelan, H. W. Peckwell, and H. W. Walter. The start (which was made fifty yards below High Bridge) was a very even one, Gillelan going in front after the first dozen strokes, and winning by five lengths. Peckwell was second, two lengths ahead of Walter. The time was 12m. 24⅘s.

—The Orion Rowing and Athletic Association of Jersey City will hold athletic games at West Side Park, Jersey City Heights, on Wednesday, May 30th, at 3 P. M. First prizes will consist of gold medals; second prizes, silver medals. The programme includes hundred-yard dash, one-mile walk, running high jump, quarter-mile run, hundred and twenty yard hurdle race, three-mile walk, half-mile run, running broad jump, one-mile run, tug of war (silver medals). Entries close May 19th, and may be addressed to David W. Lawrence, P. O. Box 2029, N. Y.

CONSUMPTION CURED.—An old physician, retired from active practice, having had placed in his hands by an East Indian missionary the formula of a simple vegetable remedy for the speedy and permanent cure of Consumption, Bronchitis, Catarrh, Asthma, and all Throat and Lung affections, also a positive and radical cure for Nervous Debility and all nervous complaints, after having thoroughly tested its wonderful curative powers in thousands of cases, feels it his duty to make it known to his suffering fellows. Actuated by this motive, and a conscientious desire to relieve human suffering, he will send, free of charge, to all who desire it, this recipe, with full directions for preparing and successfully using. Sent by return mail by addressing with stamp, naming this paper, Dr. J. C. STONE, 32 North Fifth Street, Philadelphia, Pa.—*Adv.*

Rational Pastimes.

TORONTO HARE AND HOUNDS.—The first run of the season on Saturday week was a grand success, and augurs well for the future of this young club. Twenty-three members met at the time appointed, and threw off on the hill just north of the Davenport road. After an exciting run of about six miles the hares were overtaken within a short distance of home by Messrs. Hare, (H. F. C.) and Palmer. The country generally was good going, though several stiff ploughs tried the endurance of the men, but ultimately all got in safely. Messrs. V. Sankey and C. Shaw were the hares.

COLLEGE ATHLETICS.—The tenth field meeting of the Columbia College Athletic Association, in conjunction with the Princeton Athletic Association, was held on the grounds of the New York Athletic Club, at Mott Haven, on Saturday last. The referee was James O'Neil; judges, Jasper T. Gooding, Professor J. H. Van Amringe; time-keepers, John Wood, C. H. Pierce; starter, John Whipple. Prizes of gold medals. The following is a summary of the various events:

1. One mile walk. 1, Charles Eldridge; 2, G. Francis, Columbia. Time, 7m. 28⅘s.

2. Running high jump. J. W. Prior, Columbia; H. Bogert, Columbia. Three trials each; 1ft. Distance, 5ft. 5in.

3. Half-mile run. 1, R. R. Colgate, Columbia; 2, G. W. Hammond, Columbia. Time, 2m. 5s.

4. Pole vaulting. 1, F. D. Weeks, Columbia; 2, H. Bogert, Columbia. Distance, 8ft. 5in.

5. Hundred yards dash. 1, William Waller, Columbia. Time, 11⅘s.

6. Throwing the hammer. 1, G. Farmly, Columbia; 2, Charles S. Boyd, Columbia. Distance, 70 ft.

7. Dash 440 yards. 1, G. W. Hammond, Columbia; 2, R. R. Colgate, Columbia. Time, 54m. 4⅖s.

8. Dash 220 yards. 1, W. W. Waller, Columbia; 2, W. R. Stewart, Columbia. Time, 25s.

9. Two-mile walk—walk over. Charles Eldridge, Columbia. Time, 19m. 39s.

10. Running broad jump. 1, A. Hunt, Princeton; 2, H. Bogert, Columbia. Five trials. Distance, 18 ft.

11. Hurdle race. Distance, 120 yards; 10 hurdles, 3 feet 6 inches high, 10 yards apart. 1, J. W. Pryor, Columbia, 2, A. W. De Forest, Columbia. Time, 20⅘s.

12. One mile race. 1, W. J. G. Barnes, Columbia; 2, W. H. Pharaer, Princeton. Time, 5m. 21s.

13. Strangers' race, half-mile run, eleven starters. 1, E. Merritt; 2, W. J. Duffy; 3, C. Vangeri; C. S. Davidson, W. H. Griffin, A. Vanderpoel, J. A. Nood, W. Roland, C. Fabrego, E. Lithiner, C. Gounard. Time, 2m. 11⅘s.

The medley race—hopping, jumping, running and hurdles, entire circuit of 330 yards—was won by A. W. De Forest over two other contestants.

CLASS 18.—FOX HOUNDS IN COUPLES (Dogs or Bitches).

561 G. A. Edmunds, HUNTER & JUDY, H. bl. and yel., 2 yrs., 6 mos.
562. Drake & Anderson (S. E. C.), N. J., GRAFT & ANNIE, G. 4 yrs.
563. Drake & Anderson (S.E.C.), N. J., HUNKEY and JULE, bl. and tan.
564. Drake & Anderson (S. E. C.), N. J., LOU and NED, bl. and tan.
565. A. F. Godefroy, N.Y., DRUM & LEAD, bl. tan, gr. & wh. 13 mos.
566. A. F. Godefroy, N. Y. JACK & DRIVE, wh. tan and blk. 8 yrs.
567. Dr. H. Gardner, N.Y., NELLIE and KATE, N. bl. and w. 3 yrs.; fl. bl. and tan, 3 yrs.

CLASS 19.—HARRIERS IN COUPLES (Dogs or Bitches).

568. W. Ahrens, Md., BELL & ROSE, bl. wh. and tan, 3 yrs. 5 mos.

CLASS 20.—BEAGLES (Dog or Bitch).

569. D. G. Hartt, Suffolk Co., N. Y. TOPSEY, bl. and tan, 2 yrs.
570. D. G. Hartt, Suffolk Co., N. Y., DINAH, bl. and tan, 1½ yrs.
571. J. E. Diehl, N. J., CENTENNIAL LUCY, fawn, tan and w. 5 yrs.
572. J. E. Diehl, N. J., NEW JERSEY FLY, fawn, tan and wh. 2 years.
573. Jesse Sherwood, Edina, Mo., LEE, bl., wh. and tan, 1 year.
574. Jesse Sherwood, Edina, Mo., LILLY, bl., wh. and tan, 1 year.

CLASS 21.—DACHSHUNDS (Dog or Bitch).

575. T. B. Allen, 883½ Pine St., N. Y., JEFF, w. and tan, 19 months.
576. T. B. Allen, 883½ Pine St., N. Y., SPOT, wh. and tan, 19 months.
577. J. M. Powell, Philadelphia, DUKE, fallow red, 20 months.
578. Frances Lesler, Box 1095, N. Y., BISMARCK, fallow red, 2 years.
579. Frances Lesler, Box 1095, N. Y., NELLIE, fallow red, 2½ years.
580. S. L. Parsons, Box 1118, N. Y., FRAU, bl. and tan, 3 years.
581. A. F. Godefroy, N. Y., SUSEY and 1 pup, bl. and tan, 3 years.
582. A. E. Godefroy, N. Y., DRUM, bl. and tan, 1 year and 11 months.
583. Fritz Gubner, L. J., MISS EM, bl. and tan, 3½ years.
584. St. A. Douglass Gubner, L. I., FRAULEIN WALDINA bl. tan, 16 m.
585. Dr. L. H. Twaddell, WALDEMANN, brilliant bl. and tan 3 yrs.
586. do. MEIN GRETCHEN, brill't bl. & tan 1 yr. & 3 m.
587. do. UNSER FRITZ, fallow red, 1 year and 3 mos.
588. do. SCHNAPPS, fallow fawn, 1 year and 3 mos.
589. do. ZACKERLE, chestnut and tan, 3 years.
590. do. FRAULEIN II., bl. and tan, 1 y. and 3 m.

CLASS 22.—FOX TERRIERS (Dog or Bitch).

591. C. Walton, N. Y., TRICKSEY, wh. and tan spot, 2 yrs. and 3 mos.
592. F. Carlisle, Newark, N. J., MAC 4th, bl. tan and wh., 6 yrs.
593. Dr. H. Gardner, N. Y., MINNIE, wh. br. ear and eye, 2 yrs.
594. J. H. Gossler, Pearl st., N. Y., NETTLE, wh., 3 yrs.
595. J. T. Soutter, N. Y., BISMARCK, wh., bl. star markings, 8 yrs.
596. J. T. Soutter, N. Y., DINAH, wh., bl. star markings, 6 years.
597. A. Belmont, Jr., N. Y., NELLIE, wh. and tan, 2 yrs. & 6 mos.
598. R. Tynan, N. Y., NELLIE, wh. with brindle ears, 1 yr. & 8 mos.
599. Mr. Darling, Fifth Avenue Hotel, DON, white, 2 yrs.
600. W. B. Kendall, N. Y., GRIP, white, 1 yr.
601. C. W. Griswold, N. Y., RASP, white, 3 yrs.
602. C. W. Griswold, N. Y., FLORA, white, 3 yrs.
603. J. M. FISKE, N. Y., RASP II., white, 2 yrs.

CLASS 23.—TERRIERS—Puppies (under 12 months).

604. R. Hoe, N. Y., PRINCE, wh. and br. spots, 7 mos.
605. J. H. Elliot, FEEFEE, wh., bl. tan and wh. spot on rump, 11 mos
606. H. Oderick, N. Y., TIPS, wh., black and tan, 6 mos.
607. S. Starling, 152 W. 18th st., FUSSY, wh. and black spots, 8 mos.
608. A. Belmont, Jr., N. Y., ROSE, fawn and black muzzle, 8 months.
609. C. W. Griswold, N. Y., TRIM, white, 9 months; PEARL, white, 9 months; NIPPER, white, 9 weeks; ROSE, white, 9 weeks; JUNO, white, 9 weeks; CORD, white, 9 weeks.
615. G. de Landre Macdona, England, TIM, wh. and spot, 9 mos.

CLASS 23.—GREYHOUNDS—(Dogs or Bitches).

616. A. Albright, Newark, N. J., CHARLIE, mouse color, over 2 yrs.
617. J. Robinson, Brooklyn, HUDIBRAS, red or fawn, 3 yrs. 2 mos.
618. R. R. Colgate, 264 Fifth Avenue, ——, brindle color, 2½ yrs.
619. P. J. Kelly, Brooklyn, SPIC NG, light brown, 3 years.
620. P. J. Kelley, Brooklyn, JENNY, bl., 2 years.
621. W. O. Gulliver, N. Y., GLADSTONE, fawn, 2 years.
622. J. H. Roberts, Phila., GUY, bl. and wh., 3 years.
623. J. H. Roberts, Phila., FLEET, dark blue, 1 year and 4 months.
624. Mrs. N. J. Leonard, N. Y., NELLIE, fawn, 4 years and 7 months.
625. Julius W. Porter, FRENCH, fawn, 1 year and 10 months; JULY, fawn, 1 year and 10 months.
627. Dr. Wilson, N. Y., FAWN, fawn, 6 years.
628. A. Van Vechten, Jr., Albany, N. Y., MOUSE, mouse color, 4 years.
629. W. B. Wetmore, N. Y., HASTY, blue, 4 years and 7 months;
VEXER yellow, 4 years and 7 months.
631. J. B. Miller, Newburgh; N. Y., MAX, fawn, 2 years.
632. Geo. Raper, England, ALBERT VICTOR, 2 years and 1 month.
633. H. G. Foster, England, ARROWLYTE, white and brindle, 2 years.

CLASS 24.—STAGHOUNDS (Dogs or Bitches).

634. Miss E. T. Pratt, Albany, N. Y., SIR WALTER, brindle, 2 years.
635. D. G. Hartt, Northport, N. Y., CLIO, bl. and wh., 2 years.
636. D. G. Hartt, Northport, N. Y., NED, bl. and wh., 6 years.
637. D. G. Hartt, Northport, N. Y., CHASE, bl. and wh., 6 years.
638. J. B. Miller, Newburgh, N. Y., STANLEY, bl. and tan, 7 years.
639. J. B. Miller, Newburgh, N. Y., MADGIE, bl. and tan, 6 years.

CLASS 25.—DEERHOUNDS (Dogs or Bitches).

640. Oakleigh Thorne, Dutchess Co., N. Y., MUGGINS, ash, 2 years.
641. J. Jordan, New York, BADGER, brindle, 2½ years.
642. Miss E. T. Pratt, Albany, N. Y., SIR WALTER, brindle, 2½ yrs.
643. H. Mead, Golden's Bridge, BALDER, yellow fawn, 1½ years.
645. W. J. Gulliver, New York, SANCHO, fawn, 3 years.
646. Robt. Tallant, Cambridge, Mass., CUSTER, fawn, 16 months.
646. Paul Dana, New York, BRAN, (formerly Young Scram) blue, 5 yrs.
647. T. Medley, 130 Piccadilly, London, Eng., OSCAR, brindle, 3 years; bred by her Majesty, the Queen of England, from the late Prince Consort's famous breed. £10,000.
648. T. Medley, 130 Piccadilly, London, Eng., DAGMAR, brindle, 3 years; bred by her Majesty as above.

The following awards have been made up to the time of our going to press:

Class 3.—Champion Gordon Setter Dogs.—1. Rupert, black and tan, 4 years, by Stokes' Shot, out of Rhona, the property of Jesse Sherwood Edina, Mo.; 2. Shot, black and tan, 6 years, A. F. Copeland, Boston. Very highly commended: Kent, by Kerr's Grouse out of Boydin's Hope, Worcester, Mass.

Class 3.—Champion Gordon Setter Bitches.—1. Norah, black and tan, 7½ years, by Pearce's champion Kent, out of champion Duchess; A. F. Copeland, Boston. Norah was without competitors, Lou being not for competition, and Di being absent.

Class 4.—Champion Pointer Dogs.—1. Snapshot, lemon and white, born September 17, 1869, by Whitehouse's Rap, out of Price's Judy, the property of R. G. Lloyd Price, Rivolia, Balas, North Wales.

Class 4.—Champion Pointer Bitches.—1. Bell, white and liver, 6 years, the property of the Columbus (Ohio) Kennel Club.

Class 9.—Native or Imported Gordon Setter Dogs.—1. Sancho, black, white, and tan, 5 years, by Leavitt's Brush out of Gibbons' Moll, II. Z. Leavitt, New York City; 2. Robin, black and tan, 2 years and 5 months by Royal, out of Rackett, A. Belmont, Jr. Very highly commended: Dinks, black and tan, 3 years, by Duke of Gordon, out of Kate, H. N. Munn, No. 37 Park Row. Highly commended: Spiero, black, white, and tan, whelped October 2, 1875, by Dr. Spier's Dick, out of his Daisy, E. S. Sanford, Jr.; and Scot, black and tan, 3 years, by Duke of Gordon, out of Kate, also commended; Judi did not show. This class was pronounced a splendid one, every dog in it was commended. Mr. Belmont protested against giving the first prize to Sancho on the alleged ground that he is not a Gordon setter.

Class 9.—Native and Imported Gordon Setter Bitches.—1. Belle, black and tan, 2½ years, by Wakefield's Jack, out of Williamson's bitch, G. S. Long Island. No. 2. Bess, black and tan, 2 years and 7 months, by Shot, out of Mab, James R. Tilley, Locust Valley, Long Island. Very highly commended: Border Lily, black and tan, 2 years, by Duke, out of Flirt, Fisher & Bickerton. Highly commended: Nell, black and tan, 3 years, by Tom, out of Bessie, W. J. Farrar, Toledo, Ohio.

Class 9.—Native or Imported Gordon Setter Dog Puppies, under 12 months.—1. Rex, black and tan, 7 months, by Monarch, out of champion Lou, M. Grinnel, New York City. Very highly commended: Romeo, black and tan, 10 months, by Gypsum, out of Daisy, Dr. S. F. Spier. Highly commended: Leo, same color, age, and pedigree, and same owner, and Sam, black and tan, 8 months, by Ponto, out of Witch, O'Brien Brothers, Yonkers, N. Y.

Class 9.—Native or Imported Gordon Setter Bitch Puppies, under 12 months.—1. Rose, black and tan, 9 months and 29 days, by Munn's imported Duke of Gordon, out of Dream, N. B. Martin, Orange, N. J. Very highly commended: Bess, black and tan, whelped May 15, 1876, by Jack, out of Flora, James L. Marvin, Newark, N. J. Highly commended: Black Bess, black and tan, 3½ months, by Walker's Dash, out of Bennett's Mab, J. W. Walker, Albany, N. Y.

Class 9.—Native Black and Tan, or Black, White, and Tan Setter Dogs.—1. Trump, black and tan, 1 year and 6 months, by Dash, out of Pryor's Belle, G. C. Colburn, New York. 2. Duke, black and tan, 2 years, by Dash, out of Mullins' Belle, same owner. Very highly commended: Sunny, black and tan, 10 months and 8 days, by White's Dan, out of Bess; Dan, by Colburn's Dash, out of Weddell's Fanny, R. C. Cornell. This was pronounced a grand class.

Class 9a.—Native Black and Tan, or Black, White, and Tan Setter Bitches.—1. Belle, black and tan, by Rodman's Dash, out of Pentz's Nellie, G. W. Hasstead, Newburgh, Dr. Spier's Fan was absent, and Mr. Granger's Beauty was protested against, on account of having been imported and wrongly entered.

Class 10.—Pointer Dogs over 50 Pounds.—1. Till, lemon and white, 2 years, by Tiny II., out of May, 4th, G. Strong, New York. 2. Dad, orange and white, 2½ years, E. H. Lathrop, Springfield, Mass. Very highly commended: Dan, liver and white, 1 year and 9 months, Nelson Cornell, West Meriden, Conn. Highly commended: Sport, liver and white, whelped July 3, 1875, by Dash, out of Nellie, R. A. Soule, Springfield, Mass., and Spot, lemon and white, 6 years, by Trump, out of Flora II., E. Leavitt, Jr., New York.

Class 10.—Chesapeake Bay Dogs.—1. Trip, C. H. Tighman, Easton, Md. 2d, Pride of the Chesapeake, E. H. Gillman, Detroit, Mich.

Class 14.—Irish Water Spaniels.—1. Mac., T. Finn, Bridgeport, Conn. 2. Dash, C. Dubois, Wagstaff, Babylon, Long Island. Highly commended: Sport, W. A. Coster, Flatbush, Long Island.

Class 15.—Retrieving Spaniels other Than Pure Irish.—1. Judy, T. Finn, Bridgeport, Conn. 2. Jute, John Thomas. Very highly commended: Scamp, R. S. Latrope, Baltimore.

Class 16.—Cocker Spaniels.—1. Witch, F. H. Hoe, Tarrytown, N. Y. 2. Countess, Raymond & Creed, Jamaica, Long Island. Very highly commended: Topsey, Drake & Anderson, Newton, N. J. Highly commended: Flirt, C. Allen, Worcester, Mass. Commended: Adelina Patti, E. H. Gillman, Detroit, Mich.

Class 17.—Field Spaniels of Any Other Breed.—1. Nod, G. H. Andrews, Brook-Haven, Long Island. 2. Fide, H. Blossom. Very highly commended: Floe, Jonathan Thorne, Jr. Highly commended: Shot, G. H.

Class 18.—Foxhounds in Couples.—1. Hunter and Judy, G. A. Edmund, North Brookfield, Mass. 2. Hunkey and Jule, Drake & Anderson, Newton, N. J. Highly commended: Drum and Lead, A. E. Godefroy, Neversink Lodge Kennels, New York.

Class 11.—Harriers in Couples.—Bell and Rose, W. Ahrens, Baltimore. There was only one entry.

Class 20.—Beagles.—1. New Jersey Fly, J. E. Diehl, Beverly, N. J. 2. Lilly, Jessie Sherwood, Edina, Mo. Very highly commended: Lee, same owner, and Dinah, D. G. Hartt, Northport, N. Y. Highly commended: Topsey, same owner.

Class 21.—Dachshunds.—The animals in this class were so nearly equal that the judges decided to divide up the money between three sets. The awards were: 1. pied, Spot, T. B. Allen; 2. pied, Jeff, same owner; 3. fallow red, Funk, Frances Lesler, New York; 4. fallow red, Nellie, same owner; 1. black and tan, Frau, S. L. Parsons, New York; 2. black and tan, Miss Em., Fritz Gubner, New-Utrecht, Long Island. Commended: Duke, J. M. Powell, Philadelphia. Benjamin and Fraulein Waldina were absent, and Dr. Twaddell's string did not compete, he being judge.

Class 22.—Fox Terriers.—1. Tricksey, C. Walton, No. 40 East Thirty-second street. 2. Don, Mr. Darling, Fifth Avenue Hotel. Very highly commended: Mac Fourth, F. Carlile, Newark. Highly commended: Flora, C. W. Griswold, Fifth Avenue Hotel.

Class 23.—Fox Terrier Puppies.—1. Tim, G. de Landre Macdons, England. 2. Tips, H. Oderfelder, No. 107 Front street. Very highly commended: Fussy, R. Starling, No. 152 West Eighteenth street. Highly commended: Nipper, Rose, Juno, and Cord, all belonging to C. W. Griswold, Fifth Avenue Hotel.

Class 23.—Greyhounds.—1. Hudibras, J. Robinson, Brooklyn; 2, Nellie, Mrs. A. Leonard, No. 58 W. Thirty-third street. Very highly commended: Fleet, J. H. Roberts, Philadelphia, and Judy, Julius W. Porter, No. 58 West West Thirty-third street. Highly commended: Max, J. B. Miller, Newburgh, N. Y. Commended: Guy, same owner; Monse, A. Van Vechten, Jr., Albany, and Vexer, W. B. Wetmore, No. 15 Waverly place; Abram Spring, Jennie, and Mr. Colgate's brindle.

Class 24.—Staghounds.—1. Stanley, J. B. Miller, Newburgh, N. Y. 2. Madgie, same owner; both formerly belonged to Gen. Custer.

Class 25.—Deerhounds.—1. Bran, Paul Dana, No. 6 West Eighteenth street; 2. Oscar T. Medley, No. 130 Picadilly, London, England. Very highly commended: Dagmar, same owner. Highly commended: Muggins, Oakleigh Thorne, Millbrook, N. Y.

DITTMAR POWDER.—Please direct all letters for the above powder to Neponset, Mass., and the orders will be promptly filled.

CARL DITTMAR.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

W. E. W., Philadelphia.—Letter received, and correction will be made in the Kennel Register.

E. T. C., Boston, Mass.—We learn that Adirondack boats are built in Boston by Frederick D. Graves, whom address at 374 Washington street, care of Bradford & Anthony.

JACOB.—Who would I have to address at Seaman's Pond, L. I., in order to obtain information concerning the trout fishing there?—Ans. Edward H. Seaman, Ridgewood P. O.

G. W. R., Elmira.—What would a six months' old setter pup cost delivered in Elmira? I should want good stock. I prefer the Irish setter? —Ans. From $25 to $50, according to the strain.

J. S. B., Albany, N. Y.—Please give me the scientific name of what is called West of the Rocky Mountains the "Sage Hen?" Where can I find it described and illustrated?—Ans. *Centrocercus urophasianus.* See Dr. Elliott Coues's "Birds of the Northwest."

C. D. B., Ithuca, N. Y.—Is the issue of a cross breed between a full blood black Gordon setter dog and a full blood spaniel of any account as a hunter, the sire being an imported dog?—Ans. We should not consider a dog so bred of any value.

PHILA.—Please inform me, through your paper, if you have a good book on the Dismal Swamp in Virginia, and what is the price of it?—Ans. Don't know of any such book. FOREST AND STREAM, Jan. 13, 1876, contains a long and full description of it.

CONSTANT READER, Covington, Ky.—Can you inform me where I can obtain the following thoroughbred pups—bull-dog, bull-terrier, mastiff, sheep dog?—Ans. You will find most of the breeds mentioned advertised for sale in our columns.

W. A. B., Montpelior.—1st. Are there any weekly or monthly publications in New York devoted to chess? and if so, where published and subscription price? 2d. What is the usual weight of cocker spaniels? —Ans. 1st. None at present in existence. 2d. About 35 pounds.

INQUIRER, London, Eng.—Have you any idea what birds are meant in "A Day of Sport in Texas," published in FOREST AND STREAM, February 8th, 1877, under the name of "Wet-Weather Birds?"—Ans. Not the slightest. We have to apologise for having overlooked this note for so long a time.

J. L. R., Cincinnati.—I have a skye terrier bitch, about ten years old, that is troubled with an ugly cough morning and night. She does not throw anything up, and keeps fat and eats well.—Ans. Considering the age of your bitch, it is doubtful if she can be cured. We should recommend for her a teaspoonful of cod liver oil morning and evening.

J. A. B., Atlantic City.—Please notice in your column of correspondence when the New York Dog Show takes place. Also, I have a setter dog that has had distemper, but has got over it and has gone blind. Is there any chance of his being restored to sight?—Ans. Bench Show occurs 8th, 9th and 10th of May. There is no possible chance for your dog.

G. A., Indianola, Texas.—Please advise me in your paper as to the best metal shell to get for use in an out-of-the-way place like this, where such things are not comeatable at all times; and as to how to get them?—Ans. Geo. E. Hart & Co., Newark, and the Union Metallic Cartridge Company, Bridgeport, Conn., make the metal shells you need Should suppose you could get them of Jos. Labadie, Galveston.

P. H. B., Middletown, Conn.—Will you please inform me the price and where I can obtain a book that will post me on fishing, and giving the different baits to be used?—Ans. Hallock's forthcoming work on the Game and Fish of North America will give you full information. To be published June 1st. Price, $3.

B. B., New York.—1st. When and what kind of fishing can be had at the Little Hell Gate and Westchester Creek? 2d. What is the best kind of bait to use?—Ans. Striped bass in spring and fall; weakfish from June to October. Use shedder crabs, clams, or sand worms for bait. Shrimp are also good for weakfish. The best localities can be ascertained from Mr. Jerolamon, foot of Eighty-fourth street, East River.

H. W. R., Paducah, Ky.—1st. Will flashing powder before shooting in choke-bores prevent loading? 2d. Coat Dittman powder per pound? 3d. Best and surest method of making choke-bores shoot open for snap and thicket shooting? 4th. Probable cost of a first-class 6¾ pound English muzzle-loading, 30-inch barrel gun?—Ans. 1st. Yes, it has been found to be very effective. 2d. $1 per can. 3d. By increasing charge of powder. 4th. Probably $150.

J. H. T., Philadelphia.—1st. I see a work and atlas of the New Jersey coast is being prepared. What will it cost? 2d. What firms make a business of manufacturing powder flasks in this country?—Ans. 1st. The cost will be duly advertised when the work is completed. 2d. The use of shells has so superceded the old powder flask that but few are now manufactured, and we know of no firm in this country who make a specialty of it.

J. B. P., Mount Holly, N. J.—1st. Will you please inform me where I can obtain a young cocker spaniel well broke, and at what price? 2d. How much would it cost to have a double-barreled shot gun turned into a breech-loader?—Ans. 1st. Mr. P. McKoon, Franklin, Delaware County, N. Y., has cockers for sale, but we do not know whether he has broken dogs. 2d. It depends entirely upon the quality of the gun, probably not less than $40.

F. R. G., Noroton, Ct.—1st. Do you consider decarbonized barrels safe, and could they be choke-bored? 2d. What should I put on bird skins before mounting? 3d. Are there any 20-bore guns made in America? 4th. Is Orange ducking powder as strong as Orange Lightning?—Ans. 1st. They are safe with a reasonable charge. They can be choke-bored. 2d. Arsenical soap. 3d. They could be made to order. 4th. It is quicker, and in equal measure probably stronger.

E. B. G., Elmira.—1st. Where can I procure the game laws of this State? 2d. Will you reprint the receipt for cleaning brass shells? 3d. Can you suggest any way in which I can trap a purple finch (*Carpodacus purpureus*)?—Ans. 1st. It would be useless to get the old laws now, as the new law will pass the Legislature shortly. The contest will be printed in this paper. 2d. Drop them into vinegar. 3d. We can only suggest the old trap cage with which boys catch yellow-birds, or bird lime placed on twigs where they are in the habit of congregating.

S., Philadelphia.—1st. Would a setter slut eleven months old be too old to spay? and if not, who in Philadelphia would do it? 2d. Are the Morford strain of setters of any particular color? I know of one that is black and white that is called a Morford setter. Do you suppose she is? 3d. Do you know of any responsible person in Philadelphia who takes hunting dogs to board? if so, what are his terms?—Ans. 1st. We think she would be too old. 2d. The Morford setters are orange and white, with black eyes and nose. The one you allude to may have been bred from some of his old stock, but not from the strain with which his name is identified. 3d. We do not.

C. B., Philadelphia.—I have a setter dog two and a half years old, his eyes are very red, and sometimes there is a slight running from them. At times he has great trouble with his stools, having to strain himself very much, as if he were trying to pass something and could not, and then there will be a slight evacuation, sometimes very hard and dry, and at others quite the reverse, and mixed with blood. Ans. You must correct the state of your dog's bowels by a change of diet, giving him boiled vegetables, such as carrots and cabbage, with musk of corn or oatmeal. He must have also abundant exercise and access to grass. The system once regulated, probably his eyes will get well.

J. B. D. C., Corpus Christi, Texas.—We catch here in our bay in shoal water a species of trout while fishing for red fish. The custom is to let the bait (crab) lie on the bottom. Is there not a better way of catching these bay trout—say with rod, etc., or with a different bait?—Ans. The fish you refer to is the *Cynoiion regalis*, known as the spotted salt water trout, spotted silver sides and grey trout. It is a species of weakfish, so-called at the north, and when handled with rod and reel affords most excellent sport. Use cut mullet for bait, and fish with a fine line and a float. Or you can take it with a trolling spoon drawn behind a moving boat on 100 feet of line. This fish also takes the artificial fly.

C. C. C.—Where is the best place for blackfish around New York? Is not the Cribs—an island near the lower quarantine—a good place? Which bait is best, small crabs, or shrimp? How large do blackfish run? How should a minnow be placed on a hook to keep it alive? What bait is best for catfish? What is the proper charge for a 6-pound, 14-gauge gun?—Ans. Wherever there are reefs, or rocks, and sunken wrecks you will find blackfish. For bait, use crabs, fiddler-crabs, or clams. Blackfish grow to twelve pounds in weight. Catfish will bite anything. Pass the hook into the mouth and out at the side, or through the back near the shoulders. The places you mention are good fishing grounds. 2½ drachms powder, 1 ounce shot for your gun.

J. W. G., Middletown.—1st. Will an eight pound 12-gauge gun give as good penetration as a nine pound 10-gauge gun, using full capacity of charges for each gun, and No. 6 shot for each, or same sized shot for each gun, regardless of size? 2d. Does not a full choke in a gun wear away by constant use in a short time; for instance, the way Capt. Bogardus uses his? 3d. Would you advise a person going to get a gun for field use to get a 10 or 12-gauge, and with or without choke, or, as Nichols and Lefever advise in their catalogue, the right barrel a true cylinder, and left a choke?—Ans. 1st. Theoretically they should, but guns, particularly if cylinder bored, vary so much that it is impossible to say. 2d. No, not if the barrels are first-class. Capt. Bogardus has fired probably 20,000 charges from one set of barrels, and the pattern is as good as ever. 3d. It depends upon the kind of shooting. If there was to be much duck shooting we should advise a 10-gauge gun with one barrel full choked; if for general field use we should prefer a gun cylinder barrel, but bored to make a good pattern.

J. M. H., Lynn, Mass.—I have a dog, a cross between Newfoundland and St. Bernard, about fourteen months old, much troubled by an intolerable itching, particularly at the root of the tail, and extending to the tip. A patch of hair has fallen or been torn off, exposing a sore at the rump. His eyes (where the white should be) are at times fiery and red, and when he is close to one he emits a disagreeable odor.—Ans. Your dog has mange, and his system is generally out of order. Wash his tail, and in fact his whole body, well with carbolic soap; after drying well, rub into the parts affected an ointment composed of 4 ounces basilicon ointment, ½ ounce of flour of sulphur, and turpentine enough to mix, repeating the dressing for several days. Give him a tablespoonful of Rochelle salts, and reduce his diet to as little meat as possible, giving farinaceous food instead. Keep him in a clean place, and change the straw frequently.

UNDOUNTEDLY one of the best and cheapest stocks of Carpetings, Oil-Cloths, Matting, etc., etc., to be found in the United States is that of Messrs. JOHN H. PRAY, SONS & CO., Washington Street, Boston. I. W. Adams is the sportsman of the firm, and will take special pains to please any of our friends calling upon him, or with any orders sent him. It is a good, reliable house.—*Adv.*

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company

—AT—

NO. 103 FULTON STREET, NEW YORK.

[POST OFFICE BOX 2832.]

Terms, Four Dollars a Year, Strictly in Advance

Twenty-five per cent. off for Clubs of Three or more

Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 50 cents per line.

*** Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, MAY 10, 1877.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen in sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

☞ Trade supplied by American News Company.

CHARLES HALLOCK, Editor.

T. C. BANKS, Business Manager. S. H. TURHILL, Western Manager.

NOTICE.

This paper is now issued from its office at 103 Fulton street, New York. We trust that our friends will overlook any apparent shortcomings, on account of the confusion attending removal to its new quarters

ENLARGEMENT PROMISED.—Our space is so much crowded this week that we cannot do justice to our readers and contributors. We shall enlarge to twenty-four pages next week, and subsequently to additional pages as occasion may require.

WE are pleased to see that Seydel & Co.'s Pocket or "Ashantee" hammocks, so highly spoken of in the columns of the British Army and Navy *Gazette*, are being introduced into this country by the agents, Messrs. McCoy & Co. We call the attention of our readers to their advertisement.

—The Missouri Legislature has passed a law by which all able-bodied male persons between twelve and sixty years of age are to be drafted for two days in each week during the spring months of the year to fight grasshoppers.

STATE RIGHTS IN OYSTER BEDS.—In the case of McCreay, vs. the State of Virginia (error to the Virginia Court of Appeals), the United States Supreme Court has decided as follows:

The State of Virginia can prohibit the citizens of other States from planting oysters in tide-water within her jurisdiction, while permitting her own people to do so. The ownership of the tide-waters and their beds is that of the people of the State in their united sovereignty, subject to the paramount right of navigation, the regulation of which, in respect to foreign and inter-State commerce, has been granted to the United States. There has, however, been no such grant of power over the fisheries. These remain under the exclusive control of the State, which has consequently the right in its discretion to appropriate its tide-waters and their beds to be used by its people as a common for taking and cultivating fish so far as it may be done without obstructing navigation. Such an appropriation is in effect nothing more than a regulation of the use of the people of their common property. This right of the people of the State comes not from their citizenship alone, but from their citizenship and property combined. It is, in fact, a property right, and not a mere privilege or immunity of citizenship.

THOUGHTS ON EDUCATION.—V.

IT is a mistake to suppose that playtime is lost time, or that the boy is necessarily a dunce who is quick at baseball, but knows not arithmetic. The child who can command a stretch of country over which to roam at will is in the best of all schools for one of tender years. No faculty is dulled, but every one strengthened. Who ever knew such a boy to forget how many eggs were in the nest he found in the hedgerow, or miss his way in returning to it? Who ever knew such a girl forget the bank where the daisies grow in loveliest profusion? Or who ever heard of either mistaking the cry of the whip-poor-will for the croak of the raven? We have no intention of suggesting pretty rural pictures for the sake of diversity. We ask questions, the answers to which involve very pertinent facts, and which enable us to bring forward the statement that, in the every-day lessons of out-door country life there is material enough for the cultivation of the memory and of the general intelligence. Every day and every hour are adding to a child's knowledge of natural history, while all the time it is brought into closest contact with agencies inexplicable in their operation, but of the purest kind. One can find children with a perfect fund of information as to the habits of animals and the nature of plants, which was entirely "picked up," as we say, and for not one iota of which are they indebted to "poring over miserable books." This, it may be said, is not history, geography, grammar or arithmetic; no, but it is the best possible foundation for such studies, as they are generally understood, and, in another and more correct sense, it includes most of them.

The fact is, and this is the point which we wish to reach, and upon which we would lay most stress, teaching in its present too prevalent method deals too much in abstractions. The result is that the memory alone is appealed to and real intelligence deadened. Take history as an example. Its facts are presented consecutively, that is to say, a certain President was elected in a certain year, served his time, and in course of time was gathered to his fathers; but events have no logical sequence. The mind of the youthful recipient of such information is immature, and cannot reason upon the facts presented to it, which are, however, impressed upon the tablets of memory until erased by time or displaced by something more attractive. Grammar furnishes another illustration. The art of reading, writing, and speaking a language correctly deals with rules and other matters far above a child's intelligent comprehension, and the acquisition of a knowledge of it resolves itself, therefore, into a mere exercise of memory. We have known a boy who was able to repeat the first three books of Euclid, and win a prize for his intimate acquaintance with them; but if the figure were presented upside down, the problem remained to him a problem still, and insoluble. His reasoning powers were never called into operation at all, and his unaided memory bore all the strain. The truths dealt with in all these branches are too abstract for the youthful intellect, stimulate it no doubt for a season, but having no permanent hold upon the intelligence, disappear in course of time, and in most cases long before the intellect has reached a sufficient maturity to enable it to reason upon and digest them.

The mind of youth must, therefore, be appealed to in some other way, and several expedients have been resorted to. Objects have been made use of instead of abstractions in imparting instruction, and, so far as we are aware, with the most beneficial results. The Kindergarten system has been adopted by many of the States, and is a vast improvement upon that which preceded it. In Canada object-teaching has been carried to a very high point of excellence. In natural history the lessons are drawn directly from nature instead of books and charts. An exhibit in the Ontario Education Department at the Centennial Exhibition revealed the present perfection of the system. Let us take botany first; cabinets were shown containing the raw and manufactured material, from which the child can be gradually brought to understand the nature and uses of the plant examined. Supposing the object to be wheat, specimens of the seed, bran, flour, biscuit, maccaroni, straw, straw plait, straw paper, etc., properly classified and shown, and are not only useful to teach young children the importance of common things, but impart a useful lesson in botany. These cabinets contain on the average 200 specimens, illustrative of the animal, vegetable and mineral kingdoms. The models for teaching physiology and anatomy are superb. More information can be gained of the true position and the formation of the organs of circulation and respiration, the necessity of cleanliness, the importance of attention to the teeth, etc., by studying these models for a few hours than can be obtained from books in years of close study. The system of teaching chemistry is equal to the others. The science is so simplified that little children can perform experiments. There is a laboratory for boys and girls, containing chemicals and apparatus to perform over 120 experiments in chemistry, manufactures, domestic economy, physiology, etc. Students' laboratories are supplied at $6 each, with a book to perform 200 experiments. The laboratories for teachers and Normal School students contain all the chemicals and apparatus to perform the ordinary experiments with the metalloids as found in elementary books on chemistry. We need hardly expatiate upon the evident superiority of this system over the old.

There are several side issues involved in this branch of our subject, such as a reformation in the order of studies, which we cannot even touch upon, and we will now state in the briefest possible terms our conclusions so far, that if it be preferable to put before a child something tangible in place of an abstraction, to educate him by showing him a thing instead of giving him a description of it, to appeal to his intellect through his senses instead of directly, then we must be right in claiming for the country the precedence among schools, and for nature that among teachers.

ON THE WAR PATH.

THE following extracts from a private letter, recently received by one of the editors of FOREST AND STREAM, will be interesting to such of our readers as are familiar with life on the plains and amid the mountains of the West. The writer is one of those true men with whose friendship we have been honored in our trans-Missouri wanderings, and by whose side we have hunted and been hunted, traveled, slept, and starved, over much of the territory between the Rocky Mountains and the Missouri River. Such men are not to be found every day, and one learns to know them thoroughly only when thrown in constant and close companionship with them in a country where a man's life depends on his coolness, his courage, and his skill with the rifle. Their numbers are yearly growing smaller, and we have had recently to mourn more than one cut off untimely. One of the bravest and best, a noble gentleman, though clad in the rough garb of a mountaineer, now sleeps in an uncared-for grave amid the yellow bluffs and desert solitudes of the Little Horn. Dear Charley, we "shall not look upon his like again."

The writer of the letter from which we make these excerpts has, with his brother, been throughout the winter in command of a large body of Indian scouts with Gen. Crook in the Powder River country. To many of our readers the modest story of brave deeds, toilsome marches, and dreadful suffering from cold will convey no particular idea of hardship, but the few who, like ourselves, have passed through a seasoning of a somewhat similar character, will appreciate and admire. The writer, under date of 14th February, says:

We left here on the 14th of October, and marched slowly north to the Running Water; got there on the 20th, and laid in camp until the evening of the 22d, when a courier brought us orders to move at once to Red Cloud Agency, twenty-five miles distant. We started at six o'clock in the evening and went to Red Cloud, and then F. and I took forty of our men and started for Red Cloud Village, which was forty miles distant. We overtook Gen. M., who had gone on ahead of us, and got to the village at daylight next morning. We captured the whole outfit and brought them up to the Agency, getting there before dark, having ridden one hundred and five miles in less than twenty-four hours, without having anything to eat and no sleep. That was pretty good, wasn't it?

Well, we went out on the expedition with Gen. Crook. We had one fight with the Cheyennes on the head of Powder River, and although we got their whole village and destroyed everything they had, we didn't get much the best of them in fighting. I tell you, they are the bravest people I ever saw. I don't think there were more than three hundred warriors in the village, and we had about one thousand men, and were fighting them all day, yet did not succeed in driving them more than half a mile from the village. We killed twenty-five, and lost six men killed and seventeen wounded. Dull Knife, the chief of the band, had three of his sons killed, and I have a small piece of scalp from the head of one of them. I wasn't more than a thousand miles from where he fell either, but I didn't take his scalp—had one of the boys do that part of it for me. I will send it to you if you want it.

I will tell you how it was: F. and I led the charge against the camp, and just at the edge of the village was a little clump of willows, which we had to pass. This Indian, Dull Knife's son, had run into the bushes, and as I was coming straight toward him he jumped out in front of me, about twenty steps away, and raised his gun (an old muzzle-loader). I dropped my reins and swung the "old long nine" around, and we both cut loose. He fell, and I passed on. Some time after F. and I happened around that way again, and I took a look at him. The shot had entered his right breast and come out under his left shoulder. Now, when I fired, he was in front, and a little to my right, so that I had to twist in the saddle somewhat to shoot. Of course everybody was shooting, and somebody else may have killed him, but I tried all the same. F. was out of luck this time, for I don't think he killed a single one during the fight, but for cool bravery he beats anything that you ever saw. Why, G——, at one time, we were under such hot fire that even our scouts wanted to run, and to tell you the truth, I felt sort o' that way myself; but F. just straightened himself up on the old black horse and said, very quietly: "The first one of my men that runs, I will kill." They didn't run.

This was the only fight we had. We had some terribly cold weather, mercury freezing, and so on. The hunting was very poor, and I only killed one antelope on the whole trip. Only saw two deer, and didn't get a shot at either. If you can arrange to come out next summer, try and fix it to go with us. We will have lots of fun, and I think lots of fighting, too. ***

[Ah! if we only could.—ED.]

SWISS VALLEY—The beautiful home of Mr. James Meyer, Jr., was the scene on Monday, May 7th, of a *fête champetre* given to his brother trout fishermen of the New York Sportsman's Association for the protection of Fish and Game, and his friends of the South Side Sportsman's Club of Long Island.

Swiss Valley is situated about midway between Pelham Manor and Pelhamville, in Westchester County. A coach conveyed the visitors from the railroad station, and the heartiest welcome awaited them at the home of the host. The New York *Times* says:

"The grounds were gay with handsome tents and variegated flags, while over the Swiss cottage of the host fluttered the ensign of his native Switzerland. The lake lay calm under the afternoon sun, only broken by the ripple made when the deftly cast fly of the angler touched its surface, or by the sudden dash of some luckless trout whose hunger or curiosity had overcome its discretion. A pretty brook feeds the lake, which, narrowing at the opposite extreme, passes under a rustic bridge and loses itself in a slender stream among the rocks. The grounds have evidently been laid out with care, and the view from the knoll above the lake is one of great beauty.

"After luncheon the late arrivals go down to the water-side, and, after a careful and conscientious examination of each fisherman's creel, chaff the unsuccessful men without mercy. In the meanwhile, as the sun goes down, the fish break oftener, and some of the anglers are doing fair work. Occasionally some lucky man lands two fish at a time and his success meets with great applause.

"'Catch all you can,' shouts Mr. Meyer from the knoll above the lake, where the marquee is pitched, 'we want 'em to fry, you know.'

"About 6 o'clock a general order is issued to cease fishing all along the line and to adjourn to refreshments. An examination of the catches of each gentleman reveals the fact that Mr. Wakeman Holberton, the artist, leads the list with 36; Mr. J. Reynauld comes next with 33, while Henry N.

Munn can lay claim to 25, and other gentlemen to a lesser catch.

"Around the lunch-table are soon gathered the anglers and the anglers' friends. Among those present were ex-Senator B. L. Inddington, Robert B. Roosevelt, Royal Phelps, Charles W. Hutchinson, ex-Mayor of Utica, N. Y.; Charles Hallock, editor FOREST AND STREAM; S. M. Saunders, Dr. Stephen A. Munn, H. N. Munn, D. H. Lawrence, Dr. Stephen A. Main, Dr. Doaran, John E. Develin, Charles E. Whitehead, H. C. Stephens, and C. J. Stephens. Toasts were drunk, speeches made, and the day's entertainment concluded with a rattling drive over the hills to the Pelhamville railway station."

Rifle.

CREEDMOOR.—The fine weather tempted a large number of marksmen to Creedmoor on Saturday last. The principal events were the match for the Sharp's gold prize of $250, and the eighth competition for the marksman's badge. The former is a long range match, 15 shots being fired at 800, 900, and 1,000 yards. The conditions require that the winner shall lead all competitors at each range, and as this rarely occurs it seems probable that the prize will remain unclaimed for some time. The following are the scores:

Name.	800 yds.	900 yds.	1,000 yds.	Total.
C. E. Blydenburg	68	70	62	200
H. S. Jewell	69	72	65	196
H. L. Allen	68	69	66	193
Homer Fisher	69	72	51	192
L. Weber	65	67	58	190
E. H. Madison	68	50	54	172
J. P. Waters	57	56	54	167
W. S. Elmanderfer	52	51	62	165
G. L. Morse	54	55	53	162
S. Frederick	54	51	48	153

In the marksman's badge there were eighty-nine entries. Of this number fifty-three made 25 points or more, and thus won the right to stand on this record as marksmen in the National Guard practices.

CONLIN'S GALLERY.—The amateur's competitions which will occur weekly at Conlin's Gallery were inaugurated at the old place. The second contest took place last Thursday evening, much to the satisfaction of many shootists, as was demonstrated by a large number of entries and the interest taken in the shooting throughout the match.

The badges are three in number, two of gold and one of silver, elegantly designed; they are to be won three times, not necessarily consecutively, before becoming the property of the winners. The conditions are:

Open to all comers, with the exception of those who have scored better than 46 out of a possible 50 at Wimbledon 200 yds. target reduced for 110 ft., and those who have won first prizes in any of the previous matches at Conlin's Galleries, 10 shots, rifle 22 cal., off hand at 200 yds. Creedmoor target reduced for the range, 100 ft. The rules of the N. R. A. to govern the match.

The shooting was very good; the following are the scores made above 42:

M. L. Riggs	46	D. L. Beckwith	44
B. Zettler	46	W. H. Smith	43
Leon Backer	44	W. Campbell	43
Fred Alder	44	M. B. Engel	43
L. C. Bruce	44	Thomas Wilden, M.D.	42
Thomas Fenton	44		

Mr. L. Riggs won the first badge (which had been won once before by L. C. Bruce), B. Zettler the second, and Leon Backer the third.

The competitions will take place every Thursday evening with the exception of the next one, which comes off Saturday, May 12th, on account of the match for the championship of gallery teams taking place this (Thursday) evening.

HELLWIG'S RIFLE GALLERY.—The Centennial Rifle Club held their second and third competitions for a gold badge, presented by A. G. Hellwig, on April 23d and 30th. The following scores out of a possible 100 points were made:

Name.	Total.	Name.	Total.
A. Oates	93	T. J. Jewesson	91
A. E. Long	86	A. Oates	91
J. Q. Adams	86	J. Q. Adams	86
J. L. La Forge	86	A. E. Long	85
J. Maguire	85	B. S. Brown	84
T. J. Jewesson	85	W. Marshall	84
W. R. Brown	83	J. Maguire	83
J. Marshall	82	E. Bryant	81
J. Reilly	77	F. Fitzgerald	76
W. R. Brown	93	J. Reilly	71
J. F. Murca	92		

FOURTH COMPETITION OF THE CENTENNIAL RIFLE CLUB.—This match took place at Hellwig's Gallery on May 7th. The following is the score:

Name.	Total.	Name.	Total.
J. F. Fitzgerald	77	J. Murch	91
W. Marshall	81	T. J. Jewesson	81
W. R. Brown	83	John Rielly	67
J. Q. Adams	79	A. E. Long	86
B. S. Brown	86	A. Oates	92
J. Maguire	88		

ZETTLER RIFLE CLUB, 207 Bowery, at their weekly practice gallery shoot, 100 ft. off hand, Creedmoor target reduced, possible 50:

M. B. Engel	49	J. Dutil	45
T. Kleisrath	49	C. Judson	45
G. Zettler	49	P. Fleming	44
L. Bode	48	D. L. Beck	44
D. Muller	46	Zimmerman	44
W. Klein	46	M. L. Riggs	43
B. Zettler	46	P. Ross	43

Mr. George L. Petrie, of the Zettler Club, left on the steamer Weser, of the Hamburg line, for a three months' visit to the Fatherland. Quite a number of riflemen from the Tritonen and Zettler Clubs saw him off. Captain Elerich made the parting address.

GLEN DRAKE.—The opening meeting this year of the American Rifle Association was held on Thursday last. Four matches were shot, all at 200 yards (any rifle), from the shoulder. The first match, for a valuable field glass, was won by D. F. Davids, on a score of 21 out of a possible 25 points; in the second, for a Holden rifle, John Boles won with a score of 19 out of a possible 25 points; the first subscription match was won by G. W. Davidson, by a score of 23 out of 25 points.

RIFLE SHOOTING AT JAMAICA, L. I.—The score of the second match for challenge badges on the range of the Jamaica Rod and Rifle Association is as follows: the contest is for two badges, the first for the highest score, the second for the best 38 or under. Geo. A. Reed won the first, and Theo. Rogers the second. This match takes place weekly:

Geo. A. Reed	43	Jno. M. Crane	37
L. B. Jaggar	42	Jno. Byder	37
Thos. Lloyd	41	Geo. A. Hicks	37
Geo. H. Creed	40	Gen. W. Damon	36
Wm. S. Elmendorf	39	Geo. B. Fleury	35
Wm. S. Cogswell	39	Wm. Durland, Jr.	28
Theo. Rogers	38		

SPRING SHOOTING FESTIVAL.—The Newark Shooting Society hold their opening prize-shoot at their Park, South Orange Avenue, Newark, N. J., Monday and Tuesday, May 14th and 15th inst. They offer $145 cash in 20 prizes on the ring target; $145 do. on the man target, and $100 do. on the bull's-eye target, as well as premiums. All riflemen interested in off-hand shooting are cordially invited.

NEW JERSEY.—The following are the scores made at the monthly meeting of the Hackensack Rifle Association on the 27th ult., in the contest for the Fream Badge, Mr. Van Strachitz winning for the second time:

Van Strachitz	41	J. Wood	35
A. Banta	41	Conklin	35
W. Hollerton	40	H. Banta	35
W. V. Clark	39	E. Ackerman	34
Van Valen	39	Bruns	33
B. S. Earle	36	Gilham	31

[This report would have been of some value if it had stated the distance and rifles used.—ED.]

LINCOLN'S GALLERY, BOSTON.—The match for the Smith & Wesson new model revolvers, held at this gallery on April 30, with 21 entries, distance 150 feet, each marksman being allowed eight shots, possible 40. The following is the record:

D. F. Small	37	J. H. L. Harris	35
W. Poland	37	W. B. Perkins	34
Geo. Fira	36	Wm. E. Guirries	34
A. W. Roberson	36	C. F. Peck	34
C. A. Parker	36	M. Hinckley	34
H. T. Rockwell	35	J. McGillseary	31
J. F. Fillmore	35	J. Ritchie, Jr.	31
E. B. Souther	35	Cpt. Nat Wales	32
Adam Dan	35	H. F. Harris	31
W. A. Twombly	35	J. J. Kinnhaw	30
J. W. Fuller	35		

R. I. AMATEUR RIFLE CLUB.—At the annual meeting of the R. I. Amateur Rifle Club, the following gentlemen were elected officers for the ensuing year: President, F. J. Rabbeth; Vice-President, J. H. Crowell; Treasurer, G. H. Clark; Secretary, John Howe. Range Committee, F. J. Rabbeth, Geo. W. Davison, and Chas. H. Perkins. Executive Committee, C. F. Pope, C. H. Guild, C. H. Perkins, G. W. Davison, and E. Thomas.

CONNECTICUT.—There will be a rifle match between teams from Harvard and Yale in June. Harvard challenges to shoot a match with team of six men, 200 yards, Creedmoor rules; and Yale, although her club has been but recently organized, and has but few members, has accepted the challenge. This will no doubt create a new interest in the college sports and rifle clubs, and rifle matches may become as popular as boating.

The Willow Brook Range was open on the 29th ult. for practice, which was indulged in by a goodly number of members; no official scores kept. Regular matches open to all members will be shot every second and fourth Saturday of each month through the season. The prospects now are of a large membership and an exciting season.

The premium of $5 offered for the best score made in off-hand shooting at the rifle range 32 Church Street, New Haven, last week, distance 100 feet, was won by E. A. Folsom, by a score of 97 out of a possible 100. The two dollar and a half gold piece, for best score with dead rest, was awarded to W. H. Layne, on a score of 49 out of a possible 50. Premiums of similar value are offered the ensuing week.

THE REMINGTON RIFLE.—We have been handed the following letter from the Rev. Geo. Guyer of Half Moon, Pa., dated April 22d:

E. REMINGTON & SONS:

The Remington combined rifle and shot gun, 23-inch, 10-gauge, 40 calibre, you sent me more than a year past, gives entire satisfaction. Last fall I shot two five-pronged bucks (very large deer) in succession; first one with ball, second with buckshot. The buckshot was fully 60 yards. I also shot with buckshot a very large doe. I could not be induced to handle any other form of gun for deer shooting.

Signed G. GUYER.

RECOIL.

NEWPORT, R. I., April 13, 1877.

EDITOR FOREST AND STREAM,

I cannot help trying to point out to "Onicko" a little discrepancy in his article on "The Causes of Recoil." He says: "The explosion of the powder, when driving the bullet out of the barrel communicates to the arm itself a motion which is not perceptible until the projectile has *left* the gun, etc." Again, "As the point of resistance (the shoulder) is beneath the line of recoil, the explosion has a tendency to throw the muzzle up and send the bullet high." Query: How can the explosion send the bullet high when the recoil is imperceptible until the bullet has *left* the rifle barrel? My opinion is, that the recoil begins with the starting of the bullet, and increases as its load is increased by the lifting the column of air and the friction in the rifle barrel. "SHOT."

TORONTO, April 27, 1877.

EDITOR FOREST AND STREAM,

In your issue of April 12th there is an article from "Onicko." With your kind indulgence, I will give you my definition. The recoil of a gun is caused and governed by the same law as the bursting of a steam boiler; the expansion takes place betwixt the breech and ball. The ball acts as a safety valve giving way to the breech. It is the sudden generation of a quantity of gas or elastic vapor, equal to one thousand (1,000) atmospheres, which is the cause of the recoil. If the ball was as heavy as the gun, no man could withstand the shock or recoil. Bursting anything with water is quite a different action. Water, being a non-elastic body, will burst any vessel that it is confined in without any shock whatever. You have only to apply a powerful force-pump, and man cannot make a vessel strong enough to resist the pressure.

There is no recoil that can take place with a gun until the ball leaves the muzzle. If it was not so, it would be impossible to shoot so well with a rifle. There is many a man who will take the head off a partridge nearly every shot, and if the recoil was to take place while the ball was passing through the barrel, it would be impossible to hold on so steadily to the mark. Suppose a steam boiler of the olden style, twenty feet long by twenty-two inch diameter; the common pressure exerted on such a boiler would be equal to five hundred and sixty-four (564) tons over the atmosphere; that boiler will lie perfectly still with that pressure, but suppose that one of the ends gives way, the recoil would immediately take place—the head would go one way, the boiler the other. The recoil of the twenty-foot boiler is so great that I have seen one go through both walls of a house and land in the middle of the street. It is exactly the same law that causes a gun to kick.

Your letter to C. M. Suthfe, M. D., is rather hard on Col. Dodge. The Colonel may be right about the trajectory, as the English Express Hunting Rifle will come up to two hundred (200) yards, with a very small deflection. The way that this is accomplished is by making a very light hollow ball filled up with a wooden plug, and from one hundred and twenty (120) to one hundred and thirty (130) grains Curtin and Harvey's strongest powder, which gives less recoil than a Creedmoor forty-four calibre rifle. This Express rifle will shoot off-hand very well up to three hundred (300) yards; beyond that range it looses power very quickly, and the path of the ball will describe a perfect parabola as to shooting with both eyes open. I don't think Col. Dodge can mean a rifle; a shot gun is quite a different thing. I have been trying to use both eyes with the rifle but I must confess I have got dead-beat and cannot do it.

TORONTO.

We shall feel obliged if Secretaries of Rifle Clubs in forwarding us reports of the matches shot on their various ranges will name the rifle used by each competitor. By observing this particular the interest of the report to the general reader is greatly enhanced.

NOTICE TO SPORTSMEN.—Having received so many communications asking us for information in regard to our six-section bamboo trout, black bass, grilse and salmon rods, we have prepared a circular on the subject, which we shall take pleasure in forwarding to any address. We keep on hand all grades, the prices of which range from $15 to $150. We put our stamp only on the best, in order to protect our customers and our reputation, for we are unwilling to sell a poor rod with a false enamel (made by burning and staining, to imitate the genuine article), without letting our customers know just what they are getting.

P. O. BOX, 1,294.—Adv. ABBEY & IMBRIE, 48 Maiden Lane.

Game Bag and Gun.

MAY IS A CLOSE MONTH FOR GAME.

SHOOTING MATCH AT FLUSHING.—On Saturday, May 5th, a pigeon match of an interesting character took place at the Hoffman House, Flushing, L. I., between Dr. B. Talbot of New York, and Mr. Charles Hance of Flushing. The match was for a cup given by Harry Hill of New York, to become the property of any one holding it for one year. It was first shot for at Flushing in April, 1876, when Dr. Talbot won it against thirteen competitors, and has since held it against all comers, winning also the present champion contest.

The conditions on Saturday were, each to shoot at 11 pigeons, from H. and T. traps, 21 yards rise, old Long Island rules. The result was that each killed all his birds. As there were no more pigeons on hand, the only way to decide the match was for each to shoot at 10 glass balls to be sprung from two of Capt. Bogardus' patent traps, under the former conditions. Of these Dr. Talbot hit 8, and his opponent 2, making the Doctor the victor.

MASSACHUSETTS.—*Plymouth County, May* 1.—Large numbers of geese have been shot this season on the North River, Marshfield; and on April 16th I saw at least one hundred flocks go over in one afternoon. Brant shooting has been almost a total failure, for in one week I only got three ducks; also have been wild and very scarce, and shelldrakes especially so. The great amount of rain has put an impassable barrier on snipes, and no one can get to the brooks for trout without getting wet.—We have had northeast storms and rain for a month. Yellowlegs are just coming along, and we hope for a shot or two during the week they remain with us. S. K., JR.

"BLUE GLASS" MATCH AT PROVIDENCE.—Another shooting match took place at the base-ball grounds at Providence, R. I., on May 3d, which was a success, perhaps owing to the fact that *blue glass* balls were employed. Three of the Bogardus traps with blue glass balls were used, and were placed ten yards apart, the shooter not knowing what one was to be sprung. The first match was for three prizes, $10, $6, $4, each participant to shoot at fifteen balls while they were in the air, and to stand eighteen yards from the trap when firing. There were twenty entries, and the shooting was exciting. Appended is the score:

Name.	Total.	Name.	Total.
E. Pratt	8	Jim Tinker	1
F. Burbank	9	Al. Tinker	3
G. Anthony	9	W. Tallman	9
W. Horton	13	H. G. Place	7
W. Herbert	10	W. Hendrick	4
H. B. Cook	10	Frank Carpenter	6
W. Smith	12	John Smith	9
E. W. Tinker	7	William Crandall	10
C. F. Babcock	9	George Crandall	11
E. W. Babcock	7	George Crandall, Jr.	0

W. Horton took the first prize, W. Smith the second, and George Crandall the third. A sweepstake match for five pairs of glass balls was next contested, and E. W. Tinker was awarded the $10. PHLOX.

WASHINGTON, D. C.—*May 5th.*—Glass-ball shooting has become a popular amusement here. We shoot from a trap (or series of traps) that throws the balls in five different directions; one to the right, one-half quartering to the right, one driver, one-half quartering to the left, and one to the left; the shooter not to know which trap is to be sprung. I give scores of those of our first matches:

1ST MATCH.

Conditions, 10 balls each, 18 yards rise.

McLeod	0	Derrick	8
Mills	7	Tappan	2
Jansen	6	Kenly	2

2ND MATCH.

Williams	7	Jansen	5
Mills	10	Derrick	7
Norhous	5	Wimsatt	5
Tappan	1		

3RD MATCH.

Breech-loading shot gun.

Mills	5	Jansen	3
Derrick	5	Alexander	3
Williams	4	Alexander	4
Ferguson	4		

Mr. Mills won the gun, making a clean score on the tie. Messrs. Williams, Derrick, Kenly, Ferguson and Mills are somewhat celebrated as pigeon shots, Mr. Kenley having divided the first prize with Tom South of Kentucky at the Centennial Tournament. I think these scores will be interesting by way of comparison between ball and pigeon shooting. SPORTSMAN.

—In a letter from J. C. Done of La Crosse, Wis., of the 25th ult., we find that the ducks have jumped that place in their northern flight, but pigeons have come in large numbers, notwithstanding a severe snow storm was raging.

The Kennel.

THE WEBSTER SETTERS.

So much interest has been manifested in everything connected with the brace of setters imported into this country by the great statesman, that the following letter, which has never before been made public, will be read with interest. It was addressed by Mr. George W. Blunt, Harbor Commissioner, to Dr. Fowler, of Orange, N. J., into whose possession we believe the Treuper dog passed, and who bred from him:

NEW YORK, April 10, 1874.

MY DEAR SIR:—Rake and Rachel were bought in England in October, 1839; they were bought by Daniel Webster, who obtained them through Sir Henry Halford, the King's physician. They arrived here in December, 1839, and were turned over to me, as Mr. W. got them by my request. Rachel was with pup and had thirteen pups. I distributed them among Mr. W.'s and my friends; the names I cannot remember. Treuper had one, M. C. Peterson one. Rake and Rachel were the genuine Duke of Gordon setters; the sire of them by different bitches was Regent, bought at Tattersall's by the Earl of Chesterfield for seventy-five guineas, to breed from. I had the pedigree, it was equal to any of the F. F. V.'s. I kept the pair until January, 1842. Mr. Webster then sent for Rachel, she belonging to him, Rake to me. A pair of handsomer, steadier, accurate-nosed dogs, superior to them, I never knew of. It was delightful to shoot over them. What became of Rachel I know not, as Mr. W. went off with Tyler and took Rachel. I stayed with my party. Rake died at Lake Mahopack in October, 1844, in my possession. The account of them in the sporting paper of March 26th is nearly right. Yours truly,

GEORGE W. BLUNT.

Of all dog laws yet invented, that of Hartford is the most stringent and at the same time the most absurd. By its provisions all Hartford dogs are required, from the 27th day of April until the 27th day of September, to be either confined on the premises of their owners, or else kept continually and securely muzzled. And any citizen has the privilege of killing any dog found at large without a muzzle. When will people learn to make a distinction between the curs of the gutter and the well bred dogs that are but little less valuable and no more liable to hydrophobia than horses. If anything would make a dog mad it would be keeping him chained for six months, or compelling him to wear a muzzle.

—Mr. KNOX writes us from Pittsburgh, Pa., that he has sold his imported Field Trial bitch Livy to Mr. F. B. Farnsworth of Paris, Ont. He also says that his brood bitch Bella, by Rob Roy out of Bess, has arrived. Bella's own sister was the dam of Young Sam, winner of puppy stakes, Shrewsbury, 1876. She came from the kennel of Lord Downe, England, in whelp to his Duke, and is expected to whelp in a few days. Bella is a thorough performer on all kinds of English game.

CONNECTICUT.—The Stamford Field Trial, which was to come off this fall, is postponed on account of the Game Club being unable to procure the necessary five quail to let go in this vicinity. Notwithstanding $5 per dozen was offered for them, they could not be got, North or South. A very handsome sum was subscribed for the purpose of procuring all the necessary birds, and had the Club succeeded in getting them, a Field Trial of no small nature would have taken place, as it was the intention of the Club to offer liberal and costly prizes for competition. 1878, it is hoped, will see one of the largest Field Trials ever held in New England. Where are the English snipe this spring? They gave us a wide berth, as only one, I believe, was killed in this vicinity. Notwithstanding, we have watched and waited for their appearance daily. A.

[We fancy the flight has dribbled by, as but few snipe have been killed in this vicinity.—ED.]

—The silver strain setter bitch Cora, belonging to Mr. R. H. Gillespie of Stamford, Connecticut, has whelped three dogs and three bitches, sired by Smith's Jeff. The silver strain setters are all white with black points, and are said to be excellent working stock.

—C. A. Mack's black setter bitch Juno whelped ten on the 21st ult. They are by the blue belton Frank, owned by Mr. Torpin of Philadelphia. The Detroit Kennel Club lost by death, on the 24th ult., their fox terrier bitch Tricksey, second.

KENNEL PRODUCE.—Sylvanus Sampson's imported Irish setter bitch Beauty, dropped an unusually large litter of 11 dogs, 3 bitches, April 27th by a noted Boston dog.

THE NEW YORK BENCH SHOW.

THE magnitude of this show makes demands upon our space with which it is difficult for us to comply. Gilmore's Garden is fairly alive with dogs, and a vast concourse of spectators fills the spacious promenades from morning until late in the evening. Up to the time of our going to press the list of awards has not been completed, but we give such as has been made public. All comments must, for obvious reasons, be deferred until our next issue. All prominent kennels in the country are represented. Mr. L. H. Smith, of Strathroy, Canada, is here with his field-tried dogs; Mr. Dilley of Lake City, Minn., has his pointers, and Mr. Sherwood, of Edina, Mo., has a miscellaneous collection comprising twenty-four sporting dogs. The St. Louis, Toledo, Cincinnati, Baltimore and other kennels are all present. On Sunday Mr. G. de Landre Macdona and son arrived in the steamer Nevada, of the Williams & Guion Line. He brings with him Magnet and Ranger II, a brace of beautiful setters, sorrel red Irish setters by Rover, a brace of magnificent St. Bernards, a fox-terrier and a most perfect specimen of the skye. The dogs exhibited in all classes are, as a rule, remarkably good, and considering the immense number, far beyond the average. The time allowed the managers for getting the Garden in order was far too short for an undertaking of such magnitude, and it is only to be wondered at that they were ready to receive so many dogs on the day previous to the opening of the show.

Catalogue of Sporting Dogs exhibited at the New York Bench Show of Dogs, held under the auspices of the Westminster Kennel Club, at Gilmore's Garden, New York, May 8th, 9th and 10th.

SPORTING DOGS.

CHAMPION CLASSES.

For either native or imported Dogs or Bitches that have won first prizes at any Bench Show in this country or abroad, the Centennial Bench Show at Philadelphia not included.

CLASS 1.—CHAMPION ENGLISH SETTER DOGS.
(For Previous Winners of a First Prize).

1. L. H. Smith, Strathroy, Ontario, Canada. LEICESTER, lemon and white, 5 years.
2. Charles H. Raymond, Morris Plains, N. J. PRIDE OF THE BORDER, liver and white, 8 years.
3. Arnold Burgess, Hillsdale, Mich. ROB ROY, black, white and tan, 6 years.
4. Miss M. D. Wagstaff, Babylon, L. I. DON, white and black, 4 yrs.
5. G. de Landre Macdona, F. R. G. S., Hilbre House, West Kirby, Cheshire, Eng. BLUE PRINCE II., blue belton and white, 2 years; RANGER II., white and lemon, 3 years.

CLASS 1.—CHAMPION ENGLISH SETTER BITCHES.

7. Thos. Morford, Newton, N. J. MAY, orange and white, 3 years.
8. L. H. Smith, Strathroy, Ontario, Canada. DART, blue belton, 5 yrs.
9. C. S. Westcott, 511 South 42d street, West Phila. MAGNET, black and white ticked, 2 years.

CLASS 2.—CHAMPION IRISH SETTER DOGS.

10. Campbell Stewart, 152 Fifth Ave., N. Y. DUKE, red, 4 years.
11. E. H. Pomeroy, 150 Broadway, N. Y. SOCKS, red and white, 4 yrs.
12. J. F. Rathyen, Box 110, Port Richmond, Staten Island. JACK (formerly known as JOE), red, 2½ years.
13. Dr. Wm. Jarvis, Claremont, N. H. ELCHO, red, born May, 1874.
14. Arnold Burges, Hillsdale, Mich. RUFUS, red, 5 years.
15. W. J. Farrar, Toledo, O. PLUNKET, red, 9 years.

CLASS 2.—CHAMPION IRISH SETTER BITCHES.

16. W. J. Farrar, Toledo, Ohio. CARRIE, red, 6 years.
17. Kenneth G. White, College Point, L. I. LADY, red, 7 y. and 1 mo.
18. Nicholas Saltus, Morristown, N. J. LILL III., dark red, 2 years.
19. St. Louis Kennel Club, St. Louis, Mo. LOO II., red.
20. Benjamin S. Nelson. MAGGIE, red, born July 1st, 1869.
21. Thomas Adcock. JUNO, red, 6 years 11 months.

CLASS 3.—CHAMPION GORDON SETTER DOGS.

22. Jerome Marble. GROUSE, black and tan, 4 years.
23. A. F. Copeland, Boston, Mass. SHOT, black and tan, 6 years.
24. George C. Colburn. DASH, black, white and tan, 7 years.
25. C. H. Bowker, Worcester, Mass. KENT.
26. Jesse Sherwood. RUPERT, black and tan 4 years.

CLASS 3.—CHAMPION GORDON SETTER BITCHES.

27. Westminster Kennel Club. LOU, and litter of 9 puppies, black and tan, 2½ years.
28. A. F. Copeland. NORAH, black and tan, 7½ years.
30. James H. Tilley. DI, black and tan, 5 years.

CLASS 4.—CHAMPION, POINTER DOGS (any weight).

31. Westminster Kennel Club. SENSATION, lemon and white, 3 yrs.
32. Frederick Schuchardt. TOM, black, 11 years.
33. Wm. Fred'k Steele. FLAKE, lem. and wh., 2 yrs. and 10 mos.
34. St. Louis Kennel Club. SLEAFORD.
35 Columbus, O., Kennel Club. SHOT, liv. and wh., 3 years.
36. Dr. E. Dyer. RAB, liver, 2½ years.
37. R. J. L. Price. SNAPSHOT, lem. and wh., born Sept. 17, 1869.

TO WHOM IT MAY CONCERN:

NEW YORK, May 6, 1877.

In regard to my patent rough glass balls, I understand that there are instances where they have been ordered and smooth balls sent in their place. All parties ordering will find none genuine unless they bear lettered on each ball the name of "Bogardus' glass ball, Patented April 10, 1877," and further, that George R. Hart & Co. of Newark, N. J., are the sole agents for the wholesale trade for the glass balls and traps. I also take orders wherever I shoot. I have shot two matches of 1,000 balls each, and in the first I had to shoot at 1,136 smooth balls to break 1,000, and at the second I used my patent rough balls, breaking 1,000 out of 1,028. I know, by experience, that the shot will glance off from the smooth balls, as I have hit them with three or four No. 8 shot without breaking them. Respectfully yours, A. H. BOGARDUS.—*Adv.*

Tiffany & Co., Silversmiths, Jewelers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their timing watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. Tiffany & Co., are also the agents in America for Messrs. Patek, Philippe & Co., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Bronzes and Artistic Pottery is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. Union Square, New York

Spratt's Patent

Meat Fibrine Dog Cakes

GENUINE

STAMPED

From the reputation these Meat Fibrine Cakes have now gained, they require scarcely any explanation to recommend them to the use of every one who keeps a dog, suffice it to say they are free from salt, and contain "dates," the exclusive use of which, in combination with meat and meal to compose a biscuit is secured to us by Letters Patent. For sale in cases of 112 lbs. each, F. O. DE LUZE, 509 Ag nt, 18 South William street, New York. Special terms to dealers.

Fleas, Fleas! Worms, Worms!

STEADMAN'S FLEA POWDER FOR DOGS.

A Bane to Fleas--A Boon to Dogs.

This Powder is guaranteed to kill fleas on dogs or any other animals, or money returned. It is put up in patent boxes with sliding pepper box top, which greatly facilitates its use. Simple and efficacious.

Price 50 cents by mail, postpaid.

ARECA NUT for Worms in DOGS.

A certain remedy. Put up in boxes containing a dozen powders, with full directions for use. Price 50 cents per box by mail. Both the above are recommended by *Rod and Gun* and FOREST AND STREAM.

TO PURCHASERS OF

PURE-BRED

ALDERNEY STOCK.

Camilla Lacey, near Dorking, Surrey.

MESSRS WHITE & SONS (of Dorking, Surrey, England,) beg to announce that they are honored with instructions from the owner to offer for sale by public auction, at Camilla Lacey, Westhumble, near Dorking, on

TUESDAY, MAY 22, 1877,

a selection from the celebrated herd, consisting of twelve or fourteen

PURE FAWN AND SILVER GRAY COWS AND HEIFERS, AND ONE BULL.

The Auctioneers have much pleasure and confidence in calling the attention of intending purchasers to the very unusual opportunity afforded by this sale of acquiring stock descended from the most famous herds in the country, and which will be sold entirely in consequence of the farm being overstocked.

Descriptive catalogues will be published in due time, and may be obtained of the Auctioneers, Dorking, Surrey, England. ap7 12 3t.

THE "FISHING LINE."

Brook Trout, Grayling, and Black Bass Fisheries

OF NORTHERN MICHIGAN, VIA

Grand Rapids and Indiana Railroad.

(Mackinaw, Grand Rapids & Cincinnati Short Line.)

Sportsmen who have cast a fly or trolled a spoon in the waters of the **Grand Traverse Region** will come again without solicitation. All other lovers of the Rod are invited to try these waters, wherein

The fish named above, as also **Muscalonge, Pike,** and **Pickerel,** abound.

In no other streams east of the Rocky Mountains is the famous **American Grayling** found in such numbers.

Brook Trout Season opens May 1st. Grayling Season opens June 1st.

The sportsman can readily send trophies of his skill to his friends or "Club" at home, as **ice for packing fish** can be had at many points.

Take your family with you. The scenery of the North Woods and lakes is very beautiful. The air is pure, dry, and bracing. The climate peculiarly beneficial to those suffering with hay fever and asthma.

The Hotel Accommodations, while plain, are, as a rule, good, far surpassing the average in countries new enough to afford the finest of fishing.

On and after June 1st **Round Trip Excursion Tickets** sold to **Points in Grand Traverse Region,** and attractive train facilities offered to tourists and sportsmen; also, on and after July 1st, **Mackinaw and Lake Superior** Excursion Tickets.

Dogs, Guns, and Fishing Tackle Carried Free at owner's risk.

Camp Cars for Fishing Parties and Families at low rates.

It is our aim to make sportsmen feel "at home" on this route. For Tourists' Guide, containing full information as to Hotels, Boats, Guides, &c., and accurate maps of the Fishing Grounds, send to FOREST AND STREAM office, or address

PAINTING.—THE PATRONS' PAINT COMPANY are manufacturing the *INGERSOLL READY-MIXED PAINTS*, and *BRUSHES*, and selling them at full trade discounts, delivering them freight paid, and no money required until the goods are received—making them cheaper than even the material can be bought elsewhere. They are an absolutely pure article, possessing great endurance and brilliancy, and are giving great satisfaction all over the country. We have a Patron friend who saved enough alone on Paint purchased to pay his Grange expenses for a life-time. They also sell *ROOF PAINT* 30 per cent. cheaper than any one else. It is to the interest of all about painting to write and have sent free their book, "*Every One His Own Painter.*" It will save much money, whether you buy their Paint or not. Address, 259 FRONT STREET, NEW YORK.—(*From "The Farmers' Friend."*)

DITTMAR POWDER WORKS
MANUFACTURERS OF
Titan Powder, Dualin, Rifle, and Shot-Gun Powder.
175 WASHINGTON ST., BOSTON, MASS.

The attention of Riflemen and Sportsmen is called to the Rifle and Shot-Gun Powder which Mr. Dittmar has succeeded in bringing to a state of perfection. For cleanliness, pattern, penetration, range, uniformity, little smoke, recoil, report, and heating of barrel in rapid firing, this powder is unsurpassed.

If this powder becomes wet by exposure, it can remain so for any length of time without injury, it being just as good after drying as before.

The Dittmar Titan Powder and Dualin, for blasting and mining purposes, are now in general use, and stand at the head of this kind of explosives. Mar.29 1f

The Hazard Powder Co.,
MANUFACTURERS OF
Gunpowder.

Hazard's "Electric" Powder.

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. *only.*

Hazard's "American Sporting."

Nos. 1 (fine) 3 (coarse). In 1 lb. canisters and 3½ lb. kegs. A fine grain, quick and clean, for upland and prairie shooting. Well adapted to short guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6¼ and 12½ lb. kegs. Burns *slowly* and very clean, shooting remarkably close, and with *great penetration.* For field, forest and water shooting it ranks any other brand, and it is equally serviceable for muzzle or breech loader.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25 12½, and 6¼ lbs. and cans of 5 lbs. FFFG is also packed in 1 and ½ lb. canisters. Burns strong and *moist.* The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard *Rifle* powder of the country.

SUPERIOR MINING AND BLASTING POWDER.

GOVERNMENT CANNON AND MUSKET POWDER; ALSO SPECIAL GRADES FOR EXPORT OF ANY REQUIRED GRAIN OR PROOF MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's agents in every prominent city, or wholesale at our office
88 Wall Street, New York.

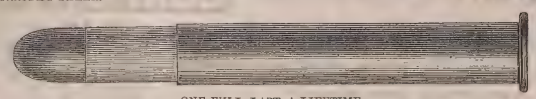
Orange Sporting Powder.

ORANGE LIGHTNING POWDER,
The *strongest* and *cleanest* Powder made. Nos. to 7, packed *only* in sealed 1 lb. canisters. The coarser sizes (higher numbers) especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.

ORANGE DUCKING POWDER,
For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 6¼ lbs. each, and in canisters of 1 and 5 lbs.

ORANGE RIFLE POWDER,
The best for rifles and for all ordinary purposes. Sizes F.G. FF.G, FFF.G, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12½ lbs. and 6¼ lbs., and in canisters of 1 lb. and ½ lb.
All of the above give high velocities and less residuum than any other brands made.
BLASTING, MINING, AND SHIPPING POWDER OF ALL GRADES AND SIZES PACKED IN WOOD OR METAL KEGS OF 25 LBS.
SAFETY FUSE AND ELECTRICAL BLASTING APPARATUS.

LAFLIN & RAND POWDER Co.,
26 Murray St., N. Y.
Sole proprietors and manufacturers of the celebrated ORANGE brand of GUNPOWDER. Recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."



BALLARD RIFLE.

Recoil One-half that of any Other Rifle.

SAFER THAN ANY OTHER.

Perfect Shooting guaranteed by using the EVERLASTING STRAIGHT SHELL.

ONE WILL LAST A LIFETIME.

SEND FOR CATALOGUE.

"Turf, Field and Farm" Badge Won Three Times by a Ballard 40-Cal. Short Range.

W. & C. SCOTT & SON'S.

First Prize Medal and Diploma awarded Centennial Exhibition, for excellence of workmanship and material in their **Premier Quality** and medium grades. Their **New Patent Triplex** Lever Grip Action and **Compensating Lump.** The attention of sportsmen is requested to the above new action. Its superior strength and solidity impart greatly improved shooting powers. Hard hitting, being the desideratum required, is obtained by this powerful gun. Prices of the New Triplex Lever Grip, $175, $225 to $400. Marked the Triplex 10-bores extra. Our highest grade is as usual marked the PREMIER QUALITY.

Extract from FOREST AND STREAM, *New York, December 26, 1876, Contributed by one of the Judges of Awards of Guns at the Centennial:*

This action (The Triplex Lever Grip) combines in the highest degree strength and simplicity, and must rapidly secure the favor of all who test its merits.

COMPENSATING LUMP. Strongly recommended. It is invaluable, and should be ordered on every gun. Costs about $10 extra. Choke-bores, medium or full. Our guns to be had of the principal dealers in the trade only.

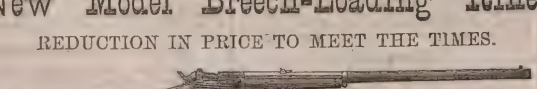
Peabody-Martini Breech-Loading Rifles.

Military, Target, and Sporting.

CREEDMOOR PATTERN



2,000,000 service charges fired from 400,000 of these rifles at our works without accident. 20,000 rounds fired from a single gun without injury to the mechanism, or in the least impairing the accuracy of its shooting. Centennial Commission Report on Awards—Peabody-Martini Rifles: "As a military arm combining strength, simplicity, high quality of workmanship, ease of manipulation, with accuracy and rapidity of fire; using a central fire metallic cartridge, and ejecting the discharged shell unfailingly."

The Peabody-Martini Mid-Range Rifles, victorious at the Centennial Short-Range Match, at Creedmoor, Sept. 12, 1876, distance 200 yards, off-hand; 120 competitors. Members of the American and all the foreign teams participating. Only two Peabody-Martini Rifles entered, winning first prize, $100 cash and gold medal; and 4th prize, $25 cash and gold medal. Send for illustrated catalogue and price-list.

PROVIDENCE TOOL CO., PROVIDENCE, R. I., U. S. A.

New Model Breech-Loading Rifle.

REDUCTION IN PRICE TO MEET THE TIMES.

THIS IS THE "ALLEN" BREECH-LOADING RIFLE so widely known. We have Remodeled it, and make them for either Rim or Central Fire Cartridges.

We desire to call the attention of Dealers, and the sporting community to this Arm. It being one of the first Cartridge Breech-Loading Rifles invented in this country, and being so well known, it needs no special mention on our part to bring it to the notice of the public. For quality of workmanship it is not surpassed, and for accuracy of shooting, which is the paramount quality of a gun, we will challenge all other makers. We make them of the following calibres, viz.: 22-100, 32-100, 38-100 and 44-100. We make a specialty in our 22-100 for gallery practice, and probably no rifle in the country can equal it for that purpose. Our prices are very low. SEND FOR ILLUSTRATED PRICE LIST AND CIRCULAR.

Address,

FOREHAND & WADSWORTH, Worcester, Mass.

Paper and Metallic Shells

FOR

Breech Loading Shot Guns,

Manufactured by the

UNION METALLIC CARTRIDGE CO.,

BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded caps. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with Hobbs' patent waterproof primers, never miss fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers dec23 tf

Hart's Sportsman's Favorite Metallic Shells,

FOR BREECH-LOADING SHOT-GUNS

These shells are easily loaded, and the caps easily extracted from inside. Head solid and much thicker than any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing miss-fires. The Cone is made of nickel, and fastened solid in its place. Neither rusts nor corrodes fast, like movable anvil made from steel. The Nickel Cone also prevents miss-fire when a cap has been left on shell for a few days, which is liable to occur either in steel or iron. These shells are finely finished, and made any length ordered, from 2¼ to 3¼ inches.

Shells and Loaders and Descriptive Price-Lists can be obtained from all the leading Sportsmen's Houses throughout the country. GEORGE E. HART & CO., Newark, N. J.

From Captain Bogardus, Champion Wing Shot of America.

MESSRS. GEORGE E. HART & CO.: Gentlemen—The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly, A. H. BOGARDUS.

COMPLETE REVOLUTION

IN

SPORTING GUNS.

W. W. GREENER'S CHOKE-BORE GUNS have been proved by overwhelming evidence to be vastly superior to cylinder bores for all kinds of shooting, from snipe to duck. (See the letters **from Sportsmen** in the London *Field*, dating from November, 1876, to March, 1877.) Dec. 9 a letter appears from F. Milbank, Esq., M. P., the finest game shot in Europe. This gentleman has killed on his own moor 760 grouse in one day. He says:

"We went out partridge shooting the last week in November. Birds are wild as hawks at this season of the year. Accompanying me were two gentlemen, both first-rate shots. All three of us had equal chances throughout the day. At the end of it one of my friends had seven brace, the other six brace, but the choke had 16½ brace. *I advisedly say the choke,* for I am convinced that the gun alone was the cause of my overtopping my friends by so large a number. I measured that day three successive shots, 65, 71, and 62 yards, and I have decided to use nothing but the choke-bore for the future, for I consider the choke-boring to be one of the greatest improvements made on the sporting gun in modern times."

The Champion Triple-Wedge Fast Gun has made the best shooting at game ever known. It will stand 10 drachms of powder in the paper shell, and can be obtained in the States at from $150 to $250.

For Forest and Stream

THE TROUT BROOK.

YOU see it first near the dusty road,
Where the farmer stops with his heavy load
At the foot of a weary hill;
There the mossy trough it overflows,
Then away with a leap and a laugh it goes
At its own sweet, wandering will.

It flows through an orchard gnarled and old,
Where in spring the dainty buds unfold
Their petals pink and white;
The apple blossoms so sweet and pure,
The streamlet's smiles and songs allure,
To float off on the ripples bright.

It winds through the meadow scarcely seen,
For o'er it the flowers and grasses lean
To salute its smiling face.
And thus, half hidden, it ripples along,
The whole way singing its summer song,
Making glad each arid place.

Just there, where the water dark and cool
Lingers a moment in yonder pool,
The dainty trout are at play;
And now and then one leaps in sight,
With sides aglow in the golden light
Of the long, sweet summer day.

O back to their shelves those books consign,
And look to your rod and reel and line,
Make fast the feathered hook;
Then away from the town, with its hum of life,
Where the air with worry and work is rife,
To the charms of the meadow brook.

CARL WARING.

For Forest and Stream.

Lake Superior in 1860.

[*Continued from May 10th.*]

WHEN daylight broke after we left Marquette, there was nothing to be observed in the character of the scenery more than we had seen on our way from Grand Island, and the weather being somewhat disagreeable we remained the greater part of the time within the cabin. We had for a fellow-passenger the Rev. Mr. Shaw, whose acquaintance we had made in Marquette. He was the Methodist missionary to the Indians at L'Anse—pronounced Lonce—a village on a bay of the same name, which is an extension of Keweenaw Bay. Having seen in the medical journals that an attempt made by the United States agent who distributed the annuities at L'Anse this year had failed to draw from the Indians any information regarding the medicinal properties ascribed by them to plants—they regarding it as an attempt to rob them of their religion—I deemed the opportunity a good one for informing myself on such subjects, and accordingly devoted my time to Mr. Shaw and an Indian on board who could speak English freely. Mr. Shaw was quite communicative, and having succeeded—as *he* believed—in converting some of their "medicine men," he had in his possession some three or four of their medicine bags or talismans, which they use much in the cure of disease. From him I received much interesting information with regard to the superstitions of the Chippeways. The Indian on board was not inclined to be communicative at first, but after a time I encountered him in a quiet place all alone, and on making another attempt, prefaced by a few segars (I'll say nothing of a dram of *iskidewauboo**), I found him tolerably willing to converse. From these two sources I obtained the following account of their sytem of medicine:

Medicine and theology with them are inseparable; the medicine man is a priest, physician and a philosopher. The common Indians suppose that their medicine men are familiar with all the healing virtues of every plant that grows; but it is not likely that they know much more of those things than some of the laity, for they receive little or no tuition from the older priests on anything like Medical Botany, their admission to the fraternity depending more upon their performance of certain ceremonies, by which they are to have their spiritual qualities more fully developed. When a person desires to become a medicine man his first step is to obtain the consent of the other members of the profession; but that for several reasons—a prominent one being the avoidance of a superabundance of doctors—is not easily obtained. If he succeeds, however, his next step is to offer sacrifice, and this is done alone in the wilderness. He is to lie and watch his sacrifice until he dreams of some one of several animals which are named to him by his teachers. During this watching he must fast also, so that some who attempt the feat fail by giving way to the cravings of hunger, and others are reported to have starved themselves to death. Having dreamed of one of the designated animals, he is then to obtain the skin of that one, from which he manufactures his medicine bag. There are other ceremonies to be performed, with regard to which the manner of proceeding is not always the same. This medicine bag is not designed to hold medical plants, but to become the repository of innumerable odds and ends of perhaps a thousand different things which are supposed to have a magic influence over disease, and not only disease, but over men and things in general. These talismanic objects are different in different bags, and depend in great measure upon the conjectures of the individual medicine man, although there are some few things which they appear to regard as necessary to form a nucleus. I forgot to mention some of the animals from whose skins medicine bags are made. They are generally quadrupeds, as the bear, beaver, otter, etc. Their contents are stated as various, as a boar's tooth, the tip of the ear of a deer, the claw of a beaver, certain parts of a sturgeon, pieces of entrails, or viscera of various animals, a crooked nail, pieces of copper and other metals, various kinds of small stones and shells, the claw of a crab, vertebra of a fish, small bits of wood, fur, etc., from different trees and quadrupeds; these are enough to mention as illustrations. The filling of the bag may not be completed for years, for the medicine man fills it by adding to it during his whole life, there being but few things in it when he first sets out in practice. The final initiation, or as we may call it, the conferring of his degrees, is of course accompanied with what they consider imposing ceremonies.

Their manner of treating a diseased patient is generally first to give him infusions or powders of such medicinal plants as they think will be beneficial. If these do not effect a cure, the doctor administers more of the same or other kinds, and uses incantations to promote their efficacy. One thing indispensable is, that the Medicine Man shall eat during the whole or the greater part of the time that the patient is being medicated. For this purpose the patient is obliged to furnish whatever the doctor desires to eat or asks for; and in doing this, the patient frequently disposes of all the little property he may be possessed of to obtain the edibles which the Medicine Man calls for. Occasionally, in severe cases, a consultation of these medico-priests is held. After examining the patient, and ascertaining that the more ordinary modes of procedure have proved unavailing, they may decide on subjecting him to a psychological course of treatment; in other words, to cure him by their united powers of conjuration. For this purpose they form a ring, and place the sufferer in the center; they then walk around the circumference of the circle, and using certain incantations, point their medicine bags at him, and, after a time, perhaps effect a cure. You may smile at the thought of a cure being thus wrought, but it is not the less true that, by their magic, they sometimes produce wonderful effects; thus, by merely pointing their medicine bags at a patient standing in the ring, they can render a limb powerless, or perhaps make him fall as if shot. The immediate cause is, of course, the patient's own imagination, but as that cause would not have been so excited without their performances, it is only common justice to regard them as the producers of the cure when it results, as it sometimes does. An Indian is an imaginative and superstitious being. Two years since (1874), while in a billiard-room in Elk Rapids, two of us sat down to a card-table, and soon caused the phenomenon known as "table-tipping." Some Indians stood by, but when we left the table and it began to follow us, they bolted for the door; from that time it was impossible to get one to shake hands with us; but a half-breed asked my friend if he could not cure him of rheumatism, to which he jokingly said, placing his hand on the victim's shoulder: "There, now, just toddle off and fill up with *iskidewauboo*, and I guess you will come out all right!" The fellow did as was told, for he procured whiskey enough to get drunk, and between his faith and the whiskey his rheumatism was cured, much to P.'s astonishment. Truly, faith works wonders!

As an instance of what may be generally expected of them in any disease of an obscure character, I will relate an incident communicated by Mr. Shaw. His interpreter, a converted Indian, was taken rather suddenly with a pain in his thigh and consequent lameness, although no cause could be assigned for the disease, and no lesion could be discovered by the eye. Mr. Shaw supposed it to be a rheumatic affection, and advised him to use such remedies as he (Mr. Shaw) thought beneficial, but all were without the desired effect. Other means were employed, and weeks passed without amendment, though his health continued good. After some time he conjectured that he was bewitched, and he clandestinely applied to a medicine man. The latter took his magic diagnosticator (which was nothing more than a colored pebble), and after looking through it, he gravely informed the patient that he saw two worms and a stone in his limb. This confirmed the patient in his belief of the skill of the doctor, and thereupon engaged him to remove the foreign bodies. After a long course of medication and conjuration, the doctor could only extract one of the worms, and the patient being but little better he despaired and demanded counsel. Two other medicine men were accordingly called in, and after proper deliberation the oldest and largest took the stone, and looking through it examined the diseased limb. Horror of horrors! He discovered the remaining worm, three stones, and a large piece of iron! No wonder the poor fellow was lame. Each of the other sages in turn examined the limb, and of course they would not acknowledge blindness, so each confirmed the statement of the "big man."

Then came the grave question—the probabilities of cure. The big man having given such evidence of ability, was the one to decide the point, and on his expressing favorable hopes the patient was turned over to him. After a trial of a few weeks the great Medicine Man succeeded in removing one of the stones, but the remaining two, with the worm and piece of iron, resisted all his attempts at extraction. A united attempt by the whole fraternity was therefore resolved upon, but the interference of Mr. Shaw terminated the whole affair.

No. V.

Though I intended to have your readers travel with me around Keweenaw Point, and along the coast to Ontonagon, visiting the copper mines and discussing the natural resources, physical peculiarities and social attributes of the country and its inhabitants, I find my notes in such confusion that I have abandoned the idea of arranging them for the present, owing to lack of time. A little later they shall be forthcoming; meantime, with your permission, I will take the Forest and Stream, its readers and myself, back some sixteen years and write you a couple of winter letters from Marquette, the material for which is culled from old letters of your humble servant.

Tourists seldom winter in the Upper Lake region, but I found it conducive to health and not disagreeable. Of the doings I refer you to the letters:

Marquette, Lake Superior, Dec. 22, 1860.

Mr. Editor:—I wish you a Merry Christmas and a Happy New Year! A little in advance of the time, indeed, but you will find it in good time enough, probably, before it reaches you. We have to do such things in the Arctic Regions a little before the real time; this is "taking time by the forelock" in order that the sentiment may get thawed out by or before its arrival with you. Did you ever hear of words freezing so that when men stood on the street in conversation their words congealed, as uttered, and fell at their feet to such a degree that after twenty minutes' conversation a man might be said to be up to his knees in his own eloquence? Well, such is about the condition of things here, and has been, with the exception of about eighteen hours, ever since I returned here last month. During all the time—nearly five weeks—the mercury has been down to, or below, zero. Even now—while I write—I send you but a very small letter, yet, by the time it reaches your more temperate climate the heat will have so expanded it that the wrapper will be open at the end! Now, friend Hallock, be so kind as to put the compositor in a cold room while he sets this up, or you may not find room for it after its dilution. This would be a capital place to send some of the old puritanical sermonizers; their long-winded expositions would, in this temperature, become concise discourses. This would be nearly the only appropriate part of the country to send for perusal that Alexandrine work—*The Coast Survey*. It would here become a mere two-and-six-penny duodecimo. Wonderful, indeed, is the condensing effect of cold illustrated up this way. At Portage Lake, where the temperature is a few degrees lower than here, its effects are visible on Old Father Time himself. This week has been so contracted that, as I am audibly informed, they have no Sabbath left, but still adhering to old forms, the people yet devote a seventh part of the week to "killing time!"

When here last August I was in love with the place; and that must have been true love, for its course, it is said, "never did run smooth." My voyage here on the "Planet," last month, was forcibly illustrative of that adage. During our passage we had to throw all our freight overboard to appease the hungry sea, and even that did not satisfy the monster, for on his own account he took possession of both our smoke-stacks and a part of the upper cabin. We barely escaped his capacious maw by thus sacrificing to him some thousands of dollars' worth of provisions. The steamer Cleveland, which was in our wake when the storm commenced, had also to throw over her deck-load and part of that in her hold.

Everything looks dull here now, there being nothing but wind upon the lake, and the cars having stopped running on the railroad. There are but few horses here, comparatively, and you will not wonder when you know hay is

*Iskidewauboo—fire-water—general name for liquor.

worth sixty dollars per ton. The mines are wrought during the winter with about the same force as in summer, but no ore is brought down. The miners are seldom here, there being stores, hotels, saloons, etc., at Negaunee—the village of the mines. We get a mail once a week through by Bay de Noquet. The lumbermen of Bay de Noquet have shanties in forty miles in this direction, and there is a road the greater part of the way from here to the shanties, so that with the exception of some sixteen or eighteen miles, I believe, there is a kind of road for the mail carrier, who uses a horse and *jumper* or *pung*; that part of the route where a horse is not available dogs and toboggins are used to carry the mail-bags. It takes letters about twelve days to reach us from Detroit. Notwithstanding the apparent dullness of the place, the people keep up considerable social activity in the way of parties for dancing, parties for euchre, parties for fishing—the finny tribe being caught in Dead River through holes in the ice—and lectures before the Literary and Scientific Society, not to mention the excitement of riding down hill on hand-sleds every evening. At the latter item you may be inclined to smile, but if here, you would see not merely boys and girls, but full-grown and married ladies and gentlemen indulging in the sport. There is a long hill, up which the principal street runs its whole length, about three-eighths of a mile, and for two or three hours every evening you may see the excitement, in which in your younger days you may have worn away the amplest part of your indispensables, and indulged in with many extras and keenest relish; and why should we not romp and run, and dance and shout, and feel like school-boys once more? Shut out from the world, and in by ourselves, we have none of the political and financial panics which trouble you to make our hearts heavy and our pockets light. If we have only enough to last till spring, we need not borrow trouble. Let the money panic shake down the heaviest houses in Detroit or New York, what care we even if they be our creditors? They cannot send their processes and their drummers to compel us to make assignments, or to take away our means before spring; and spring is afar off. We are clear of your sheriffs and your duns, and your *town bailiffs* till then. What care we if the political panic throw stump orators into spasms, or give statesmen the colic, or the States themselves such an emetic that they throw up the Constitution? You cannot call militia from here before spring; and we don't care a tig for the fuss, but think that as likely as not the whole trouble will be over before we have anything to say about it. Thus, perched upon our hand-sleds, we sweep down upon and past you, shouting—"Clear the way!—look out for your shins!—fire away!—whew!"

Say what you like, we are the nearest to philosophers of any in Michigan, and like old Falstaff, we say, "A plague on this trouble, it blows up a man like a bladder; clap to the doors, hostess!" Shut out trouble, shut out bills, bailiffs and recruiting sergeants, and bring on the hand-sleds!

There are more ways than hand-sleigh riding by which men get capsized among you of the lower world. I'd rather get a toss from a hand-sled any day than from a political hobby. And oh, what a tumbling there is going on all over the Union at present among the holders and seekers of the loaves and fishes! Some of them go quite as much heels-over-head in the gutter as we do in the snow banks. We, indeed, wear out a part of our pantaloons, but in many of their cases the destruction is carried still further, and I fear the coat skirts will not hide the damage. After sliding down we scramble back again to the hill top, but they, poor fellows, have taken their last slide. The people here talk politics, of course, but there does not seem to be any great concern about the matter. In fact, I think the Burch divorce case caused more talk than the political panic. The Republicans here are, I suppose, like those of other places, silently rolling up their sleeves for a plunge into the official dish. The Democrats here, as elsewhere, ran a kind of fusion ticket, thus virtually giving up the name; they can hardly be said to have any politics left, but are like old Mayor B——, who some years ago, "out West," ran as an independent candidate. During his canvassing tour, while making a stump-speech, some one in the crowd called out, "B——, what are your politics?"

"Gentlemen," responded the Mayor, "I have no politics."

"No politics!" rejoined the other.

"No, gentlemen," said he, "not a d——d politic."

The Democrats up here have become somewhat like Mayor B——. Talking of the ups and downs of tumbles from the white snow banks, and tumbles from the "White House," prompts me to give you an account of a tumble "in real life," as I understand it. I had occasion to-day to ride out some six miles; and after putting on as many coats and wrappers as would convert a Yankee into an alderman, I repaired to the livery stable and had a steed caparisoned and attached to what had once been an elegant cutter. That it was old was no disparagement in my eyes, as I am noted for my antiquarian proclivities; the organ of veneration is naturally large (Fowler says so; so, of course, it's true) in the heads of our English progenitors; and we inherit that just as we do the quality of "brag," though perhaps we beat them a little in the latter. We reverence age—large exceptions here, of course—and we cling with affection to an old hat, coat (generally for cogent reasons), or pair of boots, particularly in the latter case if we are d— blessed with corns. But to leave those tender points and recur to our vehicle. I really prized the outfit highly. The cutter was long, and my whip was short—a mere stub. The livery man had evidently mistaken me for a lawyer, and given me an opportunity to indulge my favorite habit of "making points;" for at each stroke I made at the horse my stub of a whip fell short of the mark, and I merely "made a point" at him. He appeared to understand the matter, and took it coolly, merely taking a jig-jog gait, and pointing his caudal attachment at me as I pointed my whip at him. We got through and began to return, but I could not endure the indignity offered to me by the easy-mannered animal; so, bending reverentially (revengefully, I mean) upon my knees in the front of the cutter, I proved to him that I could *apply* my points at times. Away he flew like the wind, I applying the *vis a tergo* until having given him what I supposed sufficient impetus to carry him and me home, I rose; the cutter bobbed; I soused into my seat, and carried seat and back over behind the cutter. I hung on for dear life, and called to him in accents of earnestness to—whoa! Repeated entreaty, coupled with expressions of the powerful attachment which bound him to the vehicle, and the cords of affection which I held in such tenacious grasp in my hands, eventually prevailed upon him to suddenly slacken his pace. A moment's reflection was sufficient for the sagacious animal, and a most powerful conviction of his heedlessness must have at once possessed him; for he not only stopped going forward, but actually retreated with such rapidity that my head, which had before nearly touched the ground, now actually collided with it, my heels being yet upon the back of the cutter. Another lunge of the conscience-stricken animal backward, and my legs were doubled over my head, so that my ten inferior digits pointed heavenward; and I was fast being not merely overted, but even in the way of being retroverted. Whether man was ever intended to assume this position when he wished to decide with preternatural rapidity, or whether the fire which flashed from my eyes illumined my course, or whether the pressure of the cutter against me suddenly expressed my sentiments, or not, I shall leave physiologists to decide. Certain it is, however, that I instantly adopted the proper course at the proper moment: and with all the breath that was left me, and all the emotions excited by the occasion, I implored the animal to proceed; at the same time relaxing my hold upon the lines. As if seeing the matter in a new light, he sprang quickly forward; and when, after disentangling myself from the seat and the robe, and I had made an exchange of position between head and toes, I caught a glimpse of the binder part of the cutter as it disappeared like lightning at a turn of the road about sixty rods ahead.

Seeing that my letter is already of a reasonable length, I shall let other matters remain intact for this week, and wish you a hearty good bye. ARCHER.

THE RANGELEY LAKE REGION.

BY THOMAS SEDGWICK STEELE.

(Continued from our last issue.)

CAMP KENNEBAGO, RANGELEY, Franklin Co., Me.

NO small part of the superintendent's daily duties at this camp is to attend to the wants of the "inner man," and a dozen or more anglers whose appetites are sharpened by this clear atmosphere will give "steady employment" to one so situated.

Most of the trout which appear on our table weigh from one to three pounds each. If, in capturing a trout, he is not "badly hooked," as we say, he is immediately placed alive in our cauls and will so remain until our departure, but about half are killed in landing, and from this source is derived the supply on our table. In addition to the usual way of broiling and frying them, a favorite method here is to boil them in cream, which to my taste far exceeds all others. We have occasionally longed for a fry of little trout, three to four inches long, so common in our native State, and we have frequently satisfied ourselves, as they can be caught in abundance within a stone's throw of camp. Provisions in this part of the country are decidedly cheap. The best of mutton and beef costs eight cents a pound, butter twenty-three cents a pound, milk four cents a quart, white clover honey twenty-five cents a pound, while eggs are only thirteen cents a dozen.

On Monday, the 14th inst., a party of us ascended the Kennebago River, a distance of eight miles. The river has a succession of falls and rapids, over which a boat passes with great difficulty. The guides are armed with poles twelve feet in length, which terminate in sharp iron spikes, with which a secure hold can be had on the rocks below. Up this lovely stream we ascended, rapid after rapid, fall after fall, until we reached the Screwnager Fall, when all of us were obliged to throw ourselves into the water up to our waists and help the boats into the deep, still water beyond.

On our return, some one suggested a race. First one was ahead, and then by some slight manœuvre another got the advantage and shot beyond him, and when we came to shallow places we sprang into the water and almost carried the boat bodily over them, for what cared we for getting wet, so long as we won the race. In this way we made sixteen miles that day on the river, caught some twenty trout, and returned to camp at night tired, but in all the better health for our excursion.

Major Gilbreth, United States Army, arrived, and at night our number was further increased by Mr. A. H. Badger, editor of the Maine *Farmer*, who came in company with Baron Hayes and Messrs. Osborn and Prescott, all of England. The three last-named gentlemen had just arrived in the country on a fishing and hunting trip, and had been introduced to Camp Kennebago by a special permit from R. G. Allerton, Esq., secretary of the association.

We added to our caul to-day sixteen trout, the largest of which weighed one and three-quarter pounds.

This (Wednesday) morning we have packed our baggage and propose to return home by the entire chain of these Rangeley lakes, a trip upon which very few of the visitors at camp ever venture. Oh! how we regret parting from these pleasant scenes and delightful friends, which we have enjoyed for two weeks past. But business calls, and we must respond. So, shaking hands with our friends, who stand grouped at the end of the long piazza, and giving them three lusty cheers, we bid farewell to Camp Kennebago.

After bidding our friends good-bye, we placed our baggage aboard our small row boats, and with the guides at the oars soon passed down the Rangeley stream, and then out into the Cupsuptic Lake, through the narrows, into the Mooselucmaguntic Lake, from whose waters we had taken so many a big trout during our three seasons in this region. It was a misty morning, and the vapory clouds hung low on the sides of the mountains, but through the haze we could now and then discern old Bald and Kennebago Mountains, to whom we waved a parting adieu. Across Mooselucmaguntic Lake we pulled, and reached the "Upper Dam" at 11 A. M. The annual booms of logs having all passed these dams, the gates are consequently opened, making (as I have mentioned before) a difference of fifteen feet in the height of the water, for within an hour after shutting these gates (at any time) the water will rise four feet. This resulted in our being obliged to transport our trunks and boats about a mile across the carry to the Molechunkemunk Lake. The means of conveyance was singular indeed:—a great heavy sled (evidently made on the grounds), to which with the roughest kind of harness were attached a pair of oxen. On the sled the several trunks were arranged, and on top of all were placed our boats. Over the trees and great rocks, some of the last two feet high, the oxen dragged the load, swinging their bodies from side to side and gazing at us in their usual meek way, while with rods over our shoulders and traveling-bags in our hands we walked by their side, smiling to ourselves at this new way of transportation. There are one or two low wood houses at this place, the largest of which is kept by a comical old Frenchman by the name of McCard.

We retained one rod apiece from our baggage, so as to troll all the way down the several lakes, and in crossing this last one we had been so fortunate as to land five fine trout, to which number we added on the other lakes.

At the opposite side of the dam is a very comfortable house called the "Boston Club Camp," while at the right of the landing, on Molechunkemunk Lake, is a camp consisting of eight houses, built by a Mr. Benton of Philadelphia, and where he spends three months of the year. Here we transferred our baggage from the sled to the boat, and, after finishing our dinner, embarked again on another pull of eight miles to the "Middle Dam."

Mount Observatory at the head of Molechunkemunk Lake is one of the finest bits of scenery in this vicinity, and on this occasion heavy clouds floated across its sides; but peeping through all was its lovely blue cone, the light and shade making constantly changing pictures of great beauty and variety.

Two and a half miles down the lake on the east side is one of the most complete camps (every house is called a camp in this region) to be found in the entire trip, built by Mr. J. P. Whitney of Boston. The house is two stories high, containing eight rooms furnished with sets of French furniture, and all the luxuries of a comfortable, modern home, and many a friend of Mr. Whitney from the "Hub" enjoys himself at this place.

The coast on the west offers few specialties of picturesque beauty, as the "primeval wilderness" extends down to the water's edge, but as you reach the landing at the Middle Dam, the extended view across the lake to the south is remarkably fine. We occasionally met parties camping out along our route, who fired us a salute from their small armories as we passed, which we acknowledged by swinging our hats. We reached the "Middle Dam" on Welokenebacook lake at 4 P. M., and our landing was for a time disputed by two large bull dogs who made themselves remarkably "numerous." But soon the landlord made his appearance, and, driving off the dogs, welcomed us to "The Angler's Retreat," which consisted of four wooden houses, one of which is built of rough, unhewn logs. On top of one of the houses is a large bell which is rung at meal times to call the anglers on the lake. The buildings contain nine sleeping apartments, and the addition of our party made fourteen to occupy them, so some of us engaged favorite corners on the floor. The principal room is low, smoky and greasy, a stove in the center, gridirons, pans, and other household utensils arranged on the sides, while across the beams over our heads were oars and numerous fish rods. The meals were clean and good, although the man who waited on the table divided his attention about equally between ourselves and a big pipe he was enjoying, and the numerous empty whiskey bottles out in the back yard showed too plainly the taste of its boarders.

How a man in this region, with all the pure, exhilarating effect of its atmosphere, can desire to further stimulate with liquor, is more than the writer can imagine, but I suppose after the clean, wholesome and temperate quarters at Camp Kennebago the contrast seemed greater. After supper we bid our guides good bye, and their four boats were soon lost in the distance on the way back to camp.

Any one that desires can stop at this "Anglers' Retreat," board $14 per week. The fishing is good and within a radius of half a mile.

After breakfast, Thursday morning, our baggage was put on another conveyance (this time a horse and wagon), and hauled four and a half miles down to Rapid River, while we followed on behind. What an enjoyable tramp that was through the woods.

Away we went in "Indian file," with our light baggage and rods over our shoulders, whistling the "March from Faust," to which we all kept step. We stopped for a moment's rest at the "Forest Lodge," built by Dr. Green of Boston, then on we trudged to "Cedar Stump," and after a row of one and a half miles down the river, passing over one lovely fall on the route, we went on board the "Steamer Diamond," and witnessed for the first time in two weeks evidences of civilization. A large number of other sportsmen from various points in this vicinity, with dogs, guns, and fish rods, came aboard, and the little steamer, about fifty feet long (which we found could run on two feet of water), pushed out into Umbagog Lake.

This boat runs to Errol Dam, Magalloway River and Upton on Tuesdays, Thursdays and Saturdays, and offers a fine opportunity to enjoy excellent fishing without much trouble or expense, although, of course, it is not equal to the lakes above.

Umbagog Lake is the lowest of the six Rangeley Lakes, being only 1,256 feet above the sea level, while Rangeley Lake is 1,511 feet, Cupsuptuc 1,486 feet, and Molechunkemunk and Welokenebacook 1,456 feet. The scenery is beautiful, but not equal to the other lakes.

From Lake Umbagog we passed into the Androscoggin River and were soon at Errol or Lower Dam, and then a short walk brought us to the hotel. On inquiring about the fishing in this locality, we learned that in addition to the trout, a gentleman yesterday captured in Umbagog Lake three pickerel.

It seems some men were arrested last year for fishing out of season for trout, and revenged themselves by putting pickerel in the lake. We all offered to pay the funeral expenses of those men! In all probability the pickerel in time will run up the entire chain of lakes and destroy completely all the trout in their waters.

By private teams we started for home, over the mountains twenty miles through the celebrated "Dixville Notch" to Colebrook, thence by stage fourteen miles to North Stratford, and next day by the Grand Trunk Railroad to Grafton, where we changed cars for the Boston, Concord, Montreal and White Mountain Railroad.

So ended one of the pleasantest trips the writer has ever made to this, the greatest of all trout regions.

I untie my leader, put my pet flies away in my book, unjoint my rod, and reel home the Rangeley Trout Tales.

For Forest and Stream.

SHOOTING ON PIGEON CREEK.

TWENTY miles in nearly two hours from Port Hope to Omemee, on the Midland Railway, seemed a very long time for impatient duck hunters, but at last we reached our destination by train, and pushing our canoes into Pigeon Creek at Omemee, we proceeded down stream by moonlight, determined to make Musk Rat Island, eleven miles down, before camping, which we did by half-past eleven at night, rather tired and with a good appetite, determined to make things warm for ducks next morning. As duck shooting here at that season depends principally on the morning and evening flights, and our chance for ducks was very slim until evening again, we concluded to paddle down to Flood's Bog, three miles further, and try our hand at snipe, which we did. After an hour's good shooting, we proceeded to push out of the bog and returned to camp, which we reached about half-past five. Despatching a hasty supper, we started for Clanseys' Pond, where we expected lots of ducks would come in to roost, anticipating good shooting. But on getting nicely settled an hour before dusk, we were chagrined

to see half a dozen canoes coming up from Smith's Lodge, and pushing into the marsh on all sides of us, they having been there the evening before, as we soon found out by no ducks coming in of any account, our pile being three black ducks, two wood ducks, and one teal, making five altogether. Theirs was three between the whole party. We then proceeded back to camp, very much discouraged with our first day's hunt.

Next morning we drew stakes and started further down the river, pulled our canoes across the floating bridge, and after an hour's steady paddling pulled up at the Twin Islands, at the head of Pigeon Lake, pitched our tents and were having a quiet chat with our old friend Bill Taylor, the Indian, whom we chanced to meet there, when Bill's hawk eyes spied a flock of ducks coming up the lake directly toward us. We watched them until they got opposite our Island, when they sailed into a little bay and all came down with a splash, without any fear whatever; a very unusual circumstance, as Bill said, for black ducks, as they generally take a circle or two around before alighting. Bill then volunteered to examine the marsh for our benefit, and soon returned with the information that lots of ducks had roosted there the night before, and as we scarcely ever knew him to make a mistake, we concluded to shoot there in the evening.

It now being about two P. M. we started down the lake, one on each side, paddling in and out of the little bays, killing a duck now and again to pass the time until the evening flight. Having paddled down about three miles we concluded to return, and paddled back to our shooting ground for the evening, which we reached about five o'clock. Selecting our positions we waited patiently for half an hour, when we were rewarded by seeing seven wood ducks sailing in, but as they were rather scattered we only got five with four barrels, and as the ducks were flying in flocks from two to about five and rather scattered, it was necessary to single out one bird at a time or get none at all. The birds then commenced flying with a vengeance. It took us all our time putting cartridges in our guns, and it was a continual "bang, bang," until too dark to see, although we could still hear them whizzing around us. I assure you we had enough shooting for one evening, for shooting four drachms of powder out of a seven-pound gun for two and half hours steady, shakes a man up pretty well.

Picking up the rest of our ducks we pushed back to camp and found to our satisfaction that we had forty-three black ducks, twenty-six wood ducks, eight pin-tails and five teal —eighty-two in all, besides losing a good many wounded ones, on account of the rice being so tall—all single shots after the first five killed.

After a few hours' rest we again drew stakes and started on our fifteen-mile paddle back to Omemee, which we reached by daylight next morning, just in time for an early train home, well worn out, but on the whole very well satisfied with our two days on Pigeon Creek.

For Forest and Stream.

A GOOD BEAR STORY.

FOR many years there lived in the town of Brighton, Vt., a man by the name of Seneca Foster. Although a man of no more than medium size, he possessed the most wonderful physical vigor and endurance. No exertion or exposure seemed to impair his health. Mr. Foster's son Jack inherited much of his father's strong constitution and elastic frame. One summer day Jack was out hunting in the vicinity of Island Pond. He tramped long and far, but without success. The woods seemed destitute of game. Finally he became discouraged and started homeward. On his way, as he was passing a dense thicket, he saw two bear cubs asleep. They lay partially on their sides with nose to nose. From one direction it was easy to reach them. He knew he could kill them with his gun, but he would like to capture them alive. The cubs were large enough to show fight, and perhaps their dam was within call ready to interfere. Jack peered cautiously about, and not seeing the mother bear, decided to risk the attempt. Placing his gun in a position where he could swing it under his arm after he had secured his prey, he crept softly to the sleeping animals, and suddenly grasped each by the nose. He expected in this manner to hold them so tightly that they could not squeal. One of them he succeeded in holding in that manner, but the other slipped from his grasp. Nothing daunted, Jack caught him by the hind leg, secured his gun, and started on the run for home. But the end was not yet.

The cub, not liking to be carried by the hind leg, set up a loud complaint, and the old bear immediately replied—she was close at hand. Jack heard her crashing through the brush after him, and he knew now that success depended on his speed and muscle. It was fifty rods to the clearing, and he had not more than ten rods the start. It was a case of life or death, unless he relinquished the cubs, and he was not the man to do that. Encumbered as he was he ran like a hound; but the bear gained on him, and when he approached the edge of the woods Mrs. Bruin was just at his heels. Jack understood his peril. There was a high log fence just at the edge of the clearing; fortunately a large log lay aside the fence. With one tremendous bound Jack leaped on the log; another muscular bound carried him over the fence into the field. The bear was on the fence as soon as Jack struck the ground. But she hesitated a moment about following him in the open field, and he sped away so fast that she finally turned back into the woods, and Jack escaped to relate his exploit, and verify it by the exhibition of his captive cubs.

On another occasion Jack was in the woods, on his way home from sap trees, where he had been boiling maple sugar. It was a mild day in March. The snow was six feet deep, and the warm spring air had softened the surface so that no one could walk on it without snow-shoes, a pair of which Jack had on his feet. He was unarmed. As he walked on he came to a fallen tree directly in his way. He stepped upon it, but just as he did so a large bear rose up behind it, and rushed at him with open jaws. The warm air had roused the creature from her winter sleep, and she was furious with hunger. Taken wholly by surprise Jack gave a tremendous leap, which carried him a distance of ten feet from the trunk of the tree. But he sank deeply into the snow, and the bear was upon him before he could extricate himself. Then the battle began, man and beast rolling over and over each other in a desperate struggle. As often as the bear tried to seize him with his teeth, or overpower him with the fatal hug, Jack would save himself by kicking her on the nose with his snow-shoes. Finally, with one fierce plunge of claws and teeth, the brute fastened upon Jack, and failing to hold him, tore off almost all his clothing at a single swoop. Fortunately just at that moment he hit the tip of her nose with a most powerful kick. A blow on the end of the nose causes pain so acute as to disable a bear for a time, and it had that effect in this case. The brute gave back a little, and while she was wincing under the pain, Jack regained his feet and got several steps away. His assailant started after him again, but the snow was so soft she almost buried herself at every step, while Jack walked on the surface and escaped. So his snow-shoes, which rendered him a clumsy fighter, finally saved his life. BEST GUN.

LETTER FROM GUYON.

CORINTH, MISS., April 26, 1877.

EDITOR FOREST AND STREAM.

"Lord, thunder us up to de ploughin' match;
Lord, peerten de hoein' fas';
Yes, Lord, have mussey on de Baptis' patch—
Dey's mightily in de grass, grass,
Dey's mightily in de grass."

—Uncle Jim's Baptist Revival Hymn.

Nor is this the burden alone of Uncle Jim's song at this time. His white "bredren" are mightily in de grass on account of the continued wet weather having stopped all work in the fields. The weather is what a young lady I once knew would probably call "excessively moist." She was walking home one evening, with her Adolphus by her side, when they mistook a small pond of water for a smooth stretch of sand, and in they "plunged boldly, no matter how coldly," about knee—well, *I* wasn't there, and don't know exactly how deep. Catching her breath in little gasps, the charming creature cried out, "Oh! dearest, it is so *excessively moist*."

Well, this weather is excessively, exceedingly and eminently moist. The fishermen can't go a-fishing on account of the muchness of the waters. A *plesiosaurus, ichthyosaurus*, or any other kind of a saurus, might disport in the spring branches hereabouts at this time. We can't go gobbler hunting on account of the game law in this State, and the *Gallopavo Temessensis* is some distance away. Some parties I want it distinctly understood that I was not along—went to McNairy a few days since, to a place where the gobblers were so thick—according to the report of a reliable gentleman—that you could stir them up with a stick. They found one old gun-shy gobbler that the oldest turkey hunter in North America could not have called up—"only this, and nothing more." Yes, they did see three deer, all little fellows.

A friend, who lives in Tennessee, twelve miles from this place, has bagged nine fine gobblers this spring. He has been as far as ten miles from home after some old fellows, that were exceedingly shy and hard to call up, and generally succeeded in getting them. I am not one of those who believe that spring hunting after gobblers will ever materially lessen the number of turkeys in a country. It is only the very fewest number of sportsmen who can call up and kill a gobbler. If the hens and young ones were not shot and killed out of season, the finest of all game birds would never be exterminated.

Quails have not paired off yet, and there seems to be a fair supply, notwithstanding the hard winter. The day before yesterday I drove out six miles into the country, and let my dogs follow to get a good run. They found four full coveys along the roadside, although I was driving at a good, slashing rate, and they did not have much time to range. One of the bitches made one of the prettiest points imaginable. She was going full speed, down wind, when she got the hot scent from a covey, about fifteen feet away, and nearly behind her. The scent seemed to strike her just as her fore feet came down, and she was whirled round—as the boy said about the horse, when he was turned with his head from the manger—with her head where her tail ought to have been. Her front claws actually tore up the dirt in the road, so sudden was her headway checked, and she stood immovable, pointing square back down the road in the direction from whence she was running.

I have a turkey-call, made from the thigh bone of a puma, with a small cane inserted in one end through a wooden plug. It was given me by my friend Doctor P. of this place, who is perhaps the best turkey hunter in North Mississippi. He knows more about the "human nater" of the turkey, as the darkey says, than any man I ever knew. GUYON.

For Forest and Stream.

THE OLD PORK BARREL.

NO doubt many of the readers of FOREST AND STREAM who were born in New England or Northern New York are calling to mind about these days some oft-visited brook or pond near their boyhood's home, where Saturday afternoons and in vacations they spent many a happy hour, and were nearly certain of securing a nice mess of trout. How well I remember a favorite haunt of mine, about a mile from the suburbs of our village, known variously as the "Forge Pond" and "Old Salter's Pork Barrel," deriving its names in the one case from the ruins of an old forge near by, and in the other from the fact that from its depths old S. was accustomed to procure supplies. It was artificial, being a mill-pond, but nevertheless beautiful, surrounded by heavy timber; the waters were clear and very cold from innumerable springs boiling up at the bottom; here and there an old stump reared itself from the surface, the nooks and holes among their roots making innumerable hiding-places for the speckled beauties; and for means of navigation there was an old log about four feet through, with a few sprawling roots at one end to keep it steady, which Uncle Eli, who lived at the Mill House, kept fastened with padlock and chain, and occasionally leased to the boys at twenty-five cents per day. What happy hours have I spent upon that old log, when there was just wind enough to sing through the pines and make a light ripple on the surface, and the trout all mad because they could not get hold first!

A worthy doctor from our village leased the pond and privileges for two years once, and had exclusive control of the fishing for that period; and how George F., my fishing chum, and I hated him during that time. He moved away from town in the winter of the second year, and George and I took possession of our old "stamping ground." During the spring the Doctor came back on a visit, and the next Saturday after his arrival, early morn found me tramping over the well-known road to the pond, with a heart as light as the birds among the trees, prepared to spend the day. After interviewing Uncle Eli and securing the key, I soon overcame the *vis inertiæ* of the old log by means of a long pole, and fastening it to the top of a projecting stump, commenced casting. The air was so still that they bit slowly at first, but soon a light breeze sprang up, and a ripple came dancing over the pond and the fun began. Attracted by a noise, I looked up and saw a light carriage drive up. The horse was fastened, and three persons with rods in their hands came hurrying down toward the pond, and who should it be but the Doctor with a friend, come to try his former preserve. Now for retaliation! I watched them as they came down to the spot where the log is usually fastened, and can imagine their look of disappointment as they discover the log up the pond with a long-legged urchin balanced thereon. "Ah!" Doctor, I think to myself, "how many times within the past two years have I traveled along by on my way up the brook, and watched you on the log with the same feeling that is now passing through your mind." Soon the Doctor's voice rings out: "Hello, bub, ain't you coming in pretty soon?" Just then I have a strike, and after playing him around the log a few times I hold up a lovely half-pounder, and halloo back: "No, I haven't but just come," and prepare for another cast, when again the Doctor's voice breaks the stillness: "Bub, what will you take to let us have the log?" "Couldn't think of it," goes back from bub. Then from the Doctor: "We'll give you a quarter." No response. "Fifty cents." No reply. Then the Doctor disappears, and presently his face shows itself through the bushes on the shore just opposite me, as with a whoop I land a beauty that will tip the scales at twelve ounces. Then begins a confab in which the Doctor does most of the talking, and is conducted something like an auction, the bids for the log finally reaching three dollars: "but no; money can't hire that log to-day, Doctor." Then came threats and abuse, and finally discouragement, and as the Doctor and his friend are about to depart, I volunteered the information that there is good fishing up the brook.

What a magnificent string I toted home that night, right down through the main street—no cutting across lots, and home over the back-garden fence, for fear some one would holler, "Fritz, where's your fish?" and when I told the boys that night how I had beaten the Doctor, there was great joy among us.

But the dam by the old mill broke away long ago, and the cattle now feed where the front sported then, and one by one we loose our old "stamping grounds," but we can revisit them in memory, which is one great comfort. FRITZ.

Fish Culture.

A NEW FOE OF THE SHAD.

WEST MERIDEN, CT., May 1, 1877.

EDITOR FOREST AND STREAM.

Perhaps you may remember my protest against the indiscriminate stocking of our waters with black bass, which was published in FOREST AND STREAM about one year ago, and in which I stated that I believed it to be a great mistake to place black bass in ponds or streams which were already well stocked with good and thriving fish. I send you the following article, taken from the Hartford *Times*, which may be of interest to those who delight in the success of our fish culture:

"It is the belief of some persons who have given attention to the subject that the introduction into the Connecticut River by the Fish Commissioners of the black bass has had the effect to diminish the number of shad this year, and also to lesson very materially the number of the striped bass. Some three years ago, if we remember, the Commissioners stocked the river with black bass. This is a well-known game fish, whose capture affords sport to the fisherman in those waters which have been stocked with this variety of fish—as the beautiful Waramaug Lake, in Litchfield County, and other landlocked waters, where the black bass, once introduced, multiplies rapidly, and exterminates most other kinds of fish. The pickerel, we believe, he does not succeed in 'bulldozing;' but the perch and other fish suffer. Since he has had time to grow and multiply in his new quarters in the Connecticut, the shad, this year, begin to show the effects either of the black bass or some other scourge, for the shad 'catch' this year threatens to be only half as great as it was last year. In the Hudson we think no black bass have yet been introduced, and shad there are selling at $8 a hundred, so abundant are they. Here, in the old-time home, the Connecticut, famous for the best of all shad, the supply, for some unknown cause, is certainly much diminished this year. Owing to the stocking of the river with new shad-spawn, above the Holyoke dam, a few years since—and with the building of an apron on the dam—the supply of Connecticut River shad last year greatly increased, and the fish were bigger and finer; now there seems to be a sudden falling off, beyond the usual run. The voracious black bass, though very destructive, is not their only enemy; the young shad are exposed to wholesale destruction even in the germ-form, for the up-coming shad, that return in April and May to the favorite upper waters of this old river to spawn, are followed by a silent army of eels, who devour all the spawn that is dropped along the river bottom on the way up. The young shad that are born are promptly assailed by a number of deadly foes, some of whom are scarcely ever seen and almost unknown even by fishermen. The burbot is one of these; and his more prolific congener, the eel, is a great destroyer. To let loose upon the hunted shad another and still more destructive foe, who slays as many as the 'pounds' erected off the mouth of the river, is certainly rather hard upon him; and if the black bass is the offender, he threatens to exterminate the most delicious of all the fish that swim. One victim of the rapacity of the black bass is said to be the striped bass. This is a very fine table fish, which has sometimes been caught in the Connecticut River near Hartford, weighing upward of 70 pounds. His ordinary weight, when caught here in the river, ranges from about eight to twenty pounds. Stuffed and baked, or simply boiled, he is a delicious fish; and he is quite as good boiled, with proper accompaniments, as he is when baked. If, as we hear asserted, this fine fish, like the shad, has been more decimated by the black bass, it is time to do what can be done to destroy the bass—for they are not as good a fish as the striped bass, nor nearly so good as a nicely broiled shad."

Now, if the black bass are so destructive to shad and striped bass, is it not reasonable to suppose that the salmon (with which our river has been stocked) will also be destroyed? Perhaps FOREST AND STREAM will give us some light on this matter, for should the above prove true, it will be a serious matter indeed. VON G.

NOTE.—After a careful examination of the opinions given in the United States Fish Commissioners' Reports for 1872-73, we find that the weight of judgment does not sustain the fears above expressed. The black bass, although voracious, does not confine himself exclusively to a diet of shad roe and fingerlings, minnows and sprats. Crustaceans (crayfish, dobsons and the like) are the natural food of the bass. He

will forage for those always in preference to the minnow, though he will take fish for a change, or, in fact, most anything eatable. We think too much sin is charged to the black bass. We should hesitate about putting him into confined waters along with other fish; but in a river as wide and long as the Connecticut, with the whole ocean at its mouth, we cannot conceive how the bass can do the injury that is charged to them, unless they should swarm in such countless numbers, like the menhaden and other pelagic rovers, as to fill the river basin from bottom to surface. The scarcity of shad is to be accounted for by the fact that his comings and goings are intermittent, just as are the movements of all anadromous fish to a certain extent. The present year is probably his year off; next year we shall see him in greater abundance.—Ed. F. & S.

Shad in the Sacramento River.—We have been favored by Prof. Baird with the following extract of a letter, dated April 18, from Mr. Horace D. Dunn, well known as an eminent discoverer and scientific observer on the West Coast. It most satisfactorily settles the question as to the introduction and maintenance of shad in the Sacramento River, as the result of their transfer from the Atlantic coast:

"The young shad are now becoming so numerous that many of the salmon fishermen complain that it gives them much trouble to replace them in the water when taken, as the law directs. The business of canning salmon has been recommenced on a large scale near the mouth of the Sacramento River, the first shipment of 180 cases having been received in San Francisco."

Canned Salmon.—All reports from the North Pacific coast show that the business of canning fish is constantly increasing, and bids fair to become far more important than at present. New "canneries," as the factories are termed, are springing up, and even the Chinese are going to Washington Territory and Oregon to engage in the business. There is so much put up, indeed, every year, that home consumption and the trade of the Eastern United States uses only about twenty per cent. of the annual crop. The remainder goes to Europe, the most of it being contracted for by English houses long before the fish are caught. This splendid result, and the cheering prospect of its infinite continuance, is no doubt due, almost entirely, to the wise restrictions which have been thrown around fishing in the Columbia. Perhaps no other river in the world has been protected by such an intelligent policy. If the Connecticut, or Hudson, or Delaware, or a dozen European streams had received a similar far-seeing protection, the toothsome fish might yet be common on all our tables. But in that case there would be little demand for Columbia River salmon. "It's an ill wind blows no one good."

Natural History.

The Clam Dissected.—At the last session of the Sumner School of Biology attached to the Peabody Academy of Science at Salem, Massachusetts, the first lecture was upon the common sea clam (*Mya arenaria*), its habits and anatomy, which were pleasingly illustrated by Prof. Morse in his usual enthusiastic manner. At the close of the lecture the class repaired to the laboratory, where they found a quantity of the bivalves to work upon. Each student being provided with scalpels, proceeded to open it by passing the scalpel between the valves and severing the adductors or powerful muscles which connect the valves. A valve was then removed, and the various organisms exposed. The heart continues to beat and its pulsations may be readily seen. The parts most readily seen are the sipons with their strong yoke of muscles, the gills or *branchiæ*, the palpi and the mouth; they then proceed to clip away portions of the mantle and to trace out the course of the alimentary canal, the nervous and muscular systems, and to make drawings as they proceed. After working upon bivalves a few days, gasteropods, insects, crustaceous starfishes, etc., are taken, and the student learns to compare the various organs in a few typical forms, thus obtaining the key to more extended investigations, which may then be carried on without the aid of a teacher. Two interesting lectures were given by Prof. Morse upon the Evolution theory, and the work of American students in its behalf.

The dredging parties and botanical excursions in the vicinity afforded many objects for study, and formed a pleasing feature of the session.

We are glad to hear that they propose to hold another session the coming summer at Salem. It will commence July 6th, and continue six weeks. Lectures will be given each Monday, Tuesday, Thursday, and Friday, at 9 A. M.; each Wednesday will be devoted to a dredging trip, the remaining time being given to laboratory work, demonstrations and excursions, making the course a practical one, that teachers may learn the methods of studying and teaching Natural History. During the coming session entomology, the study of spiders; crustacea, and the anatomy of vertebrates will receive special attention; the preparations in the museum will be used as illustrations.

Dr. A. S. Packard, Jr., assisted by Messrs. J. H. Emerton and J. S. Kingsley, will give instructions in zoology. Mr. John Robinson will lecture upon botany, and Rev. E. C. Bolles upon microscopy. The admission fee will be $15.00, or to lectures alone $5.00. Names of applicants should be sent in by May 1st. Information may be obtained of Dr. A. S. Packard, Jr., Salem, Mass.

The Audacity of Hawks.—Apropos of the experiences related in Mr. Frank Schley's book, "American Partridge and Pheasant Shooting," in which it is stated that the writer had often seen hawks dart upon and carry off birds he had killed before they had fallen to the ground, the Easton *Free Press* has the following:

"Mr. I. N. Mills, a veteran sportsman of Wilmington, Delaware, says he has seen some rather audacious things done by the pigeon hawk, but nothing to match Mr. Schley. He relates that 'while gunning some years ago near Principe's Furnace in Cecil County, Maryland, my setter dog came to a point in some bushes near a pine thicket. I was standing on the railroad embankment some ten or twelve feet above him at the time, and called up the party who was shooting with me. Before we could get to the dog a hawk darted out of the pines and took one bird out of the covey not three feet from the dog's nose. The look of astonishment that poor Dash gave as he turned his head to me when the covey rose from fright was so comical that I could not shoot either at the covey or hawk for laughing. Again, three years ago, while shooting in Tuckahoe Neck, Talbot County, Md., four of us in a party, with four dogs, were beating a large field near a magnolia swamp. One pointer came to a stand about forty rods off, and the other dogs drew up and backed him. While we were advancing, a large chicken hawk flew from the swamp and took a bird out of the covey, but I was too quick for him, and stung him so sharp that he had to drop it. The No. 10 shot I had in was not sufficient to kill at the distance. The quail was not much hurt, as it got out of the way fast enough. In neither of these cases had a gun been fired until after the attack had been made.'"

The Silk-Spinning Fish.—There is a mollusk—the *pinna* of the Mediterranean—which has the curious power of spinning a viscid silk, which is made in Sicily into a textile fabric. The operation of the mollusk is rather like the work of a wire-drawer, the substance being first cast in a mould formed by a sort of slit in the tongue, and then drawn out as may be required. The mechanism is exceedingly curious. A considerable number of the bivalves possess what is called a *byssus*, that is, a bundle of more or less delicate filaments, issuing from the base of the foot, and by means of which the animal fixes itself to foreign bodies. It employs the foot to guide the filaments to the proper place and to glue them there; and it can reproduce them when cut away. The extremity of the thread is attached by means of its adhesive quality to some stone; and this done, the *pinna*, receding, draws out the thread through the perforation of the extensile member. The material when gathered is washed in soap and water, dried, straightened, and carded; one lb. of coarse filament yielding about three ozs. of fine thread, which, when made into a web, is of burnished golden-brown color. A large manufactory for this material exists in Palermo.—*Scientific American.*

Moles and Their Worm-stores.—In a tract of meadow land in Norfolk, which lies below the level of a tidal river, and which is therefore preserved from being submerged by artificial embankments, the mole is not infrequent, although he is regarded by the occupiers with great disfavor. In addition to his ordinary sin of making the grass-land difficult to mow, he has an ugly trick of boring into the river walls; and, by loosening the sods which hold these walls together, imperils the walls themselves. Mole-catchers are therefore in great request, and a few minutes spent in company with one have taught me a lesson on the mole's history which was quite new to me. March is the mole's breeding month; and, in preparation for the appearance of young ones, stores of fresh meat, in the shape of worms, have been laid up under hills, larger than the ordinary mole-hills, but in the open marsh, which an experienced eye readily recognizes. The mole catcher (in whose company I found myself accidentally) is employed to poison moles, and the food in which he puts his poison is the common earth worm. Sooner than spend his time in digging for these on the upland, he had come down to the marsh to rob the mole's larders, and he hit on these with the sagacity of a terrier sniffing at a rabbit's burrow, and did not open a hill in vain when I was with him. He chose the largest hil s which were on the highest spots on the marsh, and opening one in my presence, he laid bare a round cavity, the sides of which were beaten hard by the mole, so as to prevent the worms from attempting to pierce their way out. Inside this there was nearly a quart of fine worms, quite free from any admixture of soil, each worm apparently tied up in a coil or knot, yet all alive. Upon being dragged out of the place in which they had been stored, the worms began to wriggle away; but the mole-catcher put them into the box he carried, and took away his prize. Is this habit of the mole generally known among naturalists? It seems to argue a reflective faculty, great as in the beaver, that the mole should prepare a prison in which worms can be kept alive.—*Field.*

Destruction of Our Birds.—Mr. H. D. Minot, of No. 4 Garden Street, Cambridge, Mass., is writing a paper in which he wishes to present some figures about the annual destruction of our birds, particularly the game birds. He asks for any trustworthy estimates, facts, or references to articles in periodicals applying to the subject, and we gladly refer him to our readers for assistance in his investigations.

Migration of Kingbirds.—I saw on May 1st a very remarkable flight of kingbirds (*Tyrannus carolinensis*). When first observed they were flying high in the air, and at first I mistook them for robins. I estimated the flock to contain at least two hundred; they were flying in a wavering and uncertain manner, coming from the southeast. When directly overhead a pair of the same kind of birds (that had established themselves in my orchard for a week) set up a lively *screeching*, and the flock, after flying around sometime, settled in the trees. I have never heard of them coming in flocks before, and have never seen more than a pair at a time. I have not seen a scarlet tanager this spring. They usually arrive here about the 23d of April. Guyon.

SOUTHERN NOTES.

Randolph Macon College, Va., April 18, 1877.

Editor Forest and Stream.

Seeing something in your paper about the breeding of tamed wild geese, I would like to add a little to what has already been said in Forest and Stream. Two years ago, in Onancock, Accomac County, Va., a gentleman owned a flock of Canada geese. Two pairs of these bred every spring. The others, since they do not breed in captivity until they are three years old, were too young to breed. I myself have seen the old birds sitting on their eggs. Another gentleman in Onancock owned three pairs of this species that had not bred when I last heard from them, though they made their nest. This gentleman used his geese as decoys. He used to tie them by their legs with long cords to a stake, driven down into the sand of some sand-bar making out into the bay. He gave them cord enough to allow them to swim in the bay, or to walk on the sand as they chose. At convenient range from the geese was a blind, where the gunners lay concealed. The tamed geese would soon honk up some of their wild brethren if any were about.

I have been observing the arrivals of the birds that come from the South in spring. On April 6th I saw the first brown trush (*Harporhynchus rufus*). He sang feebly the first day, but has improved every day since, until now he is unrivalled by any bird about here. On April 12th I saw two or three goldfinches, or yellow birds, putting on their summer garb. They were not in full plumage, but seemed to be just half-way between their winter and their summer dress. This morning, very early, I heard the first whip-poor-will (*Anrostomus vociferus*). He did not whip-poor-will as fast nor as lively as he will in a week or two. He just seemed to want to let us know that he had come from his winter home to enliven our twilight hours. I also saw to-day, for the first time this season, a poor, lone, chimney-swallow. He looked lost. While speaking of the events of to-day, let me mention that I saw to-day the first bald eagle that I have ever seen at this place. It was a young bird and was traveling. Though this eagle is very rare here, it is very common on the Eastern Shore. Last January I found the nest of a pair of white-headed eagles in Gloucester County. They were sitting. I did not disturb them. I read your paper with much interest.

Jesse T. Littleton.

DOES THE OSPREY EVER TAKE DEAD FISH?

Pottsville, Pa., April 2, 1877.

Editor Forest and Stream.

I have read with great interest "Roamer's" valuable article on the habits of the osprey, as well as several other notes which you have published on this interesting subject. In answer to "Roamer's" query in regard to the incident narrated by me, and which appeared in your valuable journal of February 8th, I would say that the fish showed marks of the talons of the hawk, and that when it fell into the water it came to the surface, and while struggling around in a circle the bird made his second plunge, taking the *same* fish. The fish, I should say, exhibited no shot marks. Dom Pedro.

THE FAUNA OF MICHIGAN.

By Archer.

(Continued).

CLASS AVES.

ORDER RAPTORES.—FAMILY STRIGIDÆ.

Genus *Strix*.

Strix pratincola. Bonap. American barn owl. Seldom seen except in the counties of the southern tier.

Genus *Otus*.

Otus wilsonianus. Less. Lesser horned owl; long eared owl.

Otus brachyotus. Steph. Marsh owl; short eared owl.

Genus *Syrnium*.

Syrnium cinereum. Aud. Great grey owl. Is a rare visitant to the Lower Peninsula.

Syrnium nebulosum. Gray. Hoot owl; barred owl.

Genus *Nyctale*.

Nyctale richardsonii. Bonap. Richardson's owl. Confined to Upper Peninsula.

Nyctale acadica. Bonap. Sawwhet owl; white fronted owl.

Genus *Scops*.

Scops asio. Bonap. Screech owl; mottled owl.

Genus *Bubo*.

Bubo virginianus. Bonap. Great horned owl.

var. *Arcticus.* Swain. Arctic owl.

Nyctea arctica. Gray. Snowy owl. Very common.

Genus *Surnia*.

Surnia hudsonia. Gmel. American hawk owl.

FAMILY FALCONIDAE.

Genus *Falco*.

Falco (Hierofalco) candicans. Gmel. White gerfalcon. A single specimen only has been taken within the limits of the State, so far as known by me.

Falco (Hierofalco) labradora. Aud. Black gerfalcon. Have never seen one. I give both this and the preceding on the authority of the late Dr. G. B. Wilson, F. S. S.

Falco communis. Gmel. Duck hawk. American peregrine falcon.

Falco (Æsalon) lithofalco. Gmel. Pigeon hawk; American merlin.

Falco (Tinnunculus) sparverius. Linn. Sparrow hawk; American kestrel.

Genus *Pandion*.

Pandion carolinensis. Gmel. Fish hawk; American osprey:

Genus *Nanclerus*.

Nauclerus forficatus. Ridg. Fork-tailed kito. Not common. Sometimes breeds in Southwest Michigan.

Genus *Elanus*.

Elanus leucurus. Vieil. White-tailed kite. *Accidental.*

Genus *Ictinia*.

Ictinia mississippiensis. Wils. Blue kite. *Rare.*

Genus *Circus*.

Circus hudsonius. Linn. Marsh hawk.

Genus *Nisus*.

Nisus fuscus. Keup. Sharp-shinned hawk.

Nisus cooperi. Bonap. Cooper's hawk.

Genus *Astur*.

Astur atricapillus. Wils. American goss hawk.

Genus *Buteo*.

Buteo pennsylvanicus. Wils. Broad winged hawk.

Buteo swainsoni. Bonp. Baird's hawk. Swainson's hawk. This is a rare bird. A specimen killed in Genesee County is now in the museum of the Flint Scientific Association.

Buteo lineatus. Gmel. Red-shouldered hawk.

Buteo borealis. Gmel. Red tailed hawk.

Genus *Archibuteo*.

Archibuteo logopus. Penn. Rough-legged hawk. Not common.

Archibuteo sancti johannis. Gmel. Black hawk. Rare.

Genus *Aquila*.

Aquila canadensis. Linn. Golden eagle.

Genus *Haliætus*.

Haliætus leucocephalus. Linn. Bald eagle. American eagle. In the Geological survey of Michigan for 1860, Dr. Miles gives *Haliæus Washingtonii*. Aud. Washington eagle. For my part I know of no such species, I have always supposed *H. leucocephalus* and *H. Washingtoni* the same. Will some one enlighten me upon this subject?

FAMILY CATHARTIDÆ.

Genus *Rhinogryphus*.

Rhinogryphus aura. Linn. Red-headed vulture. Turkey buzzard.

Genus *Catharista*.

Catharista atrata. Bart. Carrion crow. Black vulture. Specimen captured near Monroe, Michigan.

BIRDS OF THE COTEAU DES PRAIRIES OF EASTERN DAKOTA.

By Charles E. M'Chesney, M. D., U. S. A.

(Continued.)

Zenaidura carolinensis. Carolina Dove. Arrives May 17th, and remains until September 30th. Is found in considerable numbers.

Pediœcetes phasianellus Var. *Columbianus.* Common sharp tailed grouse. Resides here throughout the entire year. Is at no time numerous.

Cupidonia cupido. Pinnated grouse. This bird is just making its appearance in this section. It remains throughout the year. Is not numerous.

Squatarola helvetica. Black-bellied plover. I have not seen this bird here during the spring migrations. It appears during the Southern flight about October 26th, and departs November 1st. Is seen in considerable numbers.

Charadrius fulvus, Var. *virginicus.* American golden plover. Is found here occasionally during the spring and summer months, but occurs in considerable numbers from September 23d to October 26th.

Ægialitis vocifera. Killdeer plover. Arrives April 13th and remains until September 1st, and is during this time found in large numbers; breeds here.

Strepsilas interpres. Turnstone. During the spring migrations of 1876 I observed six or seven turnstones on two or three different occasions (May 26th to 29th). This is as yet, I believe, the only record of their occurrence in Dakota.

Recurvirostra americana. Avocet. Arrives May 4th and is found in small numbers until October 30th. I believe, however, it breeds a little further north, possibly leaving this vicinity during June and July.

Steganopus wilsoni. Wilson's phalarope. Is found here from May 17th until July 24th, when it departs southward. Is seen in large numbers and breeds here.

Gallinago wilsoni. American snipe. Wilson's snipe is seen here only during the spring migrations (May 1st to 6th), and then only in small numbers.

Macrorhamphus griseus. Red-breasted snipe. Occurs here in considerable numbers from September 20th to October 30th.

Ereunetes pusillus. Semi-palmated sandpiper. Is seen here in very large numbers from April 20th until June 13th, when it disappears, none being seen until July 3d, from which date to November 1st hundreds can be seen at a time around the shores of any of the lakes.

Tringa minutilla. Least sandpiper. Shares much the same habits here as the preceding. This species certainly breeds here. Is very abundant.

Tringa Bairdii. Baird's sandpiper. This sandpiper appears April 28th and remains until June 13th, after which date none are seen. During the time of its sojourn here, however, it is quite numerous. Its habits seem to differ greatly from its near relatives.

Tringa maculata. Pectoral sandpiper. Is found here from July 13th to August 1st, in considerable numbers.

Tringa fuscicollis. White-rumped sandpiper. Arrives May 5th and departs June 13th. Is seen during this time in considerable numbers; seems to share many of the habits of its little congenitor, *T. Bairdii.*

Limosa fedoa. Great marbled Godwit. Is found here in great numbers from June 14th until September 23d, with stragglers as late as the middle of October. This bird breeds in great numbers, just off the Coteau to the east, in Minnesota.

Totanus semipalmatus. Willet. This bird arrives April 29th and remains until September 13th, in considerable numbers; breeds here. It seems to feed to some extent on fish and its flesh; is not particularly desirable as food.

Totanus flavipes. Lesser tell-tale. This bird arrives July 13th and remains until October 28th. At first seen in small numbers, but as fall comes on its numbers increase greatly.

Tringoides macularius. Spotted sandpiper. Is found here in limited numbers from June 21st to September 8th.

Actiturus bartramius, Bartramian sandpiper. The upland plover is very abundant here from May 10th until August 20th. Breeds all over the prairie in great numbers.

Tryngites rufescens. Buff-breasted sandpiper. This strange sandpiper is seen here a few times each year. On May 22d, 1876, while out hunting on the open prairie, a flock of twenty or thirty passed near me, from which one was secured. Two or three others were taken on as many different occasions.

Nyctiardea grisea, Var. *navia.* American night heron. Is seen here in considerable numbers from August 10th until October 25th.

(To be Continued.)

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN FOR WEEK ENDING MAY 8, 1877.—Eight summer ducks (*Aix sponsa*), purchased; one Macaque monkey (*Macacus cynomolgus*), pre-sented; six red foxes (*Vulpes fulvus*), presented; one monkey (*Macacus nemestrinus*), born in Garden; one black snake (*Bascanion constrictor*), presented.

ARTHUR E. BROWN, Gen'l. Supt.

Woodland, Farm and Garden.

ANNUALS.—Now is the time to sow annuals ere the hot weather sets in and burns up the young seedlings before they get proper roothold. None, perhaps, gives more satisfaction than phlox drummondii in its various colors, showy and useful for cuttings; petunias also are very ornamental if of good sorts, flowering away into the late fall months; asters and zinnias are excellent; marigolds, both French and African, should have a place with marvel of Peru and balsams, toward the back of the borders, while mignonette, portulaca, in its many bright colors, candy tuft, sweet alyssum, etc., that do not grow so tall, will do duty and flower well all summer, more toward the front of the borders. Larkspurs, snapdragons, dwarf convolvulus and many other sorts are all worthy of a place, while a few dollars judiciously expended on gladiola, zonal geraniums, monthly roses, lemon verbenas, and such plants will keep not only the garden but the parlor vases beautiful all the season.

MAGNOLIA HALLEANA.—This beautiful hardy magnolia was introduced from Japan nearly twenty years ago, but still continues to be but little known, indeed hardly recognized in the country at large. The cause is principally in the difficulty of its propagation, though all who have seen it are delighted with its beauties. The first impression made is of intense individuality. It rounds out and matures into a complete bush of symmetrical form and solid wood, and is a true member of the shrubby type of magnolias. The same excellence appears also in the unrivalled beauty and earliness of its flowers. These somewhat resemble the water lily in the translucent whiteness of the narrow petals, and they surpass all others in their delicate and subtle odor. The leaves are of a rich green color, neither large nor small, and are in agreeable keeping with its general habit, while the effect produced is that of a noble and exquisite plant. D.

THE JAPAN JUDAS TREE.—This most beautiful tree, mentioned a week or two ago in our pages, is now in full bloom in Central and Prospect Parks, and its lovely purplish pink blossoms, clustered as they are so thickly on the stems, quite throw our native variety into the shade. It has also the advantage of blooming at least a week earlier than the latter, and at the same time is much brighter in color, perfectly hardy, and a lovely match for the golden forsythia, the white spirea thunbergii, or the deep scarlet cydonia japonica.

THE JAPANESE PERSIMMON AGAIN.—W. W. Hollister writes date of 14th March, 1877, from Santa Barbara, to Rev. Henry Loomis (who has been for some time this season at Mr. Trumbull's seed store, Sansome street, San Francisco, Cal., selling a great number of grafted trees of this valuable fruit) as follows:

"Seven or eight years ago I purchased of a Mr. Van Reid, of San Francisco, half-a-dozen Japanese persimmon trees in pots or boxes. Two of them lived, but for four years, from neglect or want of proper care, did not do well; or perhaps being kept too long in the boxes in which they were received. After being put in better position they gradually recovered, and for two years have done well. I can scarcely express my surprise upon seeing the magnificent fruit of the last year, when the trees had proper care. The fruit is, I think, the most beautiful of all the fruit I have ever seen, and it is most delicious to the taste. You can judge of what an improvement it is upon the old species of persimmon of the States, when I tell you that I carried four of them to San Francisco last fall, which weighed three-quarters of a pound each. This variety is seedless, and can of course only be propagated by budding or grafting. The fruit is of a rich golden color, a little deeper, approximating toward a red, and seems more like a ball of wax than a fruit. It is simply splendid. I understand you are introducing this fruit and other varieties of the persimmon into this State from Japan. May good luck attend you. You can do no better thing for California. I think it will be the greatest acquisition to our State in the way of fruit ever introduced."

Another communication concerning this fruit is from J. Grey Jewell, M. D., late U. S. Consul at Singapore, dated 21st March, 1877, to the Rev. Henry Loomis, and is as follows: "In reply to yours of yesterday I have much pleasure in saying, that as regards the Japanese persimmon, so called, I have very pleasant recollections. During my residence in the East Indies, as U. S. Consul at Singapore, it was my good fortune to have the opportunity of frequently partaking of it. It came to us from China, packed in plaster of Paris, to prevent the hot climate of the tropics from affecting it. There are generally two kinds or shapes—the round and the oval, or egg-shaped. Both have about the same flavor, and in size compare favorably with a medium-sized American apple. Those which came to us were apparently seedless. The seeds and core appeared to be absorbed, at least so that we could take the pulp from the rind with a spoon, and to our taste it was delicious—not at all arid, like the American persimmon. It is, as I have met in China and India, when properly cultivated, an excellent fruit, and I believe it can be raised here and soon become a great favorite and a very acceptable addition to American fruits."

HINT TO PEACH GROWERS.—The following is sent to us by Mr. Oscar Speitzer of San Francisco, and is worth careful attention:

"A simple method of increasing the size and inducing the earlier ripening of peaches is given by Mr. Riviere in a pamphlet, in which he describes a method practiced by M. Chevalier of Montreal for producing these effects. The method consists in making a slit in the flowering shoot from below upward in March (i. e., beginning of spring). The slit in question extends half way through the shoot, and is an inch in length, so that the operation is exactly like that of layering pinks. The theory of the success of the operation is that the downward current of nutritive sap being thus forcibly arrested, the fruits above the mound are proportionately increased in size as they would be after ringing."

MATE OR PARAGUAY TEA.—Among the novelties presented at the Centennial Exposition at Philadelphia was the Maté, a decoction of the leaves of the Maté tree (*Ilex paraguayensis*). This tree grows wild in the forests of Brazil and the Argentine Republic, especially upon the various tributaries of the Parana and Uruguay; it is also found in the valleys of streams whose waters join the Paraguay to the northeast. The tree sometimes approaches medium-sized apple trees in height, but the leaves are gathered mostly from smaller shrub-like plants. It is stripped of its leaves and branches almost every other year. Several varieties of this tree are mentioned, especially two, the mild or choice, and the strong. At the Exposition a pamphlet in Portuguese, French, English and German, written by Dr. Antonio Joaquin de Macedo Soares, presents the claims of the province of Parana, which exports mostly through the ports of Paranagua and Antonia. The exports of the fiscal year ending June 30, 1870, amounted to 31,777,408 pounds, and rose the following year to 36,073,713 pounds. The home consumption in Parana is almost 9,000,000 pounds per annum, and in Rio Grande do Sol nearly four times as much, not including large quantities consumed by natives without having been marketed. An arroba (32.39 lb.) is estimated as sufficient for the consumption of a single individual about six months, if taken three times per day, and this would cost about four dollars per annum, whereas an equivalent of coffee or of black or green tea would cost much more. It is claimed that the Maté beverage is very nourishing. It is prepared either from the powder of dried leaves pulverized, or from the leaves themselves by infusion. It needs intelligent experiment and observation to develop the real qualities of the plant, but it has become the favorite beverage of a large portion of the people of South America. It is less exciting than either tea or coffee, as it contains less of essential oil, while its larger proportion of resin makes it a better diuretic than coffee, though it is less rich in this element than either green or black tea. It has a pleasant aroma, and when taken with milk and sugar it is a good substitute for either tea or coffee. It slightly stimulates the nervous system, but not to the point of sleeplessness. It contains as much theine as tea, and double the quantity found in the same weight of coffee grains. It is sold in Rio Janeiro at about ten cents per pound.—*Report of the American Department of Agriculture.*

PRESERVING TIMBER.—The improvements in saturating wood and timber, invented by Mr. H. Sainsbury, of Paris, consist in employing a solution formed in the relative approximate proportions of water, 1,000 litres; alum, 16 kilos.; sulphate of copper, 16 kilos.; bromide of sodium, 1 kil.; and iodide of sodium, 1 kil. For the purpose of the invention he prefers placing the timber or wood to be treated in a close vessel, from which he draws off all the air, and in which he immediately injects the above-mentioned liquid with a pressure varying from 15 pounds to 150 pounds to the inch. It is stated that wood thus injected not only acquires thereby a considerable degree of hardness, whereby it is better fitted to resist wear and tear, friction, exposure to the atmosphere and deteriorating causes, but it is also rendered completely incombustible.—*Builder.*

THE VERBENA DISEASE.

EDITOR FOREST AND STREAM.

I have just seen the article on the Verbena disease in last number, and make out from it that your correspondent is yet undecided whether or not an insect has anything to do with the matter. If you will run over some day I will show you the "varmints" crawling about as lively as crickets on plants that are affected by rust, while you may look your eyes out in the endeavor to see them on healthy subjects. Why it should ever be questioned by any one having opportunity to see, is a quandary to me. P. H.

Jas. L. R. Cincinnati, O.—The Japan Judas tree was sent out by Parsons & Co., Flushing, some years ago, and we think can be had of any nurseryman who keeps posted in really good novelties. The *Encomis punctata* is an old, much neglected plant, rarely seen except in old collections.

G. T. Howard, Pa.—We mail to-day schedule of N. Z. Horticultural Society. See special premium offered for November next.

ANALYSIS OF THE ONION by Messrs. Wellington and Bragg, under the direction of Professor Goessmann at the Massachusetts Agricultural College chemical laboratory, being the first authentic analysis of this plant on record. 1000 parts, air dry, contain:

Water	892.660	Lime	0.354
Organic matter	104.538	Magnesia	0.139
Nitrogen	2.120	Iron (Fe_2O_3)	0.027

Potash	1.689	Sulphuric acid	1.151
Soda	0.083	Silica	0.145

—*Scientific Farmer.*

RAINFALL AT SANTIAGO.—A register was kept at Santiago from 1824 to 1850 to record the number of minutes and hours during which rain fell throughout the twenty-seven years, and the average of a year's fall was 215½ hours or nine days. Seven-ninths of this fell in the four months of May, June, July and August, while in the whole five months of November, December, January, February and March rain fell only for seven hours and a half. The whole twenty-seven Januarys would only have given fourteen hours' rain had there not been an unexampled fall of forty hours during the January of 1837. June and July, by far the wettest months, only gave four and a quarter days' rain between them.—*"Over the Sea and Far Away."*

Rational Pastimes.

THE GAME OF POLO.—*Rules of the California Polo Club.*—1. The goals shall be two hundred yards apart, or according to the number of runs to be made.

2. The ball shall be three and one-half inches in diameter; the sticks not to exceed three and one-half feet in length.

3. Sticks may be hooked and taken from an opponent, but no stick can be hooked either under or in front of a horse.

4. Any player catching an opponent's arm or horse, or holding his stick in front of an opponent's horse, in order to prevent the horse's advance, or hitting an opponent's horse to drive him over the ball, shall be declared out of the game.

5. If it can be shown to the umpire that a run has been made by a foul, it shall be the duty of the umpire to declare it a dead run.

6 Two decisions of foul runs shall score one run against the offending side.

7. In case a ball is hit beyond the goal but outside the flags, the ball shall be put on the line through which it should have passed, and both sides drawn up behind the goal, the party defending the goal shall be entitled to a hit-off.

8 In case the ball passes outside the side limits, the ball shall be placed in the centre of the course opposite where it left the course, with each party on their respective sides facing the ball, and shall be started by the umpire.

9. The game shall be started by the umpire, either by word or dropping the flag. The opposing parties to face each other thirty yards from the ball, the two starters to step to the front of their respective sides, and to advance at the signal.

10. Any party losing his stick must either dismount to recover or pick it up from his horse. Any party receiving his stick either from a fellow player or from a spectator, shall have a foul scored against him, or by an order from the umpire shall throw his stick to the ground and recover it himself.

SMILER'S HEALTH LIFT.—Dr. Smiler, says Max Adeler, had a large tank placed on the top of his house from which to supply his bathroom and so forth with water. The water had to be pumped up about fifty feet from the cistern in the yard, and the doctor found it to be a pretty good-sized job, which would cause him constant expense. So after thinking the matter over very carefully, one day an idea struck him. He built a room over the cistern and put word "Sanitarium" over the door. Then he concealed the pump machinery beneath the floor, and he rigged up a kind of complicated apparatus with handles and hinges and a crank, so that a man by standing in the middle of the machine and pulling the handle up and down would operate that pump.

Then the doctor got out circulars and published advertisments about "Smiler's Patent Health Lift," and he secured testimonials from a thousand or so people who agreed that the health lift was the only hope for the physical salvation of the human race. Pretty soon people began to see about it, and Smiler would rush them out to the "Sanitarium" and set them to jerking the handles. And when a customer had pumped up fifty gallons or so, Smiler would charge him a quarter, and tell him that three months of that kind of thing would give him muscles like a prize-fighter.

The thing became so popular that he had to enlarge his tank and put in a smaller pump; and he not only got all his pumping done for nothing, but the people who did it paid him about $1,500 a year for the privilege.

One day, however, Mr. Maginnis, who had been practising at the health lift every day for months, broke the board upon which he was standing, and plunged into the cistern, and just as he was sinking for the third time Smiler fished him out with a crooked nail in the end of a clothes prop.

A few days later Maginnis came round with a lot of other patients, and cross-examined Smiler's servant girl, and learned about the truth, and then they went home mad. A consultation was held, at which they resolved to prosecute Smiler for damages and for obtaining money under false pretences. It is thought by good judges that by the time the court gets through with Smiler, it will be about the unhealthiest lift for him he was ever interested in.—*Scientific American.*

Rifle.

CREEDMOOR.—There was a time in the history of Creedmoor when the mere mention that Col. Bodine or Maj. Fulton were to shoot in a long range match was sufficient to destroy all hope of victory on the part of the new comers, but grit and persistence are characteristics of our American riflemen. The youngsters kept on "banging away," but with system and judgment, noting with care whatever of valuable advice dropped from the old reliables, until on Saturday it was shown that some folks are as good as some others, if not a great deal better, and the boys walked away up among the "possibles," leaving their elders doing very fair mediocre work far down below them. Ostensibly it was a match fought under the International match rules between teams of six from Brooklyn and New York respectively, captained by Maj. H. S. Jewell on the part of the cross-river men and Col. Gildersleeve on the part of the Metropolitans, but really it was a Senior vs. a Junior team contest. Among the veterans were Gildersleeve, Bodine, Fulton, Bruce, Coleman and Sanford. The younger generation of shooters included Allen, Bladenburgh, Rathbone, Weber, Jewell, with Gen. Dakin as heavy end man. When the match was first proposed on April 1st last, opinion was in favor of the New Yorkers. But the Brooklyn boys went to work with a will, drilled and organized, and for weeks past have been again and again on the field putting themselves in trim, and the result justified the importance which has been placed upon method and team practice in contests of this sort. The day was fair, though toward the close the wind became shifty, but from the word "go" it was a clean walk away for the lads. At the close of the very first round they were nine points ahead, and from that on it was a stern chase for the New Yorkers. In the list of scores it will be noted that the poorest Brooklyn score, that of Gen. Dakin, is still in advance of the best New York score. Col. Gildersleeve was indeed suffering from a swollen eye, but otherwise the New York scores are what might be expected of fresh spring marksmen. The Brooklyn record, on the other hand, is exceptionally good, and would do credit if made on one of those calm fall days when a summer's drill has brought hand and eye and brain into harmonious action.

Compared with previous long range team shooting, the work of the Brooklyn shooters is very fine indeed. In the Irish American match of last fall the totals were 1154 and 1165 respectively, and taking the six *best* scores on the first day's shooting for the International trophy, the totals show America, 1196, Ireland and Scotland, 1202 each. On no other occasion do we remember anything passing Saturday's score of 1186, and the others were fall scores after a season's drill. The match shows that while the "old guns" may step down and out, we have a group of experts ready to take their places and even push them to the wall by making superior scores. There need be little fear that when again called upon to defend and retain the International prize our men will be ready to score another victory.

The full scores in the Brooklyn vs. New York match are:

BROOKLYN TEAM.

Name.	800 yds.	900 yds.	1,000 yds.	Total.
C. E. Blydenburg	72	70	60	202
H. S. Jewell	69	72	58	199
L. L. Allen	71	67	60	198
L. Weber	68	67	62	197
R. Rathbone	72	65	59	196
Gen. T. S. Dakin	70	65	59	194
Total				1,186

NEW YORK TEAM.

R. C. Coleman	70	63	59	192
Col. John Bodine	74	60	57	190
Capt. L. C. Bruce	65	61	56	184
Lieut. Col. E. H. Sanford	65	66	53	184
Major H. Fulton	63	66	48	177
Col. H. A. Gildersleeve	52	63	52	167
Total				1,094

RIFLE NOTES.

C. E. Blydenburgh made the first score of 200 points at the long ranges this season.

The "running deer" target is quite a favorite.

The members of the American team which was victorious over the Canadians in the Canadian International Match of 1875 are to receive gold badges to commemorate that event in a few days. They were W. B. Farwell, L. L. Hepburn, H. S. Jewell, L. Geiger, J. S. Conlin, L. C. Bruce, F. Hyde and A. V. Canfield.

Creedmoor looks better than ever. The range is in excellent condition, and the greenest of grass, dotted with field flowers, gives it a very pleasing aspect. H. S. Jewell has changed his position. It's an original one.

CONLIN'S GALLERY.—Last Saturday evening, May 12th, a number of the amateur "gallery" shots in this city met and competed for the amateur badges at Conlin's Gallery, 1222 Broadway.

The interest in these weekly competitions keeps still unabated, and there is no small amount of strife for the supremacy among the competitors, there being 26 of them in number in the last contest. A change has been made in the conditions which allows each competitor to two entries, his high score to count.

The following are some of the best scores made during the evening in the competition (3d): P. Fenning, 48; M. L. Riggs, 48; Leon Backer, 47; M. B. Engel, 47; L. C. Bruce, 47; Thos. Wildes, M. D., 47; Fred Alder, 46; C. Von Gerichten, 46; N. B. Thurston, 45; B. Zettler, 44; J. Honig; 44; M. F. Cahill, 44; R. Duff, 43; M. DeMott, 41; Judge Smith, 41; Wm. Klein, 41; A. F. Newkirk, 40. Seventeen contestants averaging centers or better.

In the old gallery of 930 Broadway the targets used in matches were reduced Wimbledon, 200 yds., while at the present place the ones brought into use are Creedmoor, 200 yds. reduced, which are larger, giving a marksman a better chance for making higher scores than when using the Wimbledon, which accounts in a measure for the increased number of 47 and 48 made at the gallery.

Hereafter Mr. Conlin desires to announce that the competitions for the amateur badges will take place every Thursday evening till finally won.

MASSACHUSETTS.—We have received a copy of the by-laws of the Walpole Amateur Rifle Club of Walpole, Mass. They have fitted up anew their range with two first-class iron targets, after the Creedmoor style of pits, etc., and everything is in good working order for 200, 500, 600, 800, 900, and 1,000 yards, shooting. This is the original rifle club of this State, it being their fourth season at short range and third year at long range. They are now preparing for a long range match with the Massachusetts Rifle Association, to take place the 30th of May.

—The Lawrence (Massachusetts) Rifle Club had a practice shoot at Merrimack Range, Saturday afternoon. Weather fine, but wind too changeable for high scores. Out of a possible 75 at 500 yards the leading scores were: R. F. Sargent, 72; A. Richmond, 69; O. M. Jewell, 67; C. L. Austin, 67; H. F. Lord, 62; A. R. Derby, 59.

GEORGIA.—A match was shot in Bryan County, Georgia, on the 2d inst., between teams of local riflemen. The guns used are Remington, Sharpe, and Springfield rifles, distance 200 yards, seven shots each. The following scores were made:

WISCONSIN.—Milwaukee Rifle Club practice on May 11th, 1877, at their range at Wauwatosa on Soldier's Home Grounds, shooting across the Menominee valley. At the 900 yard range the execution was scored as follows: Bangs, 32; Turner, 40; Wellcs, 40; Fielding, 36; Yale, 27; Meunier, 37; Hill, 45; Drake, 39. Practice at the 1,000 yard range—possible 25—also resulted in very creditable scores in view of the unfavorable weather. The tally was: Fielding, 15; Turner, 18; Johnson, 18; Bangs, 18; Yale, 12; Hill, 16; Meunier, 18.

HOUSTON, TEXAS, April 27, 1877.

EDITOR FOREST AND STREAM.

I wish you could prevail on some of those correspondents of yours, who have been choke-boring us one week and cylinder-boring us the next, to relinquish their pet theories for a minute, and turn their attention to what I consider a matter of more importance. Down here we want some light on the subject of target rifles, more especially on the so-called Creedmoor long range rifle. And, by the way, this name seems to be applied to all rifles capable of hitting a target (when properly pointed) at 1,000 yards. At the present time, when rifle clubs are springing up everywhere, amateurs who have not an opportunity of consulting experts find themselves at infinite loss in selecting a proper weapon. Among the numerous long range rifles at present on the market, and all claiming to be the best, one cannot help suspecting that some at least are got up with a more immediate view to sale than good target practice. At any rate, I do not think that a little gentle criticism could do the manufacturers any harm—it might stimulate them to renewed exertions; and by furnishing purchasers with the means of judging a good gun, you will do the world a service by running worthless competitors out of the market.

I do not wish to disparage our choke-boring and cylinder-boring friends; on the contrary, they are just the men we should like to hear from; their general knowledge of firearms is so good that their opinions on this particular point could not fail to be of value, and they might help many in the selection of a rifle who cannot afford to buy their knowledge in the school of experience. I am not opposed to choke-boring myself, and have, indeed, an invention of my own in this line. I meant to keep it a secret, but for the benefit of science I let it go, and for the edification of your readers I shall try to describe it, as it obtains very considerable favor among the knights of the trigger down our way. Mine is what may be called an extreme choke-bore. We will take a champagne bottle as a simple example, it being wider at one end than the other—you see? Incredulous as it may appear, we use a liquid ammunition, and when the piece has got the proper elevation and a sufficient charge, it never fails to kill anything anywhere; and so far from alarming the game, it exerts an attraction on them which very few can resist. With this weapon we challenge all comers, men from Missouri not excepted. And forgive me for adding that the man at least, if not the gun, has a positive side-action—first one side and then the other. I now conclude this scrawl, which may prove, perhaps, that I am not a practiced letter-writer, but I hope at least I have made my wishes clearer than those of a brother sportsman who wanted an axe to "saw" a barrel to make a "hen-coop" for his "dog." WHYTE.

RECEPTION.—The last grand military reception and dress parade review of the Twenty-second Regiment was held at the armory on the 8th inst. The Mayor and other city officials were present, and Gilmore's immense band furnished some delightful music.

TO OUR SUBSCRIBERS.—The consolidation of the two papers brings us such a largely increased circulation, and so materially adds to the business of the office, that we are forced to defer increasing our paper to twenty-four pages, as contemplated, until we can make such arrangements regarding the mechanical portion of it as are necessary. Many correspondents whose communications have not yet appeared will please bear that fact in mind.

—It is believed that turkeys were introduced into England from America by William Strickland, lieutenant to Sebastian Cabot, in the time of Henry VII. Franklin always said the wild turkey should have been the emblem of the United States, the log cabins of the pioneers of his day being surrounded by these birds, who saluted each other from the boughs of the forest trees. Now no wild turkeys are found east of Pennsylvania, and in that State they are confined to the mountainous regions, and are few and far between.

Game Bag and Gun.

MAY IS A CLOSE MONTH FOR GAME.

NEW JERSEY.—A pigeon match between two sides, represented by banking clerks and brokers, took place yesterday on the Hackensack flats, near Snake Hill. They shot at five birds each at twenty-one yards rise. The clerks won by the following score: Clerks—Stebbings, 5; Jones, 5; Whitmore, 2; Walbert. 4Total 16. Brokers—Ogden, 5; Kemp, 4; Bratwell, 4; Wall, 0. Total 13.

—A correspondent writing from Charlotte, N. C., after complimenting our appearance, says:

"A sportsmen's club has just been organized here, which we call the 'Charlotte Rod and Gun Club'. We want to protect our birds and fishes, and see that the laws recently made by our Legislature for that purpose are enforced. For many years past there have been thousands of quail shipped north from this section of the State every season; but our Legislature has passed a law prohibiting their exportation, and we hope to see the iniquitous practice stopped."

—The Nashville *Rural Sun* proposes to open a Dog and Gun department.

THE GUN TAX.

ALBANY, April 30, 1877.

EDITOR FOREST AND STREAM.

"Venator," in his answer to my article on taxing guns, states that a tax on dogs would be equally objectionable to me, and all of the same opinion. I have owned dogs nearly all my life, and only a week ago spent an hour going around in the rain to find my hound, who had run away or been stolen. Most willingly would I pay a tax that would make dogs on a par with guns, so they could be considered personal property. It is unnecessary to say more about taxing guns, since I have your opinion, which is all the authority necessary, as V. admits his plan would be unpopular.

Speaking of grouse, I consider the fox and skunk its worst enemies, as frequent bunches of bones and feather met in the woods testify. Man has little chance with them in this vicinity, unless a good wing shot, for they rise wild, and fly like the wind. Generally they abide in swamps where the underbrush is so thick one can hardly turn around, let alone shooting them. The quail have all left this section long ago. I never saw but one, and he was feeding leisurely on a blackberry, so I left him: he was quite tame, and only about twenty feet from me. The best way to protect our parent stock is to enforce the game laws and exterminate some of the foxes and other vermin which prey on the birds. I am glad he approves the idea of farmers prohibiting sportsmen from shooting on their ground, and trust the same spirit of self-denial will keep him from destroying game in the wholesale manner indulged by some *sportsmen*. Thanking you, Mr. Verator, for your interest in the protection of game, and you, Mr. Editor, for acting as referee in the case, I remain, yours, DEXTER.

GUNS THAT BURST—FAULTY INSPECTION.

CINCINNATI, May 10, 1877.

EDITOR FOREST AND STREAM.

SIR: R. Price, in "The Two Americas," relates the particulars of the bursting of a double gun in his hands at the firing of a second shot at grouse, under circumstances which makes it seem to an American not a little singular that he should have taken no action beyond the plebeian one of accepting another gun from the builder, just as a laborer would take back to a shop-keeper a garment which had proven shoddy. He states explicitly that the gun "went to pieces," literally and destructively, and that his escape with his life was marvelous; that there was no apparent cause, but that on examination of the fragments, the builder declared that it was due to the negligence of a drunken foreman in boring the extractor. This maker, a fashionable one, tolerates a drunken foreman, and then permits his death-traps to go out without rigid inspection—without any inspection we'd better say—and a wealthy and influential sportsman, a nobleman at that, allows the damnable thing to go unpunished for a paltry bribe of another forty or sixty-guinea gun! Savoring of this same milk-and-water-policy was the conduct of a man here, owner of a fashionable rifle, which sent its charge into the face of the shooter. Luckily, he escaped with two sound eyes, and "compromised" with the principals, through whose fault the rifle had been sent out, by accepting a simple return of his money. This looks entirely too much like an acknowledgment that we are ready, for a paltry hundred dollars or for fifty pounds, to hold at arm's length a loaded bomb-shell with its fuse lighted. No; builders who, by reason of tolerating drunken or worthless inspectors, condemn to death innocent users of their infernal machines, should be held answerable to the uttermost; for—"*qui facit per alium*"—he who through another does a thing, does it himself. Prompt publication, in suitable cases, giving names, would check the inclination of some careless or conscienceless makers to send out uninspected pot-metal, R. E. DUCAIGNE.

LIGHT CHOKE-BORES VS. HEAVY GUNS.

GALVESTON, TEXAS, April, 1877.

EDITOR FOREST AND STREAM.

After a season's duck shooting on the Texas coast, using an 8-pound, 12 gauge, choked Fox gun, with an old 6-bore muzzle-loader, made by Westley Richards, ten years ago, I used the 12-gauge in preference, and got better sport. In fact, most of the time the 6-bore was stopped at the nipples, and when it was used there were more ducks wounded than brought to bag. With the choke the gun killed all that were hit, the ducks falling to the water like cannon balls. "Black-head" may say the choke-bore is a humbug, but, with Mr. Greener, I say he must have had bad luck in ordinary guns, or else some dealer has been selling him German guns with an English maker's name on them. Choke bores may not throw the shot where held, but I have yet to shoot a cylinder that has not the same faults. My choke bore shoots high, but I consider it a good fault. If they shoot to the right or left, a sportsman must find it out and be governed by it. American guns vary less than English, therefore I pronounce them the best. I had the pleasure of using a Nichols & Lefever one day last week, and found it as good a gun as the best by English makers. Their fastening is very strong, and decidedly an improvement on either the top or side lever. The compensator being in the leg instead of the hinge, meets the wants of many a shaky gun. It is my opinion that the wedge fasts, duplex and treble grips must look to their laurels, or Messrs. Nichols and Lefever must capture them. There may be something in confined gases, but to get the benefit the gun must be gas-tight at breech, or the choke will not hold it. I gave the new Fibre wad a trial, but I used four-ounce powder and got good results. Sportsmen want a wad half an inch thick, all the same size, then they can dispense with the uneven felt they've. Till then we must be satisfied. The sportsman of America are too intelligent to use a wad one sixteenth of an inch thick. B. R. B.

ELK HUNTING.—An Englishman is hunting in Colorado, and the kind of sport he is having may be surmised from this extract from a letter to *The Field*:

"The same evening was a red-letter one in our hunting career. We returned to camp laden not only with meat, but we had secured the head and enormous antlers of a giant wapiti. We three were walking abreast, a little apart, on the summit of a ridge where forest was open, when two great stags jumped up from their lairs in front of us, and stood for a moment, then trotted off between the trees, throwing back their huge antlers, soas to avoid the branches, till they touched their sides. We got bullets into them, and Jack and I rushed on with our knives; I gave one great fellow the *coup de grace* with my long hunting knife, the other, wounded, went off a little way and then lay down to die. It is not an easy thing to kill a stag wapiti. It takes as much tramping as to kill 100 couples of snipe, but far less powder; and there is much more meat for the ammunition in an elk. The labor is great, but the reward is great also; and any man or party who kills one by fair hunting through the forest in September may be proud. I will not say as much for the pot-hunters who wait till the herds are snowed out of their forest haunts and come down into the valleys in winter in search of pasture, when they may be ridden after and shot down like cattle. The biggest stag measured 16 hands 3 in. high, girth 6 ft., antlers with fourteen points, 9 in. round the burr, and 46 in. in length. They are not much bigger than my best sambur head; but the extra points make them look bigger."

ODOR FROM PERSPIRATION.—The unpleasant odor produced by perspiration is frequently the source of vexation to persons who are subject to it. Nothing is simpler than to remove this odor much more effectually than by the application of such unguents and perfumes as are in use. It is only necessary to procure some of the compound spirits of ammonia, and place about two tablespoonfuls in a basin of water. Washing the face, hands and arms with this leaves the skin as clean, sweet and fresh as one could wish. The wash is perfectly harmless, and very cheap. It is recommended on the authority of an experienced physician.

NATURAL BEAUTY.—All our moral feelings are so interwoven with our intellectual powers that we cannot affect the one without, in some degree, addressing the other; and, in all ideas of beauty, it is more than probable that much of the pleasure depends on delicate and untraceable perceptions of fitness, propriety, and relation, which are purely intellectual, and through which we arrive at our noblest ideas of what is commonly and rightly called intellectual beauty. Ideas of beauty are among the noblest which can be presented to the mind, invariably exalting and purifying it according to their degree. And it would appear that we are intended by the Deity to be constantly under their influence, because there is not one single object in nature which is not capable of conveying them, and which, to the rightly perceiving mind, does not present an incalculably greater number of beautiful than of deformed parts. RUSKIN.

—Oregon has adopted the ingenious device of requiring liquor drinkers to be licensed, and making it a penal offense to sell to an unlicensed person.

—Mr. H. H. Thompson, cashier of the Erie Railroad, has sent us a large part of a muscallonge which he received "in bulk" from Mr. Chas. Crossman, of the Crossman House at Alexandria Bay. The fish weighed thirty pounds, we are told, but are not informed whether it was net weight or catch weight. Our thanks are due to our friends.

SALT WATER PIKE.—We have some most valuable material in type on the salt-water pike of the Chesapeake Bay, which we shall use next week, the space for the current issue of our paper being occupied.

New Publications.

THE TWO AMERICAS. An Account of Sport and Travel With Notes of Men and Manners in North and South America. By Major Sir Rose Lambart Price, Bart., F. R. G. S. With illustrations Philadelphia: J. B. Lippincott & Co.

This agreeable work belongs, as its title reveals, to a class which has of late years increased with a rapidity which would be alarming were it not that every now and again a contribution is made by such an author as Sir Rose Lambart Price. In his "Notes of Men and Manners," and his references to religious and political institutions, if no great profundity is shown, there is abundant evidence of unprejudiced observation and English common-sense. We prefer to dispose of this part of the volume first, in order that we may afterward enjoy without interruption the "Accounts of Sport and Travel." In speaking of American corruption, the author gives expression to at least one opinion in which many Americans will concur. He attributes it to universal suffrage, to which "all the existing ills in all existing republics distinctly can be traced." Very naturally the author prefers the British form of government. He finds conflicting interests in East and West, which must eventually prove fatal to the Union, since there is no current such as that supplied by a "strong sentiment of loyalty to a reigning family," to counteract the tendency of sectional self-interest toward disruption. Here Sir Rose quotes Fisher Ames: "We will eventually become too expansive for Union, too sordid for patriotism, and two democratic for liberty." On the other hand, our author is loud in his praises of American hospitality, of our beautiful women; and of the military men he met he thus vigorously sums up his opinion: "Of all the good fellows in the world, I really believe the U. S. A. officers are about the best."

And now we may turn to the sporting author of the adventures. Here he is business-like and matter-of-fact, circumstantial and clear, and is not above stopping at times to relate a humorous incident. The following is a fair sample: While out shooting and meeting with but indifferent sport, he took to prospecting for gold, and explained to his attendant, Martin, that as the country was rich in the precious metal he might, whenever he saw quartz, find gold also. "Shortly after, and working back, I found him paddling about in a large splash of rain water, which had accumulated in a slight hollow on the mountain side. 'Hullo!' I shouted, 'what are you doing there? It's getting too late for dawdling.' 'I be a-looking fur gold,' was the answer.' 'Why, you muff,' I replied, 'you are seeking in a splash of rain-water that did not exist yesterday, and may be dry to-morrow.' 'Well,' he sung out, with a grunt of discontent, 'you said as how I might find it where I seed quarts, and I be certain shure there be gallons here.'"

The first sport Sir Price had consisted of quail shooting at St. Vincent. Though unimportant in itself, the day's shooting led to an important discovery, viz., that banana peel is a great improvement upon the conventional vine-leaf in the cooking of quail. The sea fishing at the same place was exciting but barbarous. An amusing description is given of "an hour's fair shooting" at a patriarchal goose in Patagonia. "The old story of the jack snipe," says the author, "who lasted a man two years, and was eventually killed by a friend to whom in a weak moment he afforded a day's shooting, and *Punch's* Frenchman, whose woodcock remained to him for the season, rose vividly in my mind as shot after shot was fired by H. and myself at this invincible old bird, who received our fusillade with the most extreme indifference. After each discharge he simply dived, swam a hundred yards or so under water before rising to the surface, and then, with the most *insouciant sang froid*, flapped his wings in seeming derision of our efforts before quietly settling down as if nothing had happened." One is almost sorry to learn that at last a cartridge from the Captain laid the tough old warrior low. A great deal of interesting sporting matter is woven into the narrative of the voyage along the Pacific coast. We are told how albatrosses are caught with hook and line, how the bull-fights of Lima are conducted, and how sleeping turtles may be caught near Cocos Island. The latter process, as practiced by the author, was very exhilarating, and at the same time very simple. Slipping quietly into the water he swam noiselessly to where his intended victim was sleeping in fancied security. The turtle awoke, but being a slow starter his pursuer drew up level and caught him by the hind flipper. Then came the tug of war. It was, as we are told, a regular case of "pull devil, pull baker," the devil—or rather the Baronet—ultimately winning by turning the turtle on his back. One of the most interesting parts of the book is devoted to California, and for a description of salmon fishing in the Sacramento we must refer the reader to the work itself. We can recommend it to every reader of FOREST AND STREAM as the narrative of one of the best type of a sportsman. Sir Price has his peculiarities of both language and sentiment, but these, although occasionally objectionable, in no way detract from the value of a volume which will make a most acceptable addition to a library boasting of nothing but Frank Forrester, J. Cypress, Jr., and a few others of our American classics.

In the *Naturalist* for April we find much that is instructive. Mr. Trouvelot contributes a valuable paper on the Use of Auteme in Insects, giving the interesting results of a variety of experiments made by him during his investigations on this subject. Mr. Barber tells us of the Aboriginal Funeral Customs in the United States, and Mr. C. S. Minot contributes an illustrated paper on the Sledge Microtome. Next comes an extract from Prof. Huxley's lecture on the Study of Biology, followed by Prof. Grote's paper On the Peopling of America. Capt. Howgate's article, entitled The Polar Colonization Plan, is very interesting, and we are pleased to believe that there is a prospect that some of his suggestions will be acted on. Of the Department of Recent Literature, Mr. Packard's illustrated review of the Geographical Distribution of Animals is, of course, the main feature. The notes on botany, zoölogy, anthropology, geology, geography, and exploration and microscopy are, as usual, attractive, and the number ends with a digest of recent scientific news, proceedings of societies, and the contents of current scientific serials.

We welcome with much pleasure the second number for this year of the *Nuttall Bulletin*. Certainly this periodical is doing good work, and it has really become a necessity to every ornithologist. We cannot but hope that it will receive the pecuniary support it so well deserves, and that before very long we shall be able to welcome it to our table at more frequent intervals than we now do.

The first article in the present number is a startling one. Dr. Coues, who is, we must say, rather given to such performances, demolishes in a few words the old genus *Seiurus*, and at the same time the specific names of the three species which belong to it; so now we must say and write *Siurus auricapillus*, *navius* and *motacilla*, instead of those other names, so long familiar to every ornithologist, *aurocapillus*, *noveboracensis* and *ludovicianus*.

We wish that we had the space to notice at length the most valuable articles on the Breeding of the Black Tern, and on the Wilson's Phalarope, by Messrs. Roberts and Nelson respectively. They are both extremely interesting, and contain much that is new. In this number, too, Mr. Brewster describes the nests of two Western birds hitherto unknown, viz.: *Carpodacus purpureus* var. *californicus* and *Peucaea ruficeps*, and Dr. Brewer comes bravely up to defend his list of New England birds. We shall wait with interest his critic's reply.

The general notes are as usual very interesting—that on the capture of the Egyptian Goose on Long Island especially so. The bird must have been an escaped one, we take it.

The *Popular Science Monthly* for April opens with one of Prof. Tyndall's lectures on spontaneous generation. It is entitled A Combat with an Infective Atmosphere, and details in a most attractive style the author's struggles with the impurities of the atmosphere while experimenting on his pet subject. Following Prof. Tyndall's article is an abstract of a lecture by Dr. Von Pettenkofer, Professor of Hygiene at the University of Munich, on the Relations of the Air to Our Clothing. This is the longest article of this number of the *Monthly*, and it is also the most interesting. As briefly as possible the lecturer gives us a vast amount of what will be to most readers novel information concerning our clothing and its relations to our health and comfort. Prof. Samuel Lockwood, in a brief article on Audubon's Lily Rediscovered, strikes a blow for the greatest artist-naturalist this country has yet known. It is too much the fashion at the present day to sneer at the work and the workers of earlier times, and we are glad to see a word said in defense of one of them.

The remaining articles are numerous and interesting, though as a whole the magazine seems to us a little more technical than it is wont to be. Prof. Tenney writes of the Plant Eaters of North America, mentioning, however, only the ruminants of our country; Ira Remsen discusses the question as to whether chemistry is a science or an art; Mr. Merriman tells us of World Creations, and Prof. Geike, F. R. S., of the Accoutrement of a Field Geologist. We commend especially to our readers Prof. Langley's First "Popular Scientific Treatise," and the discussion of the Ball Paradox by Mr. Crane. A fine portrait of William Crookes, the discoverer of the radiometer, adorns the first page of the *Monthly*.

DITTMAR POWDER.

PLEASE direct all letters for the above powder to Neponset, Mass. Capt. Bogardus and Ira Payne, now in England, are using my powder.
CARL DITTMAR—*Adv.*

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

E. K. AND F. H.—Is there a newspaper in London by the name of *Field*, *Forest and Stream*?—Ans. No.

J. & W., North Manchester, Ct.—You can prevent your gun from leading by first firing a blank charge of powder in each barrel.

H. D. M., New York.—You will find full information in regard to Hallock's *Sportsman's Gazeteer* in advertisement in another column.

F. C.—In what number did the article entitled "The Rangeley Lake Region" commence? Can you supply them?—Ans. No. 12, April 26th. We can supply them.

L. D. S., Philadelphia.—What is the price of a tent that would comfortably hold two persons, and where can I get one in Philadelphia?—Ans. Get an A tent of Pitkin & Thomas 71 North Second street, Philadelphia; price $8 to $12.

W. E. H., North Manchester.—Can you inform me where I can get plan directions for building the Barnegat sneak-boat?—Ans. Refer to back files of FOREST AND STREAM, in which they have appeared repeatedly, with diagrams.

T. R. C., Philadelphia.—There are no trout in Maine as large as the Rangeley trout, save the "Sebago trout," which are really the land-locked salmon, or a species of lake trout. The Maine trout are no larger than the Adirondack trout, averaging a half-pound in the best waters.

SUBSCRIBER, Brattleboro, Vt.—Will you please inform me if fishing for trout up the Green River, if not posted, is not all right? It empties into Deerfield River, Mass.—Ans. You must be governed by the laws of your own State. Massachusetts law cannot extend over Vermont waters.

C. CAMP, Georgetown, Col.—To obtain full information about the farming lands of Northwestern Texas, send for the *Texas New Yorker*, No. 23 Centre street, New York City, and write also to the Texas and Kansas Emigration agent of the Missouri, Kansas and Texas Railroad, Sedalia, Mo.

A. C. K., Brooklyn.—Can the Eagle Claw be called a snare? Would the taking of game with it be illegal, when the law prohibits the use of anything but the hook and line or gun?—Ans. The Eagle Claw is a trap, snare and "device" within the meaning of the law. If you use it illegally you ought to be prosecuted.

C. S. B., Albany, N. Y.—Can you inform me if there is any trout fishing in the vicinity of this city?—Ans. There are several streams in the vicinity, but too much fished to afford good sport. The best waters easily accessible from Albany are those about Prospect and Trenton Falls, on the Utica and Black River Railroad.

SHELL, Galveston, Texas.—Which do you consider the best implements for loading paper shells? Can the same be equally as well used for loading brass shells?—Ans. 1st. There are such a variety of loaders that it is difficult for us to decide which is the best. 2d, Some can.

SUBSCRIBER, Baltimore.—By your last issue I see that Mr. Hallock is about to give us a treat. When will his work on the "Game and Fish of North America" be out, and what will be the price?—Ans. The book is in press, partly stereotyped. It will make 600 pages, and cost probably $3.

W., Newark, N. J.—Is there any law to keep anybody from shooting small birds to stuff. I am getting a collection of birds and birds' eggs, but do not want to get into any trouble on that account. Also, what is the best monthly paper or book about such things?—Ans. Yes; you can shoot for scientific objects. Willard's *Ologist*, published at Utica, N. Y., is a good monthly.

A READER, Cleveland, Ohio.—1st. Do you soak shells and leaders in warm or cold water?—Ans. Either will do; warm water is the best. 2d. Can you tell me the nearest point from here where an old gentleman can go and find good trout-fishing, easily accessible, rate of board, etc?—Ans. The trout regions of Northern Michigan, reached via the Grand Rapids and Indiana Railroad. Send for their circular.

F. S. E., Boston.—1st. Where can I obtain a copy of the rules of the National Association of Amateur Oarsmen. 2d. Where can I get some black bass fishing near Boston, Mass?—Ans. 1st. Address Chas. S. Foster, Sportsman Office, this city. 2d. There is good black bass fishing at Jamaica Plains, Arlington, and many other places near Boston. The waters of Massachussetts have been pretty thoroughly stocked.

S. A., New York.—Is there any place in Pennsylvania where the trout fishing is superior to that of the Adirondacks, and do the trout attain a larger size in that State than they do in this?—Ans. We have seen large trout in both States, but don't think the fish will average more than one-fourth of a pound, as they run in either. There is as good fishing in parts of the Adirondacks as there can be found anywhere.

C. H. S., Montpelier, Vt.—Is there a law in New York State allowing people who are forming cabinets to shoot in any season for that purpose?—Ans. The law reads as follows, referring to the prohibitory sections 9 and 10: "The last two sections shall not apply to any person who shall kill any bird for the purpose of studying its habits or history, or having the same stuffed and set up as a specimen." A person detected in so shooting will have to prove his object.

W. E. H., North Manchester, Conn.—1st. Where can I get a copy of Baird's Ornithology? 2d. Is Prof. Baird getting out a new work on Ornithology—and if so, when will it be ready, where to be had and price? 3d. Is there any work on the subject you consider better than Baird's? 4th. Has Mr. E. Wanmaker returned from the South yet, and will you give me his address?—Ans. 1st. Of Settle, Brown & Co., Boston. 2d. We do not know of Prof. Baird's getting out anything new. 3d. No. 4th. He has returned. For his address see advertisement on another page.

DICK, Rochester.—Do you know of a place nearer here than Brainerd, Minn., where I can get a small quantity of wild rice, and how expensive would it be delivered in Rochester? Is there good trout fishing in Potter County, Pa? What is its reputation, if it has any at all?—Ans. You can get wild rice from A. V. Denio, Harwood P. O., Rice Lake, Ontario, Canada. The price, we think, is $2 per bushel. There is good trout fishing in all the branches of the Sinnamahoning River. Try Kettle Creek, which is reached by the way of Condersport, on the Delaware, Lackawanna & Western Railroad.

J. F. B., New York.—Last Sunday afternoon, in strolling along the bank of a stream running through the western edge of Passaic City, I noticed thousands of what seemed to be bits of twigs about an inch long and of the thickness of a lead pencil. They were laying upon the tops of the stones in the brook just as thick as they could well be without touching each other. Suspecting that the innocent pieces of twigs were more than they seemed from the position they occupied, I fished one up, broke it open, and found inside a white grub full three-quarters of an inch long. May I ask you what they are?—Ans. Probably the pupa cases of the caddis-fly.

TROUT, Pennsylvania.—Which is the best way to fish a mountain trout stream, up stream or down? and which is the best day, clear or cloudy? —Ans. Up stream or down depends so much upon the character of the stream to be fished that no general rule can be given. Don't attempt to fish against the wind is generally the best rule to follow. In fishing down stream the greatest objection obtains, that in playing a fish he disturbs a portion of the water below that has not been fished. As to the mere matter of casting, down stream is most convenient and satisfactory. Cloudy weather is the best for anglers.

YELLOW LEG, Boston.—A party of four wish to enjoy a fortnight's "marsh bird" shooting and trout fishing. We have been advised to go to Nova Scotia. Can you direct us to a suitable place? At what time of the year should we be there? Had we not better get our ammunition in the Province? Would we find better sporting by going to Prince Edward's Island?—Ans. Take stage from Halifax for Liverpool and beyond. There are twenty good locations on the route for trout, salmon and snipe. Chester and Indian River, forty-five and twenty-five miles from Halifax, are excellent spots, with good tavern accommodations. Buy tackle and ammunition at Halifax. Prince Edward's Island is an excellent place. Go to Rustico, on the north side of the island. Go at once, if you prefer.

UNDOUBTEDLY one of the best and cheapest stocks of Carpetings, Oil-Cloths, Matting, etc., etc., to be found in the United States is that of Messrs. JOHN H. PRAY, SONS & CO., Washington Street, Boston. L. W. Adams is the sportsman of the firm, and will take special pains to please any of our friends calling upon him, or with any orders sent him. It is a good, reliable house.—*Adv.*

FOREST AND STREAM

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

NO. 111 (old No. 103) FULTON STREET, NEW YORK.

[POST OFFICE BOX 2832.]

Terms Four Dollars a Year, Strictly in Advance

Twenty-five per cent. off for Clubs of Three or more

Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 50 cents per line.

*** Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, MAY 17, 1877.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notices of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Editor.

T. C. BANKS, Business Manager. S. H. TURHILL, Western Manager.

OUR NAME AND STYLE.

AS confusion seems to have arisen among our patrons as to the title of our consolidated journal, and some misapprehension in directing the letters and mail matter, we will endeavor herewith to define our position:—

Our united paper is known as the "FOREST & STREAM AND ROD & GUN." Intending that it shall continue to be the representative organ of Field Sports, Natural History, and Fish Culture in America (our most prominent scientists and literateurs having pledged themselves individually to its support), we have chosen to apply to it the qualifying sub-title of "*The American Sportsman's Journal.*" These designations appear on the cover. But inasmuch as we are working under the charter of "The Forest and Stream Publishing Company," which publishes books and pamphlets as well as this journal, it is especially important that all letters, not private, should be addressed to the "*Forest and Stream Publishing Company,*" and we enjoin upon our friends to so address them. The "ROD AND GUN" paper has been incorporated into the above company; but while it is a component part thereof, its own individuality will not be lost, and its old friends, who may be jealous of its prestige, will always see its name prominent on the cover, joining hands and labors with its quondam compeer, both working together for their mutual good and the benefit of all. The correspondence and letters from sportsmen of the "ROD AND GUN" will be distributed under their appropriate heads.

FRED BEVERLY IN THE TROPICS.—Last November, when our old Florida Commissioner, Mr. Ober, sailed for the French West Indies, we announced that he would remain two years in the tropics in pursuit of natural history subjects for the Smithsonian Institution. We were glad to embrace the unusual opportunity thus afforded to secure letters from a region of which so little of scientific value is known, and at once secured his services as our correspondent. Two letters from him have already been published, one from Bermuda, and one from Martinique, both of which were merely casual notes taken *en route*. To-day we present, however, the first of his legitimate series; and as these will be continued at intervals for a long period, they should be regarded with that estimation which their real value entitles them to. Our scientific academies will certainly scrutinize them with that interest which a new field always awakens, while those who look for more general topics will not fail to find entertainment in every line which his pen produces. Mr. Ober is one of the rising naturalists of the day who is destined to occupy a prominent place hereafter.

OTSEGO BASS AND OSWEGO BASS.

AS the result of the recent introduction of white fish into Otsego Lake, an interesting controversy has arisen between the champions of the renowned Otsego bass and the more enlightened of our fish cultrurists, the former objecting to their being put into the lake, chiefly on economic grounds.

Mr. Fred. Mather, of the New York Aquarium, has written for the *Aquarium Journal* a very intelligent article on the subject, which we are glad to endorse at his suggestion, and in doing so, we may be pardoned for publishing a paragraph from Hallock's forthcoming book relating to the subject in question. Messrs. Roosevelt and Green, of our State Fishing Commission, both maintain that the Otsego bass is a true white fish (*coregonus*), and Mr. Mather, in giving his endorsement, very truly says that any variety of fish bred in an isolated lake will, in time, divest the local peculiarities. In so saying he strips off the mystery that has for so long a time seemed to becloud and embarrass classification or identification, and the tendency of modern scientific investigation is entirely in the direction which this theory, or rather postulate, suggests. While generic diversity in fishes is more extended than in the human race, the fact remains that it is much less than students have supposed, the features and physical characteristics (not structure) varying greatly in both families, and to so great extent in man that scarcely two persons look alike, or have limbs, heads, hands and feet of the same size or proportion. Imperfect or superficial study is really the secret of our ignorance or misapprehension, and lack of careful or sufficient study is assuredly chargeable to very many scientists whom the public has been taught to accept as authority.

Returning to our original subject, we copy from advanced sheets what Mr. Hallock says on the bass question:

OTSEGO BASS; Otsego shad-salmon.—*Coregonus otsego.*—Although called a bass, this is a true whitefish. It belongs to the family salmonidæ, and not to the family percidæ. We append the description following from De Witt Clinton:

Body elongate, subcylindrical, compressed; back arched; scales very small; lateral line distinct, straight. Mouth small with a protuberant bifid upper lip. No teeth in the maxillaries, intermaxillaries, vomer, palatines or pharyngeals. Dorsal fin with nine (?) rays, three of which are imperfect; adipose filamentors at the tip; caudal forked.

Color, dusky above the lateral line; silvery beneath it. Dusky lateral stripes, as in the *Labrax lineatus*, or striped bass; these are about six or eight in number. Pupils black; irides silvery. Opercles silvery, spotted with yellow. It spawns in autumn.

The small-mouthed black bass (*Micropterus salmonidæ*-Gill) does not fill this bill at all, although there is great liability to confound it with the Otsego bass, from the fact that it is itself locally known as the Oswego bass, between which two proper names there is quite a similarity. While the Oswego bass or black bass is a voracious feeder and ravenous biter at the hook, the Otsego bass scarcely ever takes the hook. It appears to be peculiar to the Otsego Lake, just as the tront of Winnipissiogee Lake are peculiar to its waters. It has been taken in seines by several thousand at a time, but was rapidly decreasing in numbers until the year 1871, when the Fish Commissioners began their artificial propagation and the restocking of the lake.

In Mr. Mather's letter he shows what fish, having the second dorsal fin adipose, belong to the family of *Salmonidæ;* and he also shows that true bass must have spinous rays in the dorsal fin which the Otsego bass has not.

One other statement Mr. Mather makes, incidentally, which some people are quite incredulous about, namely: that whitefish are found in salt water. To substantiate his statement we will mention a fact which must be well known, but which has never been published, namely, that the following familiar fishes, comprising fifteen different varieties, and included in nine different families, are found at certain seasons every year in brackish water, and that as far as experience has tested and investigation discovered, all of them will live equally well in salt or fresh water, according as they are debarred from one or the other:

Percidæ.—Striped bass, white perch, black bass.
Saluridæ.—Catfish.
Esocidæ.—Pike, gar-fish.
Salmonidæ.—Salmon, land-locked salmon, trout, smelt, whitefish.
Clupidæ.—Herring, shad.
Gadidæ.—Tom cod.
Cyprinidæ.—Carp chub.
Sturionidæ.—Sturgeon.

Besides mullets and eels, there are many others that might be mentioned. Striped bass (the simon pure *porcus lineatus*) are found in Murdock Lake, above St. Louis. Shad have been taken 1,400 miles from the mouth of the Mississippi. Land-locked salmon, carp, sturgeon, garfish and smelts are found in fresh water that has no access to salt. The pike, white fish and black bass are found in salt water, in which the tide ebbs and flows twice daily. This interesting subject will bear extended examination.

—A sportsman here informs us that the quail (old stock) of Connecticut are one-third larger than any of those reported to this State. We were not aware of this.

NEW YORK, May 6, 1877.

In regard to my patent rough glass balls, I understand that there are instances where they have been ordered and smooth balls sent in their place. All parties ordering will find none genuine unless they bear lettered on each ball the name of "Bogardus' glass ball, Patented April 10, 1877," and further, that George E. Hart & Co., of Newark, N. J., are the sole agents for the wholesale trade for the glass balls and traps. I also take orders wherever I shoot. I have shot two matches of 1,000 balls each, and in the first I had to shoot at 1,136 smooth balls to break 1,000, and at the second I used my patent rough balls, breaking 1,000 out of 1,028. I know, by experience, that the shot will glance off from the smooth balls, as I have hit them with three or four No. 8 shot without breaking them. Respectfully yours, A. H. BOGARDUS.—*Adv.*

GAME PROTECTION.

STATE SPORTSMEN'S CONVENTION.—The coming Convention of New York sportsmen at Syracuse is in an advanced state of preparation. The use of the State armory has been granted for the combined fish and dog show, which is to be held simultaneously with the Convention. Mr. Chas. Lincoln, who has been superintending the great show at the Hippodrome in this city, will have charge of the dogs, and Mr. Henry H. Porter, Superintendent of the Island Pond Hatcheries at Half Way, will superintend the exhibition of fish. The committee on birds report that they have contracted for 20,000 birds, the largest number ever procured for a State shoot. It seems probable that they will all be needed.

PROTECTION IN GREENE COUNTY.—The citizens of Catskill and neighborhood have organized the "Greene County Association for the Protection of Birds and Fish," for the better enforcement of the game laws. Their circular states that they intend asking of the Board of Supervisors a small appropriation for the purpose of a trout-raising establishment, by which means every stream in the county can be fully stocked at a very trifling expense to each town. With streams well stocked with trout and the law enforced for their protection, they think that thousands of people who now seek the wilder parts of the country as a summer resort will be attracted to Greene County. An important suggestion is that owners of lands bordering on trout streams should preserve the trees and bushes along their banks, thus preserving the land from washing out by freshets, and affording a cool retreat for the fish. It would be desirable to throw into deep holes old stumps and bushes to make a refuge for the trout against illegal fishing. They also propose to procure a quantity of quail and prairie-chicken for stocking suitable localities, and suggest that a bounty be offered for every shade tree set out. This, in the long run, would probably be a profitable investment, as tending to prevent the drying up of the springs and the droughts which occur where a country is stripped of its trees. We wish the society success. The officers are: President, Andrew Breasted; Vice-President, P. H. Vanderhoof; Secretary, Frederick Hopkins; Treasurer, P. V. Van Orden.

DANSVILLE, N. Y., May 8, 1877.

EDITOR FOREST AND STREAM.

At a regular meeting of the Dansville Sportsmen's Association, held Friday, May 4, the annual election of officers was held, resulting as follows: President, H. J. Faulkner; Vice-President, John Hyland; Secretary, H. W. De Long; Treasurer, L. Kuhn; Finance Committee, Jas. Faulkner, Jr., B. T. Squires, and A. B. Van Nuys. The club is in a very prosperous condition, and during the two years of its existence has done much good work in protecting and propagating the fish and game of our beautiful valley and surrounding hills.

A notable feature of our last meeting was the presentation to the association by one of the members of a large case of mounted specimens of Florida beasts and birds. The gentleman, by the way, is a skillful taxidermist, and the specimens were all collected and prepared by him during a recent sojourn in Florida. They show great painstaking and study; and we are justly proud of our case, which is such a great addition to our rooms.

Wishing the "Great Consolidated" every success, I am yours,

H. W. DE LONG, Sec. Dansville S. A.

MICHIGAN.—The Legislature of Michigan has killed the Game bill prepared by the State Association, and it will now be two years before any changes can be made.

—"Ricardus" notifies us that a club has been formed in Fall River, Mass., under the name of "Woods and Waters Sportsmen's Club," for protection of birds and fishes. "We have nine mile of lakes abounding in pickerel, perch and black bass. The bass were put in Watuppa Lake eight years ago, and we have had very fine fishing, but the laws of our Commonwealth have not been respected; the fish have been gill netted and seined during spawning season; the club has taken the matter in hand, and are now offering rewards for conviction of persons fishing unlawfully. The club starts with sixty members. Rifle shooting is proposed, and we hope to show good scores for amateurs."
